THE

GARDENERS' CHRONICLE

A Weekly Ellustrated Journal

0F

HORTICULTURE AND ALLIED SUBJECTS.

(ESTABLISHED IN 1841.)

VOL. XX.-THIRD SERIES.

JULY TO DECEMBER, 1896.

LONDON:

41, WELLINGTON STREET, COVENT GARDEN, W.C. 1896.

BRADBURY, AGNEW, AND CO. LIMD., PRINTERS, LONDON AND TONBRIDGE.

INDEX OF CONTENTS.

JULY TO DECEMBER, 1896.

ABERDEEN, proposed botanical museum Abies brachyphylla, 521; A. nobilis, a specimen, at Coombe Abbey, 274 Abnormal Cattleya, 633 Abnormal plants, 661 Acalypha Sanderi, 392 Acanthophippium churneum, 266 Acidauthera bicolor, 393, 468 Acorus calamus, 16 Actinidia polygama, 466 Adenostylis albifrons, 727 Adiantum Farleyeuse, 749 Adverti-ement, an ancient and ludierous, 218 Aerides Lawrenceæ, 628 Agaricineæ, species of, 466 Agave ferox at La Mortola, 17, 521

Agaves in the Riviera, 157 Agricultural, budget, the American, 403; college, the Sussex, 431; re-turns, 566; statistics, 14

Aldenham House Gardens, theft of vegetables from, 248 Alder, to bud the, 212

Allotment culture, Silver Eurksian Medal awarded to, 726 Alocasia reversa, 466

Alpinia nutans, 167 Alps, the flora of the, 190 Alternation of generation 371, 397, 664 Altrincham Concert, 785

Amber, German, 334

American agricultural budget, 103; blight, and hydrochloric acid, 276; Grapes, 334; notes, 267, 620; seeds, 406, 620, 656

Ampelopsis Veitchi purpurea, 599 : under glass, 729 Angræcum sesquipedale, 749

Angaloa Clowesii, 434 Anhalonium Williamsii, medicinal pro-

perties of, 268 Antirrhinum, a dwarf type of, 220

Ants, paint used against the attacks of white, 193

Antwerp, horticulture round, 91 Apiary, 13, 69, 141, 245, 312, 399, 161, 527, 625, 691, 755

Apple, a large Bismarck, 726; canker, Oregon, 163; chemistry of the, 63; crop, the distribution of the, 242; maggot, the, 331; trees, formula for canker in, 630

Apples as food, 789 Apples with red flesh, 533 Apples and Pears, flavour in, 762 Apples and Pears, the gathering, storing, and profitable utilisation of,

Apples, how to keep, 46; at Mertoun House, 340; dessert, as decorations, 530; in Scotland, 341; well kept, 46 Apricots, the chemical constituents of,

Aralia chinensis, 663 Araujia sericifera and entrapped moth,

523, 664 Aristolochia gigas Sturtevanti, 183 Artichokes, Globe, 492 Artichokes, Jerusalem, and their feed-

ing properties, 111 Artocarpus integrifolia, 717

Ashford Gardens, Abberley Edge, 95 Asparagus decumbens, 697 Assimilatory iuhibitiou in plants, 371

Aster ericoides, 502 Asters as pot-plants, 404, 600, 665; perennial, 639

perennial, 568 Atriplex semibaccatum, the value of,

339

Auricula, the, 366, 751 Austen's, Mr. A. (poet laureate), garden,

Australia, practical fruit-growing in, 215 Australian plants, West, 523 Austrian Briar, a late-flowering, 568

Autumn, the last flowers of, 569; tints,

Azaleas and Rhododendrons, stocks

Azolla filiculoides, 248

BABINGTON, portrait of the late Prof. C. C., 564

Backhouse & Son, York, presentation to Messrs., 566

Bacteria in gardening, 528; upon leguminous plants, the effect of, 663 Baden-Baden, notes from, 391

Bad Nauheim, 487

Bamboos, the flowering of, 569 Banana, a wild, of New Guinea, 360; leaves, rate and mode of growth of, 248

Baubury, Ouions at, 338 Basing Park, Hants, 588 Basket work, and the use of Willows,

Basle, a botanic garden for, 134 Batoum, the vegetable industries or, 10

Bats, frugivorous, 276 Bean, dwarf, new varieties of, 215 Bean, Freuch, history of, 306; Scarlet-

ruuner, as a vegetable, 194, 243, 307 Beans, French, in winter, 400; Mr. Smythe's hybrid, 340; the new French climbing, 435 Beckenham Horticultural Society, the

educational influence of the, 756 Bedding in Hyde Park, the, 214

Bedding plants, dry weather, 270, 340 Bedford's, the Dake of, fruit farm, 61 Bedfordshire, a farm-school for, 16 Bee pest, the, or foul brood, 185

Bees, strange habitation for, 273

Beech woods on the Chilterns, the reason for, 782
Beet, 502; Egyptian, in Scotland, 532; trials at Chiswick, 369 Beets, round and tapering, 435

Begonia, propagation of the, 590 Begonias at Ferrières, 393; from beds, 341 Behria tenuiflora, 687

Belgium, notes from, 8, 91, 142, 272, Belgrove gardens, co. Queenstown, 278,

501 Benefit and Provident Society, United

Horticultural (annual dinner), 467 Benevolent Institution, Gardeness' Royal, 304, 403, 630

Bergman, retirement of M. Ferdinand,

Berkshire, the flora of, 434 Betula Maximowicziana, 160

Bignonia purpurea, 276 Birds and injurious insects, 20; the, and the gardener, 45; the sparrow and some other, 7; the house martin, 779

Birmingham Botanical, 334 Blackberry, the Wilson Junior, 297, 341 Bloomeria aurea, 687; B. Clevelandi, 687

Asters, German, new varieties of, 266; BOOKS, NOTICES OF: A Beautiful World, 694; American Grape-growing and Wine making (theo. Haussman), 331; An Introduction to Structural Botany, pt. ii. (D. H. Scott), 657; Annals of Cricket (II. Il'. Read), 18; Annals of the Royal Botauic Garden, Calcutta, containing Indian Orchids, 10; A Traveller's Notes (J. II. Veitch), 16; Botauical Magazine, 164, 306, 466, 630, 651; Carnation Culture for Amateurs (B.C. Ravenscraft), 17; Dictionnaire Icono-Revenserate, 17; Dictionaire leonographique des Orchides (A. Cographique), 624, 752; Dictionnaire Pratique d'Horticulture, 691; Die Getreideroste (Dr. Jacob Eriksson and Dr. E. Henning), 591; Famous Gardens abroad and at home, 727: Favourite flowers of Garden and Greenhouse (Ed. Step), 276, 785; Flora of the Black Hills of South Dakota, 638; Flora Capensis (J. G. Baker), 296; Florilegium Harlemense, 168, 466; Hand-list of the trees and shrubs grown at Kew 432; Hortus Boissieranus, 432; Hortus Boissieranus, 196; How to study wild Flowers (Rev. Gen. Henslow), 567; Icones Orchidearum Austro-Africanarum extra Tropicarum (H. Bolus), 752; Journal of the Lineau Society, 654, 694, 727; Journal of the National Horticultural Society of France (Chrysanthemum Section), 247; Kew Bulletin, 431, 499, 786; Les Crpages Orientaux (M. Guillon). 271; Le Chrysanthème, 103; Le Jardin du Crest (Marc Michelt), 44; Les Vignes Américaines, Adap-14; Les Yigues Americanes, Anapestation, Culture, Greffage pépinières (P. Viala et L. Ravaz), 368; Mauures Soil Nitrogen, and its Nitrification (Prof. M. P. P. Poherain), 429; Mouographia Phanerogamarum (Casimir de Candolle), 100; Nepenthes, a Cultural Monograph on the Species of (M. Jules Rudolph), 14; Official Catalogue of the National Chrysanthemum Society, 592; Plants and Flowers about the Home (Jas. Graham:, 164; Plants of Manitoba, 132; Ros Rosarum, 2nd edit. (E. F.B), 164; Soils and Moulds used in Horticulture (Geo. Trufficut), 296; The Disture (160, Tragatar), 230; The District Councillor's Hand-book (J. C. Swinburne), 17; The Flora of the Alps (Alfred Benaett), 190; The Flora of British Iudia, pt. xxii. (8ir J. D. Hooker), 752; The Flora of Dumfriesshire (G. F. Scott-Elliot), 752; The Flora of Dumfriesshire (G. F. Scott-Elliot), 257. Dummesshire (G. F. Scott-Ellor), 592. The Garden Annual, 757. The Genus Masdevallia, parts viii. and ix. (Miss F. H. Woolward), 490; The Lincoln Stamp Alban, 727; The Mushroom: How to Grow it for Profit (J. Cobban), 276; The Natural History of the Ancients Ther. G. M. Warkins, M.A., 585. The America and its Callage 788. The Orange and its Culture (Rapharl de Noter), 304; The Orchids of Burma (including those of the Andaman Islands) (Captain Bartle Grant), 568; The Orchid Review, 692; The Pansy (Aler. Lister), 164; The Plant Lore of Shakespeare (Henry N. Ellacombe, M.A.), new ed., 788; The Sources of Plant Food (E. Grif-fith Hughes), 17; The Student's Hand-book of British Mosses (H. Diron), 220; The Sturtevant Pre-

Linneau Library of the Missouri Botanical Garden, 16; Traité des Plantations d'Alignement et d'Ornement dans les Villes et sur les Rontes Departementales (A. Chargueraud), 100; Vegetable Culture (A. Dean), 752; Western Australian Year-Book,

Bordeaux Mixture, physical properties of the, 428, 159

Botanical addresses at the British Asso-

eiation meeting, 374, 397 Botanical drawings at the Natural History Museum, 270

Botanical gardens at Glasnevin, 89; at Birmiugham, 331; at St. Louis, 106; and the Cyclone, 72 Botonical Magazine wrappers, 651

Botany, common-seuse teaching of, 12:

Edioburgh, chair of, 17 Boxwood, the vegetable industries of,

Brambles in North Wales, 423 Brazil, notes on vegetable products in, 9 Bread, the alimentary value of white and brown, 346

Breeding, plant-, 327

Brevoortia Ida-maia, 687 British Association, botanical addresses at the meeting of the, 374, 397

British Produce Supply Association, 43,

Brodies, the genus, and its allies, 213, 238, 459, 687 Bromeliads, 100 Brougham Hall, Westmoreland, 329

Bruce Findlay, the late Mr., 335

Brun-vigias, 362 Bru-sels International Exhibition for

1897, 142 Budding fruit trees, 212; Roses and other subjects, 158; of flowering trees and shrubs, 270

Buddleia variabilis, 362, 468 Buds and grafts of fruit trees, 163 Bulbs, the best varieties of, as determined by the Dutch Bulb Society, 72 Burbank, Mr., as a hybridiser, 190 Burford, Dorking, Orchids at, 622 Burus, Robert, as a flower-poet, 181 Bushel-basket case, the, 370

C

Cabbage Palm fruit, 21

Cactus, a medicinal, 268 Caladium, curious variegated leaf in

Calceolarias, herbaceous, at The Grauge Bookham, 369 Calcium in plant chemistry, 402

Calcutta, Royal Botanic Gardens, 216

California, the cultivation of fruit in, 2068 Callas, dwarf growing, 468

Camellias, propagation of, in Italy, 494 Cambeusia maxima, flowering of, 596, 630

Campanula rotundifolia, 595 Canaigre in Mexico, 760

Canker in Apple trees, 790; formula for,

Cape, orchard-work at the, 523

Carnation disease, #33; disease, a new.

armotion disease, 950; disease, a new, 600; post, at the Cape, 192 farnation. Souvenir de la Malmaison, orizin of, 728; C. Priucess of Wales, 532

Carnations and Picotees, 186, 752; at Newstead Abbey, 103; at Warren House, Hayes, 91; from Worton Hall Gardens, 43; tree and Margaret, 632 Carpocapsa pomot ella, 11 Cassavas in Mexico, 718

Castlewellan, 683, 720

Catalpa bignonioides, the winged seeds

Catasetum tridentatum, fertilising-bee of, 633

Catchup, 789

Cattleya, a malformed, 562; abnormal, 633; C. aorea var. Statteriana, 556; C. Bowringiana, 656; C. × Brymeriana, 489; C. crispa, 216; C. Dowriana, 489; C. crispa, 216; C. Dowiana aurea marmorata, 425; C. Eldorado alba, 165; C. Gaskelliana alba, 94; C. Gaskelliana Bank House var., 63; C. intrieata, 8; C. labiata, 556; C. l. Mendeli "Her Majesty," 94; C. l. Warneriat Laeken 17; C. l. venosa, 697; C. × The Czar, 592; C. Lord Rothschild, 489; C. Mossie, peloria of. 8 at Mortabeke, 119. C. Lord tonsentid, 45 of the C. C. C. C. C. Schroderiana, 73; C. speciosissima, Erlsdene vars., 267; C. × super-Forbesi, 90; C. Warscewiczu, 8; C. Countess of Derby, 467; C. var. Shuttleworthi, 63

Cattleyas at Brussels, 530 Cauliflower, a funnel-shaped leaf of, 193

Ceanothus, notes on, 363 Cedar, commercial varieties of, 402; forests, the, of Mount Mlanje, 17 Cedars, the Harrow Weald, 186

Cedrus Deodara as a timber tree, 696, 729, 763; and other Conifers, 749 Celery, decayed, 790

Celosias at Regent's Park, 221 Cephalotaxus pedinculata, 697 Cereis Siliqoastrum, 695

Cereal crops, the rusts and mildews of,

Ceterach officinarum, 697; a native resurrection plant, 655

Ceylon Botanic Garden, 64; the botanieal department at, 594 Chamomile, wild, fatal to lambs, 106 Champs Elysées, Paris, 455

Chelmsford County School of Horti-

culture, 134 Chemistry of the Strawberry plant, 590

Cherries, early and late varieties of, 159; sixty eight in a hunch, 566 Cherry Governor Wood, 221 Cherry-tree, an old, 165

Cheshire, Hoticultural and Agricul-tural College for, 472 Chester, Art Club, 102; Horticultural Conference, 153; horticultural shows, 162

Chicle in Mexico, 759

China, the vegetable industries of, 10 Chionodoxa, the best varieties of, 72 Chiswick, meeting of the Fruit and

Vegetable Committee at, 162

Choisya ternata, flowering twice, 569 Christmas decorations, 787 Chrysanthemum bloom, a malformed,

600; blooms, the points of quality 600; blooms, the points of quarty of, &c., 633; chat, 531, 556, 592, 625; Pride of Madford or Beauty of Teignmouth, 569, 599, 632, 697, 729; Madame Carnot, sport from, 696; Madame Paul Lacroix, 631; Queen of the Earlies, 339

Chrysanthemum Society, the history of the National, 562; some recol-

lections of the, 553 Chrysanthemum, the types of the, and their characteristics, 602

Chrysanthemnms, 488; at Antwerp, 655, 662; at Ghent, 654; at Paris, 750; at Villa Victoria, Grasse, 688; a review of the past season, 782; cultural notes on, 396; dwarf, 501; new, 666, 696; in December, 728; hairy, 625; hints upon the culture of, 720; seasonable notes upon, 333, 500; setting up exhibits of, 633; taking the crown-hud in, 248; the terminal-bad in, 809; their culture for exhibition, 535

Chrysogonum virginianum, 366

Cider and perry industry, the, 437 Cirrhopetalum graveoleus, 210 Citrus species from seede, 10 Clandon Park, Madresfield Court Grape at. 193 Clematis erispa, 566; C. montana, &c.,

at Hatfield Priory, 500 Clip for suspending Grapes and Pears,

&c., 665 Cochet, Louis Scipio, 142 Coekroaches, how to destroy, 435

Cocoa tree, the, 789 Codlin moth, the, 11

Coffee-beans, artificial, 370 Colonial notes, 64, 122, 523, 594, 665;

borticulture, 660 Colour in flowers and fruits, experi-

ments concerning, 533, 633 Coloured leaves, and their use in plant economy, 265

Combe Abbey, Abies nobilis growing at, 274; Coniferous trees at, 749 Cones, morphology of Pine, 66:

Coniferous trees, contorted, 9: rare, at Lough Neagh, 661; at Combe Abbey, 749

Conifers at Fornham Park, 556; North American, in Germany, 187, 242; the layering of, 22

Conservatory, Col. Haltord Thompson's, 218; the new, at Sefton Park, Liverpool, 531

Constitution of plants, the, 756 Co-operative, the National, Festival, 246 Cornus sanguinea variegata, 366 Cornwall, vegetation in, 763 Cotton plant at Kew, the, 395

Couch-grass, clearing land of, 763 Covent Garden Market, fire in, 218 Cratægus punctata, 469

Creosote for dressing wood-work, 372 Crinum capense var., 106; C. yuccæflorum, 363

Crocus, the best varieties of, 72 Cueumber, a prolific, 174; disease, 227 Cupressus Goveniana, 624; C. McNabiana, 65; C. mierocarpa lutea, 469 Currant plantations around Patras, 396

Custom duties and neighbouring States, 434

Cyclamen, buils refusing to open, 569, 600, 697, 729, 759; culture in Germany, 632; cultivation of, 565; propagation of, 590

Cycnoches, 239

Cyphomandra fragraus, 210 Cypripedium, a triandrous, 686, 779; C. Chamberlainianum, 457; C. Charles-

Chaineriananum, 437 C. Cartes worthi, 622; C. insigne Sandera, 556, 657; C. × Leysenianum, 522; C. peloriate, 686; C. Sedeni, 267; C. semi-double, 686; C. villosum, 657 Cypripediums, classification of, 662;

hybrid, 435 Cyrtochilum micranthum, 63

Cyrtopodium Woodfordi, 555 Cytisus, Frivaldskyanus, 12

Dahlia, a quilled, 339; D. "Fantasy," Dahlias, certificated in October, 600

Dalmeny, Potato-growing experiments at, 692

Daplines, how to layer, 22 Darwin, decision to erect a statue to, iu

Shrewsbury, 628 Date fruits at Nice, 725 Decadence bogey, the, 281 Decorative use of flowers, the, 466 Delany's, Mrs., flower drawings, 164, 248 Delphinium Zalil, 238, 405, 468, 502 Dendrobium arachnites, 7; D. Dearei, 377; D. Hookerianum, 377; D. Jennyanum, 329; D. seeundum, 8; D. War-

dianum in a town greenhouse, 425 Dendrobium Wardianum at Highbury,

Dendrobiums growing upon bones, 748 Deodar with cones, 168 Dianthus, colours of, 21 Didymocarpus malayanus, 123 Dimorphotheca Eckloni, 362 Diospyros kaki, 395; D. virginiana,

hardy at Kew, 46

Dipladenia Sanderi, 652 Disa grandiflora, 276 : D. pulchra, 778 Disehidia hirsuta, 182 Disease of Larch, the, 93 Diseased Carnations, 633; Tomato, 74 Dock-leaves as food for pigs, 564 Doronicum plantagineum as a plant for

forcing, 338 Douglas Fir, the, 302; in Scotland, 371 Oracœua Hookeriana latifolia, 304 Dragon-trees, the land of the, 598 Draining woodlands, 428 Drawings, botanical, at the Natural History Museum, 270

Drought and newly-planted trees, 92 Dudley Lodge Gardens, 365

Dyed flowers as hutton holes, 467 Dynamite, death from the use of, 164

E

EARTHQUAKE, the recent, 786 Eastwell Park, Ashford, Kent, 777 Eastwood House and gardens, 719 Echeveria Purpusi, 698 Eczema caused by Romau Hyacinths,

Ediaburgh Botanic Garden, notes from, 276.591

Edinburgh chair of botany, 17; school of rural economy, 16

Eel-worm, some experiences with, 193 Egypt, experiments with fibre plants, in, 558

Emigrants, hints to, 102 Epidendrum glumibracteum, 210; E. Godseffianum, 377; E. xipheroides,

Epping Forest seen through American eyes, 220

Ericas, propagation of, 590 Erigeron mucronatum, 142 Erythea armata (misspelt in text), 424 Erythronium, the genus, 361

Esparto grass in Tunis, 370 Essex County School of Horticulture, 530

Eucalyptus calophylla, 661; E. coccifera, 695

Eucharis bulbs, planted out, 698; plants flowering thrice in the same year, 187

Eueryphia pinnatifida, 188 Eugenia malaccensis, 395 Euphorbia abyssinica, a large specimen

of, at La Mortola, 496

Events of the year, 784
Examinations in horticulture, 104;
result of the Royal Horticultural
Society's, 72, 628

FARMERS and the income-tax, 531 Farm-school, a, for Bedfordshire, 16 Fasciated Pea, a, 20 Fern, buds and bulbils, 331; genera tion, normal and abnormal,

spores, improved method of sowing, 730

Ferns, pereristate, 429; the propagation of, 657, 686 Ferrières, Begonias at, 393; Carnation

culture at, 689
Fertilisation of flowers by insects, 237; of plants, 327

Fertiliser, wood-ash as a, 762 Ferula fortida, 330

Fibres, commercial, 631, 751 Findlay Memorial Fund, the, 466;

the late Mr. B., 338 Finshury Park, London, 91 Fir, the Douglas, 302: in Scotland, 371 Fire in Covent Garden, probable, 193; actual, 218

Flavour, the, in Apples and Pears, 762 Flax and Hemp culture in England, 103

Flixton Hall and gardens, 403 Flora of Berkshire, 434; of New Zea land, 461; of the Black Hills of South Dakota, 638; of Venezuela, 434 Florists' flowers, 39, 186, 333, 366, 396, 488, 719, 751

Flower drawings, 164

Flower garden, the, 12, 41, 68, 99, 141, 161, 188, 216, 245, 272, 303, 335, 367, 398, 430, 463, 494, 527, 560, 595, 627, 659, 691, 722, 754, 783

Flowering-trees and shrubs, a sug-gested garden for, 401

Flowers and insects, 237 Food of crops, 98

Foreign correspondence, 142, 157, 467, 689, 759

Forestry, 92, 187, 242, 302, 333, 428, 502, 558, 689, 782; in Ireland, and the Recess Committee, 619

Formaldebyde, 193, 221, 277, 365 Fota, trees and shrubs at, 363 France, notes from, 536, 688

French Beans in winter, 500; viutage, the, 566

Fritillaria nobilis, 466; the best varieties of, 72

Frugivorons bats, 276

Fruit as feed, 436; at Edinburgh show, 695; erop, the United States, 566; erops, remarks upon the condition of the, 156, 183, 211, 241; report on the condition of the, 121 Fruit culture in East Suffolk, 769

Fruit, Dutch competition in, 531; farm, the Duke of Bedford's, 61; from Canada presented to the Queen, 661; growing in Australia, 215; home-grown and American, (51, 697; in California, the cultivation of. 368

Fruit, preservation, the best method of, 758; notes on planting bush, 162; register, 297; show, the, at the Crystal Palace, 400; the coming, 46; trees, buds and gralts of, 103; trees, liquid-manure for, 696

Fruits and vegetables, market measures for, 336; experiments in the drying of, 102

Gryng of, 102 Fruits under glass, 13, 40, 69, 98, 111, 161, 189, 217, 245, 272, 303, 33, 367, 398, 431, 463, 495, 527, 56, 595, 626, 659, 690, 723, 754, 783 Fuchsias, standard and trained, 135

Fungi, drawings of, at the British Mu scum, 166

GAILLARDIA aristata graudiflora, 97 Galanthus, the best varieties of, 72 Galinsoga parvi^pora, 194 Garden walks, traps in, 698; notes, seasonable, 301

Gardeners working hours, 243; friends, house-martins, 779

Garden-trainiog in Germany, 524 Gardens and rabbits, 94 Gitton Park, Reigate, 37

German amber, 334; Asters, new varieties of, 266

Germany, garden-training in, 52, 54; North American Comfers in 187, 242; glass substitutes in, 494

Gioger in Mexico, 718 Gladiolus Königin Wilhelmina, 43 : the best varieties of, 72 Gladioli, bybrid, for late-flowering,

Mr. W. A. GREEN, Horticultural Secretary.

EDINBURGH SCHOOL OF RURAL ECONOMY.

SESSION, 1896-97.

BOARD OF MANAGEMENT appointed by the University Court, the Highland & Agricultural Society, the Town Councit of Edinburgh, and Contributing County Conneils. Chairman—The Right Hon. J. P. B. Robertson, Lord Justice-General.

COURSES Of INSTRUCTION are provided both in DAY and EVENING CLASSES for FARMERS, GARDENERS, FORESTERS, and others interested in Rural Economy.

The SESSION begins in OCTOBER and ends in MARCH. Fees Specially Moderate. The Syllshus may be had from the SECRETARY Of the University Court, Edinburgh; or, from the SECRETARY, 3, George IV. Bridge, Edinburgh.

To Gardeners and Art Florists. Re A. B. ROOTY, in Bankruptey.

Re A. B. BOOTY, in Bankruptcy.

THE OFFICIAL RECEIVER herein is prepared to enter into negotiations for the SALE, by Valuation, of the whole of the STOCK-IN-TRADE, consisting of Palms, Ferns, Flowering, and other Plants, Seeds, &c., and a Choice Assortment of Porcelain and Fancy Articles (cost £410 18s. 94.); also the useful and well-appointed Fixtures, Trade Plant, &c. (cost £234 6s.)

The Purchaser to have the option of taking the Book Debts, which are all owing by respectable people, and are estimated to produce £110 4t. Id., if he desires to do so.

The Shop is in James Street (the principal street), in Harregate, and the Nursery is in East Parade, about half a mile distant.

distant.

So far as the Official Receiver is able to form an opinion, a good high-class business has been done for a number of years past, but Mr. Booty has not had sufficient capital to work it. There is a large and most respectable business connection and there appears to be no reason why a profitable trade should not be done by energy and a little free capital.

The Official Receiver is carrying on the business, and will be glad to answer any enquiries made to him up to Saturday, July 11, 1896, if not previously disposed of.

E. T. WILKINSON, Official Receiver in Bankruptcy, 28, Stonegate, York.—Dated June 27, 1896.

FOR ORCHIDS and GARDENERS to Grow them, apply to SANDER'S, St. Albans. The fines atock of Orchids in the World.—30 minutes from St. Pancras.

GEO. MARRIOTT, of Upper Edmonton, will be happy to EXECUTE COMMISSIONS for OROHIDS, &c., for Geutlemen unable to attend the Sales, and having had many years' experience his judgment may be relied upon.

Choice Vegetable Saeds.

FOR AUTUMN SOWING.

AND F. SHARPE will be pleased to give Special Quotations for their fine Selected Stocks of CABAGE, TURNIP. LETTUCE. ONION, RADISH, and other SEEDS suitable for AUTUMN SOWING, which will be found very advantageous to Purchasers. Also fine samples of WHITE MUSTARD, and Sowing RAPESEED, at moderate prices.
SEED GROWING ESTABLISHMENT, WISBECH.

SPECIAL OFFER.

PELARGONIUMS, — GARAWAY & Co. offer good plants, in 5-inch pots, of the best market and decorative varieties, at 15s. per dozen.

GARAWAY AND CO., Clifton, Bristol.

MUNGO CHAPMAN, late of Easter Dud-dingston Lodge, Mid-Lothian, begs to intimate to his friends and acquaintanies that he retires from his present situation on the 20th of the present month. He has arranged to reside at St. Ninians, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the manegement of one of the most choice private collections of placts to be found in the British Isles—that of the late Charles Jenner, Esq.—Mr. Chapman can confidently undertake to supply what is select and true to name of the most suitable plants for Bordere and Bock-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully employed in getting up Stock.

May 19, 1896.

Medals recently pen competition.

THE

Gardeners' Chronicle.

SATURDAY, JULY 4, 1896.

OLD AND NEW STRAWBERRIES.

TO-DAY, June 30, and on several other occasions, I had the pleasure of visiting the small garden at Warriston Park, Edinburgh, of Mr. John Carmichael, late of Sandringham, and well known as a fruit-grower and judge throughout the United Kingdom. Years ago, Mr. Carmichael was a leading grower and exhibitor of Heaths, Azaleas, and other hard-wooded plants, and a most successful raiser of hybrid Azaleas and other plants. In his well-earned leisure, he has now taken up the equally useful work of weeding out our long list of old varieties of Strawberries, and of adding some desirable novelties to our rather limited assortment of late varieties. With this end in view, he has crossed the variety Waterloo with Latest of All, Frogmore Lato Pine and British Queen, and he has succeeded in raising among others of great promise, the following . Princess of Wales, William Carmichael, Richard Gilbert of Burghley, named after one of the best Strawberry growers in his day in the kingdom. The Princess of Wales and Richard Gilbert were from Waterloo by Latest of All, William Carmichael, W. x with Frogmore Late Pine, and the Prince of Wales, which is a full fortnight later than either of these: Waterloo x with British Queen. The Prince of Wales variety promises to be later in fruiting than Latest of All. And all these new varieties possess the merit of vigorous growth, fertility, size of fruit, and good colour and flavour.

Few persons have more experience among Strawberries and other fruit than Mr. Carmichael, who has handed me for the use of this journal a list of twenty-five varieties recently proved by himself, weeded down to six, as worth growing. The figures are mere numerals, and not meant to measure relative merit. There are two or three names in the list that may surprise a good many Strawberry growers-these are John Ruskin, Garibaldi, and Vicomtesse Héricart du Thury-the first is, however, one of the finest Strawberries grown, treated as an annual. Neither of the two last ones, nor V. du Thury, is small and weedy as grown by Mr. Carmichael in his garden at Warriston Park, Edinburgh. Both the varieties here are true to name, and quite distinct; they were sent out in the same year as Garibaldi by Dickson & Co., Edinburgh, and the Visiomtesse II. de Thury by Vilmorin of Paris; and I have never seen the latter so fine as here, carrying an immense crop, the size, flavour, colour, all that can be desired. But it is more than time to make way for Mr. Carmichael's most interesting estimate of the merits of old and new Strawberries:—

" LIST OF VARIETIES.

1. Scarlet Queen, Laxton's.

2. Noble, Laxton's.

3. Competitor, Laxton's, inferior.

4. Sir Joseph Paxtou.

5. James Veitch.

6. La Grosse Sucrée.

7. Jubilee, Laxton's, inferior.

Duke of Edinburgh.

9. Lord Lyons, Cooling's

10. Burghley President.

11. John Ruskin, ought to be grown as an aonual.

12. A. F. Barron, Laxton's, inferior.

13. Latest of All.

14. Lerd Suffield.

15. Gunton Park.

16. Empress of India, British Queen.

17. Garibaldi.

18. Vicomtesse Héricart du Thury.

19. General Machone.

20. Frogmere Late Pine.

21. Oxonian or Eleanor.

22. Kitley's Goliah.

23. Waterloo.

24. Keen's Seedling

25. Royal Sovereign, Laxton s.

"I have discarded all of the above twenty-five varieties, except the following six:—

1. Scarlet Queen, Laxton's.

2. John Ruskin.

3. Garibaldi.

4. Vicomtesse Héricart du Thury.

5. Royal Severeign.

6. Waterloo.

"Garibaldi is, with few exceptions, the only variety grown by the market-gardeners in the neighbourhood of Edinburgh, but it is too small for the Loudon market. Sir J. Paxton is the one grown, but it will now be superseded by Royal Sovereign. Garibaldi was sent out some thirty years ago by Messrs. Dickson & Co., Waterloo Place, Edinburgh The same year Vicomtesse Héricart du Thury was sent out by Messrs. Vilmorin of Paris. They are considered synonymous by many, but they are quite distinct, and both excellent preserving varieties of Strawberries, and very productive and good in flavour. Garibaldi is a week carlier, dwarfer in foliage than Vicomtesse H. du Thury. When living at Dunmore (previous to my going to Sandringham), Mr. Mathieson (now of Meicklour) was then gardener there, and he observed in Vilmorin's Catalogue Vicomtesse H. du Thury advertised for the first time. He ordered five plants at 4 francs each. I got my stock direct from him, and he agrees with me that it is distinct from Garibaldi.

"Waterloo being the best late sort here in 1892, I crossed a single bloom with the old British Queen with a view to get the Queen flavour into Waterloo, and the colour of Waterloo into the Queen. I sowed the seed when ripe, and planted them out in 1893; in 1894 a few of them fruited. I succeeded in getting just what I wanted; in one of them in particular I have got the Queen shape and foliage, and the fruit nearly as deep in colour as the female parent Waterloo. The flavour is delicious, and it comes in to succeed the early sorts. In 1893 I crossed another bloom of Waterloo with Latest of All, and have got one fine one, which Mr. Cannell calls a gem; it fruited in 1895. In 1894 I made another cross with Waterloo and Frogmore Late Pine, which fruited in 1895. I got a few runners of it, and planted them out in August, and this year they are very prolific, finecoloured, and delicious in flavour. I believe it

will be a grand one for forcing judging from the mass of flower which it produced, and I hope to be able to exhibit them at the Drill Hall should they come in right for the meetings." D. T. Fish.

WITHIN THE FOUR MILES RADIUS.

Not all of our readers can fully appreciate the significance, from a horticultural point of view, of the expression, "within the four miles radius of Charing Cross." Very many of them can, however, and are aware of the difficulties under which the culture of plants and fruits, within doors and out-of-doors, is pursued in suburban gardens, in the London district, where fogs, smoke, and partial darkness are more familiar than friendly visitants. Gardeners, as a rule,

became evident that many other subjects were successfully cultivated there. Particularly is this the case in regard to the Peaches and Nectarines. There is a good lean-to Peach-house about 150 feet long, in several divisious, and the crops of fruit upon all the trees would have been praiseworthy if they had been cultivated in the heart of the country. The trees, also, though near upon thirty years old, are in excellent condition, and are furnished with plenty of young and strong growths. Mr. Harman, the gardener, is never troubled with bud-dropping, as he does no very hard forcing.

There are several vineries, where good average crops of Grapes are obtained, but some of the Vines should be replaced by young canes. Mr. Harman favours the practice of affording slight shade to the Muscats if bright sun should follow a few dull days during the flowering stage. Though this may be thought unnecessary by some of us, it does no harm,

Fig. 1. — CATTLEYA SKINNERI.

As grown in a suburban garden.)

though, soon find out from experience what plants absolutely refuse to be happy in such close association with Westminster, and they have a black list as a consequence.

Fortunately, most of the species of Orchids generally and erroneously) believed to be uncommonly difficult of cultivation, are more tolerant of a town atmosphere than numerous plants of a less aristocratic reputation. In fig. 1 is given a representation of a plant of Cattleya Skinneri, which has been grown in the gardens of A. D. Keinwort, Esq., on Grove Hill, Denmark Hill, S.E. During the latter part of May it bore ninety-six fully expanded blossoms at one time. As will be seen from the figure, these were on strong spikes, some of which produced nine blossoms, and all were well above the foliage. The plant has been grown from one of a pair of small pieces received from Central America about ten years ago. It is in an 18-inch pan, and has not been removed from this during the last six years. With its twenty leads and an abundance of flowers, it is a satisfactory specimen, and has been grown in a stove with other plants in a garden where Orchids are by no means a specialty.

On a recent visit to Mr. Keinwort's garden it

f r the bunches were very even, and the berries had set well. A few other houses accommodate plants of a miscellaneous character.

The vegetable garden is well cultivated, and the "bolting of Cabbages" has not been so prevalent here this season as at many other places.

Altegether, the site of the establishment is only 6 acres. The house stands on a high elevation, and the ground slopes from the back very steeply, and we were surprised to see the lawn during the drought so green as it was. From the back of the house there are excellent views; on the one hand may be seen the Crystal Palace, and on the other is a capital view over Honor Oak. It would be well to further improve the view of the Palace by the removal of a few trees, but retaining those in the centre for the sake of variety. The house and garden is a type of thousands that during the last half-century have been called into existence on every side of the metropolis.

DRESDEN EXHIBITION.—We are indebted to Mr. J. T. Seidel for a fine series of photographs taken at the late Dresden International Exhibition. The Azaleas are particularly fine.

THE SPARROW AND SOME OTHER BIRDS.

EVERY now and again we growers of seeds, grain, fruit, and flowers, are treated with much stale and decidedly wrong statements as regards birds, but more particularly the sparrow. It has been shown again and again how very untrustworthy these bold assertions are, and yet we are quietly told that we practical naturalists, agriculturists, gardeners, &c., do not know anything about the habits of birds, and are totally ignorant of their uses; but it has not been yet advanced that we know nothing of the dire havoc that many cause, besides the annoyance and positive loss, pecuniary and otherwise. I am led to write on the question yet once again, in consequence of an article which appeared in this paper June 6, 1896, p. 711. The writer begins by an attack on a Sussex sparrow club, which he says killed 5,922 sparrows and tomtits (?). And then he states that the caterpillars on the Apple trees, &c., would probably (why probably?) not have existed if the sparrows had not been destroyed. It is a very great pity that persons will continue to write

of caterpillars, also young buds, Peas, &c. The writer goes on to say, they not only destroy also the grubs of the Cabbage-butterfly, but the "flying insect itself." Now, unfortunately for me, my garden swarms with sparrows, and yet last year my Cabbages were more like cabbage-nets than theso much-approved vegetables, and although I was "on the watch," I never saw any sparrow-hawk at the butterflies or the daddy-longlegs (Tipulas), but I do not deny that they occasionally do this, for I have seen them; but to put it down as one of their good qualities is like calling a man generous who now and then gives a penny to a crossing sweeper. I am fully aware of the great damage the tipula grub does to the pastures, but the starling is the bird that feeds its young on them, not the sparrow. I have watched by the nest of a starling, and have counted that they brought to it from my pastures over eighty tipula grubs in one hour in the early morning. The sparrow, as far as my observation takes me, does not feed on the caterpillar that eats out the bloom of the Apple. The tits are the most valuable: I have noted them through "aiglass," especially the blue-tits

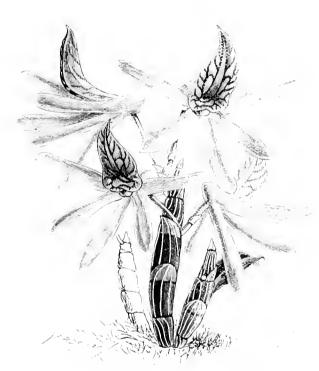

FIG. 2. DENDROBIUM ARAI HNITES . FLOWERS OFANGE

on this subject without studying sparrow life practically, and not come forward with bald unsupported assertions that generally rest on such as "it has been observed "-they do not state who observed -that the sparrow "feeds its young at the rate of thirty-six times in an hour for fourteen hours a day, and carries caterpillars and grubs by thousands in a week for some months of the year." Very well. All my life (and I am now in my seventy-third year of age), I say, all my life I have been a close observer of Nature, and perhaps of the sparrow as much as of any bird. If the sparrow feeds its young fourteen hours a day, it would begin possibly at 5 A.M., and finish at 7 P.M. Now, as a rule, like most grain-eating birds, it is not an early riser, nor have I ever known it to begin to feed its young until some time after 6 A.M., and soldom or ever has it continued feeding the whole day, but has rested at intervals, and generally ceased before 6 P.M., not making anything like twelve hours a day. Again, the sparrow is, as can be seen by the formation of its beak, a grain-eating bird, and not a feeder on insects, excepting at certain times. As to the young, they are generally fed on aphis for the first few days, then several kinds of insects, then grain or seeds in a green state is mixed in with some kinds

destroying the 'ova on the trees, and from me they have "a hearty welcome." True it is the blue-tit does spoil a few Poars at the ripening time, but he has well earned the privilege. The writer then goes on to quote Miss Carrington. Here is more assertion, and as such I leave it. Then the writer branches off from the sparrow, and speaks of Mr. Witherspoon liking all small birds in his garden. Just so. So do I, excepting the sparrow and the bullfineh, and of them I would have—noue. Then, again, he says, "Farmers and fruit-growers who slaughter and encourage the slaughter of birds are indeed warring against their best interests."

That may be the writer's opinion, but the farmers are not such ignorant people; they know quite as well as he does, and I believe a great deal better, what is useful and what is prejudicial. I was reading a book I have, published in 1610. Even then the sparrow was denounced, and in my younger days there were many sparrow clubs, and they were needful, as they are now. I am a lover of all wild life, and birds in particular, but I look on the sparrow in my garden as "a curse." I am told of its many virtues, but I fail to find them; they eat "they say" all kinds of caterpillars. Do they? My garden swarms with

sparrows; last year my large Oaks had every leaf eaten off by caterpillars. They pecked out most of the bloom-buds from my Gooseberries, and so with my Red Currants; they pecked off all the bloom of my yellow Crocus as fast as they appeared, and so with the bloom of my Primroses and Polyanthuses. They ate off my Peas as fast as they came up. I netted some rows, but when they began to growthrough the net they pecked out the eyes of the leaders; they ate the young Radish, the Turnips, they pecked out the young growths of my Pinks and Carnations; and when I feed my fowls, they come in "clouds" and carry off much of the food. Now, for all this, what good do they do me? I know of none. The thrushes, blackbirds, robins, white throats, fly-catchers, &c . do me a vast amount of good, and most of them no injury; but the sparrow is a decided pest, for he also drives away hedge-sparrows, white-throats, and gets into my martins' nests. What I want to know is, why are we perpetually having the sparrow thrust upon us, and a vast amount of unsupported assertion fostered on us, besides being told we are a parcel of ignoramuses, who know nothing of that to which we have given our best attention all our lives? and town-bred, townliving town's folk know a vast deal more of country life than we who live there.

A few years back a bird-catcher plying his calling near Lewes, Sussex, told me that he caught in a short time soon after the harvest 520 dozen of sparrows. Just think of the damage there must have been to the farmers' wheat-fields by these 6240 birds. Miss Carrington says, to quote your correspondent, that-almost without exception, every small bird eats at least one-sixth its own weight in twenty-four hours, and this food of birds consists, or almost entirely, of the worst foes to agriculture." It is a pity that humanitarians should be so unwise—not to use a stronger term. Harrison Weir.

DENDROBIUM ARACHNITES.

To the explorers and wayfarers in the tropics are we indebted for many pretty introductions to our gardens, and the showy little species illustrated is a case in point, the few plants which have yet appeared in gardens having been introduced mostly by persons who had gathered a few Orchids by tho way. The plant here illustrated was obtained by J. Bradshaw, Esq., of The Grange, Southgate, from one such traveller, and be exhibited it on two occasions at the Royal Horticultural Society under the provisional name of D. inversum (fig. 2). Its flowers are of a rich orange-scarlet, with purplish lines, and its whole aspect pretty enough, though scarcely of the quality to bear out the rapturous language of Prof. Reichenbach in the following description in the Gardeners' Chronicle' from dried specimens: "Since the time when Sir W. Hooker described his unique Dendrobium amboinense, no such extraordinary and gorgeous Dendrobe has been discovered. Imagine a dwarf stem 3 inches high, with shining internodes a little thicker at their upper ends, and then add a flower with linear sepals and petals nearly 2 inches long when dried, and a long pandurate lip narrower towards its obtuse tip. All these organs appear, when dried, whitish yellow, with a deep lilac blotch at the base of the lip. I have only a single flower, not cohering with the stem. To judge, however, by the little scars on the stem, it must be a Eudendrobium. I believe a single plant of it was found in Burmah by Mr. Boxall, who must have been filled with enthusiasm at the sight, since he dried it. One feels that the Burmese plants incline to the Malayan type, since it is impossible not to think of Renanthera flos-aeris (Arachuanthe moschifera). I was favoured with a flow r and two stems by Mr. Low. Of course, I can only describe the things as they are, and am unable to say that the stems may not become longer."

Perusal of the above leads me to wish that the "describe things as they are" were more evident and the speculative and irrelevant language less profuse.

There are several species with similar flowers, in colour like those of Lælia cinnabarina, yet to be

introduced, one of which, Dendrobium Jerdonianum. is illustrated in Wight., Icon., v., t. 1644.

To prevent confusion, it should be stated that the plant illustrated in Thouars, Orch. Iles. Afr., t. 88, as Dendrobium arachnites is net a Dendrobium, but Aëranthus arachnites. J. O'B.

BELGIUM.

THE June meeting at Ghent was notable for a large number of fine plants shown. The jury awarded Certificates of Merit par acclamation to Lælio-Cattleya Phæbe (Lælia cinnabarina × C. Mossiæ): the sepals and petals orange-yellow (a very rare colour), flower larger than that of L. cinnabarina, threat and lip bright claret colour and veined, suggesting C. Mossiæ. Cattleya Mendeli Duchess of Montrose, which, like the last exhibit, was from M. Jules Hye, is a variety with large flowers, sepals and petals very broad, colouring delicate rosy-white, lateral lobes of the white lip widely bordered with purple, anterior lobe of a still darker colour.

M. L. De Smet-Duvivier staged Lælia grandis tenebresa var. reginæ, differing greatly from the type, which was shown at the same time, and which also won a Certificate for its splendid colonring. The reginæ has very pale brown sepals and petals, the lip the beautiful and gay tint of L. purpurata.

M. le Marquis de Wavrin showed Alocasia gandavensis, a splendid variety, somewhat of the style of A. Sanderiana, but distinguishable by the veins, which are deeply tinged with dark purplish-red.

The following obtained Certificates of Merit à l'unanimité :- Calamus Carola and Alberti, the former seen at the Dresden, the latter at the Ledeberg Exhibition, the two varieties are very similar, and were frem Messrs. Sander & Co.

Miltonia vexillaria Hyeana has smaller flowers than the type, but they bear a deep and bright spot of purplish red in the middle of the lip. Odontoglossum mulus odoratum is notable for the size of the blooms. which are brown, the sepals and petals much spotted and speckled with yellow. These two Orchids came from M. Jules Hye.

Three varieties of Anthurium Scherzerianum won, for M. L. De Smet-Duvivier, each a Certificate; König Albert, with a large round spathe, dark carmine-red in colour; nobilis, the spathe large and round, very bright red; formosum, spathe a good size, clear carmine in tint.

M. Jules Hye showed also Miltonia vexillaria alba, all white, except that the base of the lip is lightly tinged with yellow; Cattleya Mossiæ Reineckiana, very beautiful; Odontoglossum hystrix, with a white lip, a rare variety, and a fine specimen with two stems bearing fifty fully-opened blooms; O. crispum météore, with well-rounded flowers covered with many violet dots, some larger than others, the flowers looking as if powdered with violet.

M. Charles Vuylsteke showed two fine imported Oncidiums, each plant bearing a fine raceme, one of all brown flowers, the other of brown flowers bordered with yellow, apparently of the unguieulatum

M. Pynaert Van Geert obtained a Certificate of Merit for Pteris Wimsetti, a Fern with a high market value in the future, the foliage elegantly dentated in a manner different to that of other Pteris cristata, the group to which it seems to helong.

Certificates for cultivation and flowering were awarded for Leptospermum scoparium and Rhyncospermum jasminoides from M. G. De Saegher, the former plant with 100 small flowers, the other specimen nearly 6 feet high by as many wide, flowering well; Miltonia vexillaria purpureum, with 100 flowers, from M. Jules Hye; Odontoglossum crispum from MM. Janssens et Cie.; and Euphorbia splendens, a very old plant, the specimen shown covered with brilliant red blossoms, from M. Bedinghaus.

The two last meetings of the Brussels Orchidéenne have been very successful. At the May exhibition Cattleya Trianæi var. Imperator took a first place; the jury considered it the most beautiful variety of

C. Trianæi ever etaged at the Orchidéenne. It was an exceedingly fine plant, the flower eplendidly coloured, especially the lip, which was all deep purple-red as far as the bottom of the threat. It was sent from Messrs. Lucien Linden & Co., of Meortebeck, and obtained a First-class Diploma of Honour à l'unanimité and par acclamation.

M. Madoux showed a fino series of varieties of Cattleya Mossiæ, among them alba, pure white, and marmorata, handsomely marbled with dark purple; Odontoglessum Wilckeanum var.; Cypripedium tenkinense var. album, the flower waxy-white and unspotted; and Cattleya Mendeli. There were alse some much-admired specimens of Odontoglossum crispum, Cypripedium, and Lælia purpurata, from M. Miteau; the same exhibitor sent Cypripedium Pauli var. eximia, with well-coloured flowers, the upper sepal well spotted with large purple marks.

There were a fine hybrid Cypripedium, a distinct variety, with the upper sepal spotted nearly all over with dark chestnut, from M. Moens; Dendrochilum lyratum, from M. Linden, the flowers suggestive of a lyre, and delicately coloured; Cattleya Mossiæ var. from M. Warocqué; Odontoglossums, from MM. de Moerloose and Dr. Capart : C. Mossiæ var. from Mr. Knight, a fine variety, the lip a beautiful orangeyellow; and many other good exhibits.

At the June meeting of the Orchidéenne, l'Horticulture Internationale M. Linden), MM. Madeux, Van Wambeke, and M. Massange of Louvres, showed fine exhibits, each winning a First-class Diploma of Henour for his collection of Orchids. M. Madoux sent some fine epecimens. His Lalio-Cattleya Clive is a beautiful hybrid, the divisions of the flower purplish-lilac, the lip as if cut from dark velvet, the flower well formed and spreading; C. Mossiæ alba is very white, the lip deeply fringed, white and citron vellow; the varieties of Odontoglossum crispum were very beautiful, one of them resembled O. c. Peetersii and Massangeana, the flower and raceme were in full beauty; others were noteworthy for the size of the flowers and of the markings. One variegated plant of Cattleya Mossice was remarkable as being the third time of its bearing blossems of a like kind; the foliage is variegated. Two fine plants of Cypripedium Rothschildiaum should be mentioned : one white, the other yellow; also a fine Cattleya gigas; a Lælia tenebrosa with broad petals; Cypripedium Curtisi, very distinct in form; a pretty variety of C. Stonei, and a beautifully-coloured Phalmnopsis Luddemanniana.

L'Horticulture Internationale sent a grand group of Cattleya Mossiæ and gigas, large and fine specimens, well bloomed, all good varieties, five of which were allotted a First-class Diploma of Honour. specially admired C. M. Pacha, for form; C. M. amplissima, for the size of the lip; C. Reineckiana var. exquisita, and C. gigas var. vernalis.

In addition to Cattleyas, M. Linden staged Acanthephippium Mantinianum, a new aud very curious species, and other Orchids.

M. Massange showed some Odontoglessum crispum, remarkable for the vigour of the flower racemes, the sizes of the blooms, and the pure white of many of them; six of the varieties won a First-class Certificate of Merit. Cattleya Mossiæ, from the same exhibitor, had flowers with flue, well-coloured lips. We learn that M. Massange has now in his houses no fewer than niue hundred blooming plants of Odontoglossum crispum, not counting three hundred trusses recently sent to Nice.

M. Van Wembeke's group contained many Odontoglossum crispum with pure white blooms. On one variety the lip was spotted all over with brown, save for a wide fringed margin of white. The same grower sent Masdevallia Harryana Hendersoni with forty bloems.

MM. Janssens & Cie. seut Odontoglossum erispum delicately speekled and other varieties with large spots.

Cochlieda Noetzliana, with four charming trusses of bloom, was staged by M. Miteau.

M. Flor. Pauwels sent Aërides Pieldingi var. album, a new white-flowered variety; Masdevallia Harryana,

Epidendrum macrobulbon, Lælia grandis var. tenebresa, Odontoglessum erispum, and various other plants.

Lælio-Cattleya × Pallas, a fine hybrid between C. Dowland and L. crispa, from M. le Comte de Bousies; Cypripedium × Thoerisianum, from M. Moens (hirsutissimum × superbiens); Cattleya Mendeli, Lælia purpurata and Selenipedium, from M. de Lombaerde; Cattleya Skinneri, with broad wellcoloured divisions; Lælia purpurata and Vanda tricolor were sent, as cut flowers, by Mr. Knight. Ch. de Bosschère.

ORCHID NOTES AND GLEANINGS.

PELORIA OF CATTLEYA MOSSIÆ.

An obliging correspondent from the Hague sends us a flower of Cattleya Mossiæ with four perianthsegments in two whorls, so that there were two sepals alternating with as many petals, the petals being lip-like in character. As usual in such cases, the column was straight, and the auther terminal, but imperfect.

CATTLEYA INTRICATA, Rehb. f.

A specimen of this pretty, rare, and somewhat puzzling Cattleya is sent from Sunny Hill, Llandudno, by Joseph Broome, Esq., who received it from Brazil as a new hybrid of Lælio-Cattleya elegans. The original plant described by Reichenbach also came over with L.-C. elegans, but by his recording it as Cattleya, we may presume that he found no trace of Lælia in the pollinia, and those found in Mr. Broome's flower are also those of a true Cattleya. The general appearance of the flower is such as one might expect to find in a eross between Cattleya intermedia and C. amethyetoglossa, but the lip bears little trace of the papillæ seen on that of the latter species. A probable explanation may be that it is a seedling reversion to Cattleya out of Lælio-Cattleya × elegans. The sepals and petals are white, suffused with pale yellowishrese, and bearing a few purple spots. The side lobes of the lip blush-white, tipped with purple; and the anterior lobe is bright amethyst-purple.

Some very fine flowers of Cattleya Warscowiczii, C. Mossiæ, and C. Meudeli also came with those of C. intricata, C. Mendeli being very distinct in the crimson-purple celour of the lip. The varieties exhibit the variation in the species, the large lightcoloured form having two broad patches of yellow on the lip, and the darker forms two small spets of

pale yellew.

AN ABNORMAL CATTLEYA WARSCEWICZII.

A singularly abuormal flower of Cattleya comes from J. Potter, Esq., Sligachan, Croyden. The two lower sepals are normal; and partly from the same plane, and partly from the inner whorl, and nearly in the same position as the upper sepal would occupy, appears a segment, consisting of sepal, petal, and labellum, and bearing on one side a petaloid blade, and on the other a similar formation, but coloured in part like the lip, while the middle portion is evidently a sepal. These two showy blades evidently account for both petals, although one petal and one sepal seem to be missing. The lip, which is very richly coloured, is perfect in form, but the column, which is flattened and curved upwards, has but the stigmatic disc, the anthers being wholly suppressed.

DENDROBIUM SECUNDUM,

if not a showy species, is yet a very pretty one, and a prefuse flowerer. A specimen of the plant is at the present time flowering in Messrs. John Laing & Sons' nursery at Forest Hill, S.E. The flowers. which are horne in short racemes, all face one way, are of a pleasing rosy-like colour, and the frout portion of the lip is of an orange colour. The sepals and petals do not expand, and the former are prolonged into a spur, which follows the lilac-coloured pedicels, giving the entire flower a remarkable appearance. The plant known in gardens as D. bursigerum seems merely to be D. secundum, whatever difference there may have been in the type specimen.

ONCIDIUM JONESIANUM VAR. FLAVENS.

The pretty Oncidium Jonesianum, although, like most other species of Orchids, varying in the quality of the flowers borne in different specimens, produces few which furnish an excuse for giving it a varietal name. One of the most distinct is O. J. phoenanthum, with flowers wholly of copper-red in regard to the sepals and petals. This plant is in Sir Trevor Law-rence's collection. Equal to it in beauty is O. J. flavens, which first flowered with Mr. T. Statter, and which is now in flower in Mr. Jas. Cypher's nursery at Cheltenham. It may be considered an albino in the same sense as the term is often applied to Cypripedium Lawrenceanum Ilyeanum and other species, in which all the other colours except pale green are suppressed. It is a flower with sepals and petals slightly barred with pale yellowish-green, a large lip of snowy-white, without the red marks on the erest and purple spots as seen in other varieties. J. O'Brien.

wonder the gardeners in those countries ask high prices for these quaint productions, and set great store by them! Few reach this country alive, and of those few it is seldom that any live long, deprived as they needs must be, of the patient, careful tending of the eastern gardener. It will be remembered by those of our readers who visited the last Temple Show that a collection of such Conifers was exhibited by Messrs. J. Veitch & Sons, of Chelsea, growing in the original oblong porcelain pots in which they were cultivated in some Japanese nursery establishment.

The dwarfing of plants by pot culture is a common practice in all countries where plants are grown under glass, as witness our Camellias, Azaleas, Oranges, Palms, Cycads, New Holland Acacias, Dracenas, Metrosideros, Callistemons, Eugenias, Melaleucas, &c., most of which rank as trees, but which are kept of moderate dimensions by pruning the roots and the branches, and cultivation in pots and tubs. Where we differ from the Jap and the Chinaman is

and continues to bear fruit for fifty or sixty years, it heing necessary merely to keep it clear of weeds and other vegetation. Two crops a year are gathered, that collected from May to July being the more abundant. The Para cocoa is preferred to all other kinds by the French chocolate-makers, to whom the entire production is shipped, with the exception of some small parcels consigned to Hamburgh and New York. The French market consumes about 6,000,000 kilos. of which Para is at present able to supply only about 3,050,000 kilos. Para cocoa is more appreciated than any other at equal prices. The skin is lighter, it is less subject to break, and the paste absorbs more readily the perfumes with which it is customary to impregnate the chocolate.

With the view of stimulating and encouraging the increase of plantations and improvement in the preparation of cocoa, the Government has reduced the export duty from 10 to 4 per cent., conceding also valuable premiums to the new planters. The lands

Fig. 3.—contorted and dwarfed conifers.
(Exhibited by Messes, J. Veitch & Sons, at the Temple Show, 18.6.)

CONTORTED CONIFEROUS TREES.

THERE are fashions in gardening in Asia, as well as in the western countries of the Old World, and those of China and Japan strike us westerns by their grotesqueness, formality, and the extreme of artificiality employed in the production of the desired We observe these peculiarities in their efforts to introduce petty alpine effects in garden scenery, in the needless intricacies of the shore-line of a lake or streamlet of perhaps very tiny dimensions : in the pebble-laid paths made to represent the sea-shore, the gigantic stepping-stones laid across a mock rivulet, whose water is not deep enough to reach to one's ankles; and the irregular-shaped flattish pieces of rock sunk in the course of a path, where we should simply employ gravel or concrete. But for perverted ingenuity of a high order, we must turn to the specimeus of contorted Conifers, of a great age in many instances, whose height and breadth may, however, be measured by inches. What ceaseless attention in the matter of pinching, stopping, training, watering, &c., must these miniature trees have cost their cultivators, how carefully must they have been watched in all those years-perhaps throughout a century, to prevent the mishap of a pot-plant getting dry at the root and perishing therefrom. No

in our not keeping these plants alive and healthy to an extreme old age, and in not giving them the true arboreal form, except in the case of Palms, Cycads, and Dracenas.

NOTES ON VEGETABLE PRO-DUCTS, TAKEN FROM CONSULAR REPORTS.

Brazil.—In the State of Amazonas, the chief natural products are india-rubber, cocoa, anit (indigo), vanilla, aromatic and medicinal fruits and plants, cloves, Brazil-nuts, hides, balsam of capivi, piassava, sarsaparilla, and a great variety of excellent woods. During the first six months of 1895, Amazonas exported 5,257,089 kilos. of rubber from various districts, iocluding 481,557 kilos. from the Brazilian side of the river Javary, the boundary line of Peru.

The natural products of Para are rubber, Rice, cocoa, coffee, mandiocea, aromatic (tonga) and edible Beans, Brazil-nuts, Maize, tobacco, honey, woods, sarsaparilla, and vegetable ivory. The natural conditions of Para aro most favourable to the production of cocoa. It can be cultivated in all parts of the State, but it is especially abundant on the banks of the Rivers Amazon and Tocantins. Its cultivation presents no difficulties, but it requires to be carefully tended. It begins to yield three years after planting,

granted to colonists in different parts of the State are all suitable for the cultivation and preparation of this valuable production, which offers a most remnnerative return on the capital and labour employed. As already remarked, the plant appears to require considerable care and attention, being sensitive to the influences of temperature, and the harvests are much affected by the great river floods.

The reduction in the rate of export duty has stimulated its cultivation, but there is an insufficiency of labour. The trade could be greatly increased by improvement of the plantations already in existence; and probably fresh planting with Venezuela and Trinidad seed in dry land properly prepared in places which are not exposed to the disastrous floods, would give successful results.

Brazil-nuts are exceedingly abundant in the forests of Para and Amazonas, where all who like may go and gather them. In the interior of the woods are net districts to which no one has yet penetrated, the harvests being derived almost entirely from trees met with on the banks of the rivers. Formerly the nnts were exported in the pod, each containing eight to ten, but now they are shipped loose.

NAPLES: Tobacco.—A good deal of Tobacco is grown in Southern Italy, but the growers are very much hampered in their operations by the excise officers, who count not only every plant, but every leaf, thus-

making their transactions with the growers exceedingly complicated. The present Minister of Finance has taken steps to extend the culture of Tobacco in the Nocera district, and plants from Virginia, Kentucky, Sumatra, and other places have been introduced. A school to give theoretical as well as practical instruction in the cultivation and preparation of tobacco is shortly to be established at Nocera, and it is hoped that the instruction given there may enable Italy to provide her sons (and daughters) with a less evilsmelling weed than they are compelled by their paternal government to consume at present. The request for the encouragement of Tobacco-growing has long been urged, and it is to be hoped that it will, in a measure, relieve the grave agricultural depression from which this wonderfully productive country has been so long suffering. The retail tobacconists are crying out very loudly at their diminished profits. They complain that the price at which the tobacco and cigars are fixed does not afford them a sufficient margin of profit, that snuff-taking, once so common in Italy, is a practice confined to the clergy and not universal even with them, and that the number of shops has been unduly increased, while the consumption of tobacco has been declining.

BATOUM. - The industry in liquorice - root and paste is said to be in anything but a flourishing condition, for besides foreign competition and low prices, brigandage seems to be carried on to such an extent, that even a liquorice factory is sometimes placed in a state of siege, as will be seen from the following account of a determined attack made in the early part of last year on one of the factories standing within 200 yards from a railway station on the borders of the two Governments of Elizaretpol and Baku. The attack was made during the night by a strong band of brigands, who were well armed with modern rifles and other weapons. They succeeded in getting within the high walls surrounding the factory; they promptly surrounded the factory itself, where work is carried on night and day, as well as the dwellinghouses of the owner and his European employés, and the row of buildings in which the offices are situated. They opened a hot fire upon all these buildings simultaneously, thus preventing any intercommunication or mutual assistance. On the dogs raising an alarm, the owner of the factory went into the verandah and called one of his watchmen, when a perfect hail of bullets whistled past his head, and the watchman was shot dead on the spot. A hot fire was then opened on all the buildings, and besides this a running fire on the railway-station was kept up, and even the Batoum-Baku passenger-train, which came into the station during the attack, was fired into, without, however, any of the passengers being killed. The brigands made an entry into the office of the factory, and after three hours' work, during which they kept up a furions fusillade, succeeded in breaking open the iron safe, from which they stole about 18,000 r., and then made off, the band breaking up into small parties, one of which was intercepted next day, at a considerable distance from the scene of the attack, by a party of Cossacks, and five of the brigands were killed. Some of the Cossacks also fell in the enencounter. Most of the brigands concerned in the outrage are reported to be still at large, and further murders and outrages are of frequent occurrence in the district, and the authorities are quite unable to suppress it.

Boxwood. —Referring to Boxwood, it is stated that, although all the private forests of Boxwood have been exhausted, and the Government up to the present still refuse to sell or allow Boxwood to be cut in their extensive forests throughout Aokhasia, consequently the total exports from the Caucasus have not exceeded 1200 tons; and further, this wood is fast losing its importance to the English manufacturer, owing to the fact that in recent years other hard woods have been discovered which are equally suitable for making many articles for which Boxwood was formerly used. Besides this, Boxwood from other countries also finds its way to the English market in increasing quantities.

CHINA: FOOCHOW .- Under the head of Oranges, it is said that the loose-skinned or Mandarin Orange grows in profusion throughout the province, and is exported hence to the other treaty ports of China. Although Oranges would not stand the voyage to Europe, yet the products of the fruit would. At Foochow there is not only an unlimited supply of Oranges, but of sugar also, and labour is about as cheap as it well can be. The institution of a distillery to make a liqueur of the nature of curaçoa, or of a factory to make marmalade and preserved Oranges, might not impossibly form a paying concern.

(To be continued.

THE REPRODUCTION OF THE ORANGE FROM SEED.

(Concluded from vol. xix., p. 785.)

Grape-fruit and Shaddock (CITKUS DECUMANCE).—The fruit commonly known in the United States as the Grape-fruit, or Pomelo, a smooth, round GRAPE-FRUIT AND SHADDOCK (CITRUS DECUMANA). rink, is always reproduced the to the seed. This is so well known to growers of this State, that they never have any hesitation to allow the trees to grow to maturity as seedlings. I have tested the fruit of many seedling trees in all portions of the State, and have almost uniformly found it of good quality. Only a very slight variation can be found commonly between the fruit of such seedlings. The Shaddock, so far as I have been able to learn from growers, also reproduces true, through the seed.

THE CITRON (CITRUS MEDICA).

Florida growers have had but little experience with this species, and I have been unable to learn anything regarding its reproduction through the seed. Of this species Gallesio says, "We have seen the Citron tree of the Jews (Citrus medica cedra) reproduced constantly from the seed. It has many seeds, the greater part of which always give Citron trees having constantly the same characteristics in aspect, form, and properties.

LEMON (CITRUS LIMONUM OR C. MEDICA LIMONUM).

This species, while not extensively grown in Florida for commercial purposes, is yet cultivated to a considerable extent. Many growers may be found who have grown lemons from the seed, and, almost invariably, the testimony is that the fruit from the seedling is comparatively the same as the fruit from which the seed was taken. No other result has, so far, come to my knowledge. Of the common Lemon Gallesio says," It is reproduced constantly from the seed, and its peculiarities are perpetuated to its descendents. When Lemons are grown in Florida for commercial purposes they are almost invariably budded to improved varieties. In Ecuador and Haifa (Asia) they are reported as commonly propagated from

LIME (CITRUS LIMETTA OR C. MEDICA ACIDA).

The common Lime also is reproduced constantly from the seed, commonly, if not invariably, transmitting its peculiarities to its descendants. In the extreme southern part of Florida and on the Florida Keys, thickets of seedling Limes escaped from cultivation have sprung up in waste places, and these, so far as I have been able to learn from inquiry and personal examination, invariably produce fruit of about the same character. In this section, where Limes are grown quite commonly, they are mostly propagated from the seed. Professor Lelong says:
"The Lime comes true from the seed, the seed "sport" only in exceptional cases."

MANDARIN ORANGES (CITRUS NOBILIS).

The principal varieties or sub-species of the Mandarin Oranges cultivated in Florida are those known as the China (commonly called "Mandarin"), Tangierine, King, and Satsuma. Of these the China and Tangierine varieties are not unfrequently propagated from the seed, and usually produce fruit true to the parent variety with but slight variation. In all cases, so far as I can learn, fruit of a characteristic Mandarin type is produced. Seeds of the China ("Mandarin") reproduce the China variety with slight variation, but are said by some growers not to be so desirable for market, owing to a tendency to form an elongation of the rind at the calyx, which makes them awkward to pack. They also do not average equal in flavour to the selected budded fruit. One very intelligent and critical grower tells me that seeds from the China frequently produce Tangierines. I have had no opportunity to verify this statement. Tangierine seedlings reproduce fruit the same or but slightly different from the parent. The Tangierine most commonly propagated here is a selected seedling known as the Dancy Tangierine. The Satsuma and King are also reproduced true by

KUMQUAT (CITRUS JAPONICA).

Two varieties of this species, one with elliptical fruit and the other with round fruit, have been introduced into Florida, and are grown to some extent.

I have eaten the fruit from several seedling trees, and find it to be the same comparatively as that from the budded trees. The owner of these assured me that they produce fruit the same as that from which the seed was taken.

TRIFOLIATE ORANGE (CITRUS TRIFOLIATA).

This Orange, the fruit of which is not used, has not been changed materially by cultivation and selection. It invariably reproduces seedlings having the same characteristics, so far as can be observed. I have observed hundreds of seedlings from one trifoliate tree, which stands in the midst of a large Orange grove, isolated from all other trees of this species. It is surrounded by sweet Orange, sour Orange, Lemon, Grape-fruit, and Mandarin trees, all bearing, and yet every seedling observed had the characteristic foliage and twigs of the trifoliate Orange. The seedlings have not yet fruited, so I can only speak as to the foliage and twig characters; but if hybridisation had occurred in any instance, it could not be observed in these. As many of the surrounding Citrus trees are always in bloom at the time this tree blooms, there would seem to be every possible chance for hybridisation to occur.

VARIEGATED ORANGES.

While the reproduction of variegation through seeds introduces an entirely different question, it will yet be interesting in this connection to state that through the seed. I have twice sown a quantity of seed from fruits of variegated Oranges taken from two different trees of Citrus bigaradia, and every seedling produced, about twenty in each case, was entirely white throughout. entirely white throughout. With the utmost care I was unable to rear any of these. The majority of them formed three leaves, reaching a height of from 2 to 3 inches, but all finally died. A few formed a fourth leaf. The variegated sour Orange trees, from which the seeds were taken, had the leaves beautifully mottled with white, about half of the leaf usually being discoloured. The rind of the fruit and the branches also showed the variegation very plainly. Herbert J. Webber, Special Agent, United States Department of Agriculture, Subtropical Laboratory, Eastis, Florida. usually being discoloured.

INDIAN ORCHIDS.

THE fifth volume of the Annals of the Royal Botanic Garden, Calcutta, edited by Dr. G. King, F.R.S., contains figures and descriptions of a century of Indian Orchids, by Sir J. D. Hooker, K.C.S.I., most of which have been previously described in the Flora of British India. An introductory note explains that the drawings, which are reproduced by lithography, consist of a small selection from the magnificent series of Indian plant-portraits by native artists that have been accumulating in the Calcutta Botanic Garden for nearly a century-a collection commenced by Dr. Roxburgh before the end of the last century, and steadily added to down to the present day. The Orchids of this collection number about a thousand, and these were lent to Kew by the Bengal Government in order that Sir Joseph Hooker might utilise them in preparing the Flora of British India, and a hundred of the more interesting ones were selected for publication in the work in question. The author remarks, that excellent as the drawings are in many respects, as representatives of the plants portrayed, they err in manifesting that tendency to enlarge which is a besetting sin of Indian botanical artists, and that the analyses leave much to be desired in the

^{*} Said by Dr. Morris (Garden and Forest, 1896, p. 164) to be the Forbidden Fruit of the West Indies—the Citrus Paradisi maliformis of Macfadyou's classification.

† "Henit Culture in Foreign Countries," in Special Consular Reports, Washington, 1890.

‡ Lelong, B. M., "Propagation, Budding, Grafting, and Appliances". Ann. Rep. Col. State Board of Horticulture for 1891, p. 143.

matter of proportion and accuracy, though in no case do these defects detruct materially from the value of the illustrations as a means of identifying the plants represented. Exact copies of the whole Calcutta collection of drawings of Indian Orchids have been made, at the expense of the Bentham Trustees, and are now deposited at Kew.

The drawings reproduced in the work in question represent, for the most part, species of hotanical interest, and are not in cultivation, though a few are more showy, and some are met with in gardens. They include eighteen species of Dendrobinm, of which D. erocatum, Hook. f., belonging to the Pedilonum group, has deep orange flowers, and a very long spur; while D. Williamsoni, Rehb. f., D. aurantiaeum, Rehb. f., D. palpebræ, Lindl., and a few others, are sometimes seen in gardens. Phakenopsis mishmiensis, Rehb. f., is a fine thing, with rose-coloured flowers; while Phalænopsis tetraspis, Rehb. f., P. Manni, Rehb. f., and Sarcochilus Berkeleyi, Rehb. f., are also familiar. Examples of nearly all the representative Indian genera are included, and as the drawings are partly coloured, and are accompanied by analytical drawings, they will be invaluable aids to the identification of these interesting plants.

A recent number of the Journal of the Asiatic Society of Bengal contains a paper by Dr. King and Mr. R. Pantling, entitled, "Some New Orchids from Sikkim." It contains thirty-three new species, which have been discovered in Sikkim during the last few years, chiefly by Mr. Pantling. There are six species of the enrious genus Oberonia, and most of the species are chiefly of botanical interest. R. A. R.

THE CODLIN-MOTH.

(Carpocapsa pomonella, L.)

THE Board of Agriculture has issued a seasonable leaflet on this very destructive moth, and which we are enabled to illustrate by the accompanying woodcuts.

"This is a very small moth, but its caterpillars are exceedingly destructive to the Apple crop in some seasons. They bore into the fruit, and cause it either to drop prematurely or to decay rapidly when it is stored. Sometimes Apples attacked by this insect drop off as early as the end of June, and continue to drop throughout the summer. Upon examining the Apples that have dropped, or those that show signs of decay in the Apple-house or store, it will be seen that there is a dark spot at the blossom-end of the Apple; a small orifice can also be detected there, round which there is a collection of excreta and minute morsels of Apple. If such Apples are split in halves, a passage can be seen leading to the ovaries or pip-centres, around which there is usually a mass of 'frass'; and it will generally be found that the pips, or parts of them, have been eaten. If the caterpillar is still in the Apple, it will be found near the pips, which appear to be the objects of its attack. If the eaterpillar has forsaken the Apple, a hole will be found on one or other of the sides of the fruit, through which it has escaped.

Though this is called the 'Codlin' moth, it by no means confines its attacks to Codlins, but was probably so-called because Codlins and some of their varieties, the Keswick Codlin, for instance, are somewhat early, and, being large Apples, make a great show on the ground when they fall. Varieties of Apples having deep, open 'cyes,' and large dried tufts of the calyces remaining in them, like the Codlin, the King Pippin, the Blenheim Orange, Margil, and Cox's Orange Pippin, are more liable to be infested than varieties like the Golden Knob, Russet, Nonpareil, and others, the 'eyes' of which are more closed up.

This attack is not always recognised as being due to insect agency. It frequently happens that an unusual fall of Apples is said to be the 'summer drop,' attributable to want of vigonr in the tree, or to the weather. No trouble is taken to examine the dropped fruit, and the caterpillars escape from it in due time, and conceal themselves, in order to pupate and produce moths for another year's attack. When

infested fruit is taken into store-rooms, the caterpillars creep out, and get into chinks and crannies in the walls and floors, from which the moths come forth, and fly to the nearest Apple-trees in the following spring.

The Codlin-moth is very troublesome in France, Germany, America, Canada, Australia, and Tasmania. In the last-named country it is so destructive that the Legislature has passed an Act for its repression.

DESCRIPTION AND LIFE-HISTORY.

The moth (fig. 4) is not quite three-fourths of an inch across the wings, and is about the third of an inch in length of body. The fore-wings are grey, with many wavy lines of a darker huc. At their extremities there are oval patches of a deep golden

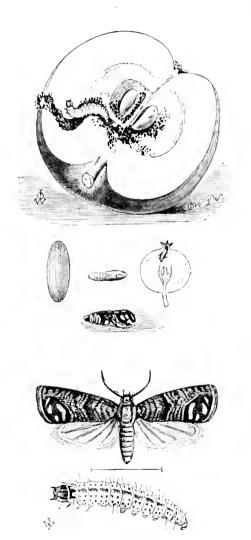

Fig. 4.—THE CODERN MOTH (CARPOCAFSA POMONELLA).

colour, by which this moth can be easily identified Its hinder wings are darker, having a golden tinge, and a lustrous shimmer. When the moth is at rest during the day it is an insignificant object, sitting on the trunks and branches of Apple trees, or on railings, fences, and hedges, with its wings folded in the form of a roof over its body. It appears about the end of May, and flies from place to place and from tree to tree in the twilight and at the dawn of day, and places an egg in or close to the calyces of the Apples, in the 'eye' of the fruit, where the skin is tender, and where it will be protected from the weather and other disturbing influences by the persistent calyces. The moth lays from 50 to 150 eggs. Only one egg is put on each Apple. After a period of from seven to nine days, a tiny caterpillar creeps out and bores into the Apple. It is greyish-white in colour, with a

black head, three pairs of claw-feet, four pairs of sucker-feet in the middle of the body, and a pair at the end. When full-grown it is nearly three-quarters of an inch long, and shortly before it pupates its cofour becomes slightly pink. From three weeks to a month is about the average duration of the active caterpillar stage. The caterpillar, having entered the Apple at the 'eye,' follows the core down to the pips, upon which it feels, pushing back in its progress morsels of core, pulp, and excrement.

At the end of about three weeks the caterpillar is full grown; having by this time eaten the greater part of the pips, it bites a hole from the centre to the outside of the Apple, through which it makes its exit. If the Apple is on the ground it merely crawls away. Should the Apple be still upon the tree, the eaterpillar lets itself down to the ground by a silken thread. When it has left the Apple it wriggles to the nearest tree and ascends it, constructing a kind of nest with little bits of bark knit together with silk. or composed of silk alone, or it simply gets into a convenient crack or crevice in the bark, and surrounds itself with a silk ease, gummed over with a sticky fluid. Sometimes it conceals itself in eracks in posts and fences, or under the bark of other trees, and even under rubbish and dead leaves, and pieces of branches and twigs near the trees. The nest is oval, and about the sixteenth of an inch in height. When the cater pillar is taken into the Apple-store or Apple-house in the Apples, it comes from them in due time, and hides in the walls or in cracks in the floor.

The caterpillar does not pupate until the first approach of spring, when it spins a cocoon, and becomes a brown chrysalis.

METHODS OF PREVENTION AND REMEMES

In order to prevent the caterpillars from crawling up the Apple-trees, old oil-cake bags or manure-bags should be tied tightly round the stems close to the ground early in the summer. This is practised to a large extent in America, Canada, and Tasnania. It is made compulsory by law in the last-named country, as well as in California, that Apple-trees should be treated in this way in May. These traps must be examined from time to time throughout the summer, and the caterpillars in the folds of the bags destroyed. It is better to have two bands of old bags, one a foct or so above the other, so that any caterpillars getting past the first band may be stopped by the other.

Windfalls' or 'drops' must be cleared away as soon as possible, especially if there are any signs of caterpillars in them. These should be disposed of at once, or, if not fit for sale, given to the pigs. In orchards sheep are useful, as they generally cut the drops' as fast as they fall. Where cider is made, the ground where Apples have lain in heaps should be well gas-limed and dng deeply. The walls of Apple-rooms and stores where the Apples have appeared to be infested should be well lime-washed in the early spring. The floors, also, and shelves should be well scrubbed with soft soap.

Scraping the bark from infested trees is adopted in America. A cloth is spread round the tree to catch the pieces of bark, which are burnt.

After this, hot lime-wash should be well brushed in, or the trunk may be sprayed with parattin and soft soap solutions.

American Apple growers spray the Apple trees directly the Apples are formed with Paris Green and London Purple solutions, mixed at the rate of 1 lb. to 180 to 200 gallons of water; or with paraffin or pertroleum emulsion, consisting of 1 part of oil to 14 parts of water, and sufficient soft-scap to make it of a proper consistency. This latter solution appears to be more suitable for this country, as there is an objection to applying poisonous compounds to fruit that is formed, and the smell of the oil would be more effective in preventing the moths from laying eggs.

In plantatious where the land is cultivated, quieklime or gas-lime, or lime and soot, in the proportion of one bushel of soot to two of lime, should be dug in round the trees. Where the Apple-trees are or grass-land, the grass should be cut short, the ground well raked, and the grass and rubbish burnt

TREES AND SHRUBS.

CYTISUS FRIVALDSKYANUS.

This, the latest addition to the cultivated species of Cytisus, is now grown in a few nurseries at and on the Continent under the name of Cytisus schipkaensis. A plant of it has for some weeks past been in flower in the Arboretum nursery at Kew, and although it does not possess the attractions of many of the old and well-known species of Broom, it is quite distinct, and for certain purposes well worth cultivating. It is a dwarf shrub of somewhat spreading habit, some of the branches being almost prostrate. The leaves are trifoliolate, the sharply-pointed, oblanceolate leaflets being almost glabrous on the upper surface, and thickly clothed beneath with appressed hairs. The petioles, too, are distinctly hairy, and the stems less so. Judging by the inflorescence, this species appears to be allied to C. capitatus, for, like it, the flowers are borne in a terminal umbel. The corolla is yellowish-white, but does not open so fully as it might were it not for the large hairy calyx, which clasps it for the greater part of its length. This defect may possibly disappear as the plants get older and acquire greater vigour. The species appears to be well adapted for growing in the mass, and will probably be of value used as we use several other dwarf Brooms (like Genista pilosa, G sagittalis, &c.), as a sort of carpeting to groups and beds of taller, more sparse-habited shrubs. It is a native of the Balkans, and was, I believe, found on the Shipka Pass, hence the name by which it has become known, but which Mr. Nicholson says must give way to the older one that heads this note. W. J. B.

SCOTLAND.

COMMON-SENSE TEACHING OF BOTANY.

UNDER the auspices of the Aberdeen Secondary Teachers' Association, Professor Patrick Geddes, of University College, Dundee, gave, on Saturday, the 13th ult., an outdoor demonstration of commonsense botany for children. The demonstration took place at Muchalls, a pretty little fishing village on the Kincardineshire coast, some 10 miles from Aberdeen. The afternoon was, of course, spent on the rocks, and Professor Geddes succeeded in showing how a botany class can be keenly interested, while at the same time its members are receiving a maximum of scientific information. His method is not to use the outdoor excursion as an aid to the text-book, but to use the text-book as an aid to the outdoor excursion. The pupil is encouraged to observe nature as he finds it; questions as to the reason of all phenomena brought under notice are inevitable, and the answer brings to light and impresses on the mind the ground principles of the science. Professor Geddes is full of enthusiasm for the work. At his bidding the large company wandered over the rocks for several hours, listening to, and guessing at, the reason of numerous natural appearances, with the result that they became so engrossed in the subject that time was not left to finish the whole of the afternoon's programme. The company took tea in Muchalls Hotel, Professor Pirie, of Aberdeen University, presided, and Herr Hein conveyed the thanks of the branch to Professor Geddes for the charming afternoon he had enabled them to spend. The party returned to Aberdeen in the evening, highly delighted with the excursion.

FRUIT AND FLOWERING TREES.

I have recently visited several extensive gardens in different parts of Scotland, and this is the result of my observations: that while the Apples, which had the benefit of the recent providential rains, promise both here and elsewhere to bear abundant crops, other fruits, especially the Cherries and Pears, have suffered much. In my own garden, perhaps the only exception is the May Duke Cherry, which had the advantage of blossoming somewhat later than such varieties as Werder's Early Black, the Early Rivers, and the Black Eagle, which either take a long time to establish, or when grown as pyramids are not very reliable. These have not in any case been tenacious of their fruit, though perhaps this fact is largely attributable, as I have indicated, to adverse atmospheric influences. Their example has been followed by the Pitmaston Duchess and Doyenné du Comice Pears, which, while exhibiting towards the end of April a marvellous wealth of blossom, are almost destitute of fruit. The Early Crawford Pear, which Dr. Hogg thinks greatly superior to the Prench Citron des Carmes, and which is grown very exten-

sively in Scotland, is somewhat more successful, but it has been longer established than several of its con-temporaries of greater reputation. The Apples, temperaries of greater reputation. the however, are splendidly premising, and that is, under the circumstances, an abiding consolation. The Plum-trees have also magnificent crops, especially the Czar, the Early Rivers, and Dennisten's superb Green Gage, though their foliage, having been in many instances affected injuriously by the long-continued drought, is almost insufficient, unless on sheltered walls, to fulfil the wise purpose for which it is intended-that of protecting the frmit during the period of growth from the somewhat exacting radiance of the sun. An Almoud-tree, 13 feet high, transplanted from a Hertfordshire nursery to my garden in the end of March, has already developed fruit as large as an ordinary-sized Damson, but having been sent with wet soil placed around the roots, it suffered no retrogression. In any case, it has not taken long to get into perfect correspondence with its environments, and its gratifying success seems clearly to indicate that Amygdalus communis, as the variety I possess is betanically named, will not only flower luxuriantly in the south of Scotland, but also successfully develop its fruit.

I have recently had Magnelia Watsoni in bloom. The flowers are very large, of a beautiful creamy-

I have recently had Magnolia Watsoni in bloom. The flowers are very large, of a beautiful creamy-white complexion, and exceedingly fragrant. This variety would be worth growing if only for the sake of its foliage, which is highly artistic. Does Magnolia Watsoni flower much in England! I never see it mentioned in the horticultural journals, while there are occasional descriptions of the floral impressiveness of other varieties, such as M. couspicua and M. grandiflora, which, notwithstanding the multitude of flowers which they produce, are less commanding in effect. David R. Williamson.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

GENERAL WORK.—In districts where but little rain has fallen, it may be necessary to well water those parts of the lawn which have become browned by the recent drought, especially narrow verges of grass, or those parts on the lawn where the turf was re-laid during the past season. Grass-lawns should not be mown too closely, until signs of quick growth takes place. Gravel-paths and roads should be well watered and rolled where the materials have become loose, and attention given in keeping them free from weeds.

FLOWER-BEDS, ETC.—If the surfaces have been caked by frequent waterings, lightly stir them with a hoe. Beds filled with Begonias should be slightly shaded during the hottest part of the day until the plants are established, as the foliage is liable to blister. Aloysia citriodora is already showing signs of the drought, and is being attacked by redspider, to which it is very susceptible. The plants should be well syringed with an insecticide, and afterwards receive a good drenching of water. Garden-vases and window-boxes require to be kept in the best possible order, and all decaying foliage and flower-stems must be promptly removed. Where the boxes or vases have become full of roots, give a good dressing of artificial manure.

STOCKS. — Sowings of the perennial varieties should now be made, in order to have plants in good condition to stand the winter. The seed should be sown either broadcast or in shallow drills, on a well-drained border. A damp or too rich a soil must be avoided, and every care taken to ensure a hardy growth before winter commences, unless the plants can be wintered in cold frames or pits. As soones the seellings are large enough to handle, transplant them, and give each plenty of room for making growth. At the end of September or beginning of October, if the plants appear to be making too succulent a growth, a check should be given by lifting them with a trowel and again replacing them.

SWEET WILLIAMS.—These are now at their best, and by some are esteemed great favourites. A sowing of seeds may now be made, it being advisable to sow annually, if a good supply of young plants is to be kept up. Sow in the open border, and when the seedlings are large enough to handle transplant them about 6 inches apart each way. They may then remain undisturbed until the following spring, and then be removed to their permanent quarters early in the season. A packet of seed will produce a multitude of colours, but the auricula-eyed and Sutton's

Harlequin are amongst some of the best varieties that can be grown.

CANTERBURY BELLS.—A large bed of these, now in flower, reminds one that attention to those plants already raised this season will be necessary, if a similar display is desired next season. Seedlings already pricked off into hoxes or pans should be potted into 3-inch pots, and grown on in a cold frame for another month or six weeks, when they should be planted out in their permanent quarters; the soil in which they are finally planted out should not be too rich, it being preferable to give them a mulching of manure during the early spring.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

RASPBERRIES.—Remove all suckers from between the rows of canes, and examine the young growths; if more of these were left at the first thinning than will be required, reduce them further by removing the weakest. Run a piece of tar cord along each side of the rows to support the young canes, and to prevent their being damaged during the gathering of the fruit. As the fruit commences to ripen, nets should be placed over the area, and supported by string or wire at a sufficient height above the fruiting-canes, that the fruit may be conveniently picked without removing the nets.

RED AND WHITE CURRANTS. — Remove the points of the leading shoots upon these bushes, and prune the side-growths back to about 2 inches. These will also require protection from birds, and if the trees are planted in rows, a good plan is to fix a thin lath over the centre of the rows to keep the nets from damaging the top of the trees. Where the fruit on a few special trees is required to be kept for a longer period, pieces of wire-netting, 4 feet high, I inch mesh, placed round each tree, keeping it just clear of the fruit, and covering over the top with a small piece of fish-netting, will keep it quite secure from birds as long as it will hang on the trees. Black Currants will not require any pruning at this season, but the fruit must be protected, as advised for the red and white varieties.

GENERAL WORK.—The foliage of Pears and Cherries was severely attacked last summer with the larve of the sawfly, Selandria atra, but perhaps more generally known under the name of the slugworm, being easily recognised by its black, slimy appearance. By frequently examining the trees its presence may soon be ascertained, and remedies must then be applied for its destruction. Fresh-slacked lime, finely sifted, and dusted evenly over the foliage, will invariably check its career, but a second application may be necessary. Cherry trees so attacked which are carrying a crop of fruit, should have the lime well washed off with clean water directly afterwards. All early varieties of Apples and Pears, not finally thinned should be attended to at once. These early sorts, being naturally small fruited, if not well thinned, a great part of the crop will be useless either for dessert or kitchen purposes, besides which such a crop will materially weaken the trees.

THE ORCHID HOUSES.

By W. H. White, Orchid Grower, Burford, Dorking.

CYPRIPEDIUMS.—The dwarf-growing C. niveum, C. concolor. C. bellatulum, and C. Godefroyæ are types from which several beautiful and valuable hybrids have originated. All of them luxuriate in a warm, moist stove or East ludian-house, where fresh air may circulate freely around them; they require but little shade at any time. They should be planted in pots or shallow pans, in a compost consisting of good turfy loam and fibrous peat, intermixed with lumps of sandstone or limestone-rock. Tufa-rock, in many cases, produces very satisfactory results. These plants grow naturally on rocks, and the conditions existing in Nature should be repeated as far as practicable. Their flowering season is now past, and the present is a good time to repot them. It is very essential that the fresh material be made thoroughly firm about the roots, as these have a decided tendency to cling and ramble among hard substances. All of the above species require plenty of water during the summer months, but in winter it should be applied very carefully, as the thick fleshy leaves are inclined to become spotted and diseased if over-dosed with moisture. Instead of watering them in the usual way with a can, it is preferable to stand them in a pail of water, just covering the rim of the pot, and allowing them to remain for several minutes, to ensure a thorough soaking; thus water will be prevented from lodging in the growths or axils of the

leaves. Thrips are exceedingly fond of the young foliage, and must be sought after frequently. It is always necessary to caution beginners in Orehid culture when sponging the leaves not to raise them more than is really necessary, or they will crack and cause great disfigurement to the plants.

CALANTHES.—The decidnous Calanthes of the Veitchii and vestita section are now growing vigorously, and well-rooted plants will require abundance of water at the roots; but more care will be necessary as regards those plants that are not yet well-established, or disease will result. It is a good plan to look over the plants occasionally, and place together all those that have filled their pots with roots, so that they may be treated to alternate waterings of weak liquid cow-manure. This will conduce to the formation of stout bulbs and strong flower-spikes. Previous to using the manure-water, it should be strained through a very fine sieve or piece of muslin, so as to remove all particles of solid matter, which, if not separated from the liquid, would, after a few applications, stop up the pores of the compost. Do not allow the stimulant to be too strong at first; about one part to three parts of water will be sufficient for the first few waterings, afterwards increasing it to about one-half of each. At this time many young roots will appear on the surface of the compost, and if a thin layer of lumpy fibrous loam be placed lightly over them, they will quickly root into it, and the strength of the growths will be increased. Keep the plants as near to the roof-glass as convenient.

PLATYCLINIS (DENDROCHILUM) GLUMACEA.—Now that growth is completed, it is advisable to remove this plant to the Cattleya or intermediate-house, and to afford less water to the roots. The plant will be greatly benefited by a long season of rest. An occasional syringing and sponging of the leaves will help to keep them free from red-spider. P. filiformis is now in full growth and showing its flower-spikes, and will require liberal treatment in every respect.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

MELONS.—There should be no delay in getting all the Melon plants that are to provide the late supplies planted, a moist, genial top-heat, and a bottom-heat of about 90° being afforded, so that the plants may start away quickly and strongly. Attend to the stopping, thinning, and tying of the shoots; syringe the foliage on bright days, except at such times as the fruit is being set, or when it is getting ripe, at which times a drier air should be maintained in the Melon-house or frames. Plants which have just finished off a crop of fruit may be retained for fruiting again if the foliage is healthy, and there is no disease of the stem. It is an advantage to fruit these plants, as ripe fruit can be obtained early from them, and the flavour is generally superior to those from fresh plants. The foliage where decayed should be removed, and lateral growths encouraged; the surface soil should be loosened, and a part of it removed, a top-dressing of fresh loam being then applied, and the whole soaked with tepid water. When the new shoots have started, liquid-manure may be freely given, and the plant treated as usual.

CUCUMBERS.—Seeds should be sown now for furnishing plants to supply Cucumbers during the autumn months. Attend well to plants now in full bearing, thinning-out exhausted growths and laying-in young bearing wood: top-dress the soil frequently with fresh, lumpy loam, and give abundant supplies of liquid-manure, varying this kind of stimulation by occasionally top-dressing with Clay's or Thomson's fertiliser.

MANURE.—Young plants coming into bearing must not be checked in growth by being too heavily cropped, or it will be difficult to keep up a continuous supply of fruits. The Melon, when it is sufficiently ripe, should not be allowed to remain on the bine, but should be cut with a piece of the stem attached, and stored in a cool place, with the end of the stem immersed in a vessel of water; with this kind of treatment Melons keep in good condition for several days.

STRAWBERRIES FOR FORCING.—The present time should be utilised in securing early and strong runners for next season's forcing. The runners found on young plants are usually the best, and the layering should be performed before the rootlets have taken hold of the soil. With proper attention in the matter of watering, the roots will soon fill the pots; the plants may then be detached from the parents, and placed in a shady place for a few days preparatory to re-potting them into

fruiting-pots of 5 inches in diameter for early varieties, 6 and 7 inches for late ones. Quite new well-drained pots should be used, and the potting firmly done with a potting-stick, care being taken not to bury the crowns in the compost, but to leave them level with the surface. Stand the plants on a bed of einders in an open sunny situation, with sufficient space between each plant to allow of the circulation of the air amongst them. Sprinkle the foliage for a few days till established, keeping them well supplied with water after fresh roots are made, and removing runners as they appear.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gardener, Woodside, Durlington.

celosias. — Pot-bound plants may be afferded a shift into larger pots previous to removing the plants to the conservatory or greenhouse. Celosias are the better for being grown in comparatively small pots, and 32's are sufficiently large for general purposes, as pots of smaller size scarcely afford enough nourishment for the plants, and the foliage then suffers.

TUBEROUS BEGONIAS.—If the plants have been raised from seed, select those that have the finest flowers for pot-culture, using the remainder for bedding-out purposes, and as all will now be more or less coming into flower, there will be no difficulty in making the selection. A final shift may be afforded those plants which are to be grown in flower-pots, the size of the pots being determined by the size the plants are intended to become. I seldom afford a larger shift than a 7-ineh pot, and the bulk of my plants are cultivated in 5 to 6-inch pots.

PELARGONIUMS being among the principal flower ing plants for the summer season, will require close attention and the application of liquid-manure all through the flowering season, and if farmyard or stable-drainage may not be used on account of the stench arising from it, Peruvian guano may be used instead, putting just enough into the can to colour the water slightly at each watering. By this means zonal Pelargoniums may be kept gay for a long time. Immediately the petals of a flower fall, the seed-vessel or ovary should be nipped off. This caution also holds good for Fuchsias and other plants. Specimen Pelargoniums for exhibition now at or near their best, will require a cool, span-roofed, airy house, so as to induce the production of flowers equally all over them, whereas in lean-to houses they incline to take a one-sided form unless the plants are frequently turned round. The watering of these plants must be carefully done, never allowing a plant to get dry at the root—in fact, an examination is required several times daily. As a stimulus to growth, sheep's manure used as a liquid is one of the best, and it may be afforded at each alternate watering.

FUCHSIAS, if they are wanted to flower throughout the summer, should now have filled their pots with roots, and will need abundance of water. Three times a week farm-yard liquid or guano-water should be afforded such plants, and they should not be permitted to become dry at the roots, or flowering will cease at once. The latest batch of Fuchsias should receive their final shift at about this date, the pots made use of being of 8, 9, and 10-inches according to the size of the plants. Put a generous addition of Thomson's Vine or other enduring kind of manure with the soil, and give the shoots their last stopping. The Fuchsia always does best if grown in a house that is kept rather close, and free from draughts.

THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Dropmore, Maidenhead.

TURNIPS.—I usually make a good sowing of Turnips at this time on a piece of land that is cleared of the early Cauliflowers, in the open quarters of the carden. The ground should be deeply hoed with a draw-hoe, and a good sprinkling of soot and wood-ashes applied, which must be well worked in with a wooden rake, and at the same time all rubbish raked off. Sow the seeds in shallow drills at 12 to 15 inches apart, and if very dry, water these before sowing. The yellow-fleshed variety, "All the Year Round," is a capital one to stand throughout the winter; it takes rather longer than most Turnips to attain a usable size, but the present will be found a suitable time to sow a good breadth for winter use. Veitch's Red Globe, Snowball, or similar varieties may be sown now for autumn use.

EARLY CELERY.—The plants which were put out earliest will require to be cleared of weeds, and any suckers or partially-decayed leaves should be

removed. The surface soil in the trenches may also be slightly stirred between the plants. If a little finely-broken-up old Mushroom-bed manure can be spared, this will be found an excellent mulch to spread over the trench an inch or so deep, and earthing-up may be deferred until a stronger growth has been made. Water must be applied copiously in the event of the continuance of dry weather. The foliage should be carefully watched for evidence of the Celeryfly, and the portions containing the maggot should be picked off and burnt. Dressings with insecticides are uscless, but further attacks of the fly may be partially ehecked if the tops are occasionally sprinkled slightly with soot when the leaves are damp with dew.

BORECOLE.—Advantage must be taken of any dull or showery days for planting out Berecole in quantity. Although little rain has fallen in this district since the 10th ult., advantage has been taken of several partially dull days to get good breadths planted of curled and other Kales, autumn Broccoli, and Savoys. Before drawing the plants from the nursery or seed-beds, a good watering should be given to thoroughly moisten the soil. Prills should be drawn out previously, at 2 feet or more apart, according to the variety; planting may also be done among short-topped early Potatos, where the rows are 30 inches apart. One good watering, at least, will be necessary to settle the soil well around the roots.

OUTDOOR TOMATOS. — These have generally made a good start, and where planted against walls or fences may now be nailed in position, time having been allowed for any slight settlement since planting. A stout 6-feet stake should also be placed to each of those growing in the open border, and the main stem be tied upright to them. Keep all side-growths pinched out from these and others on walls, the most satisfactory practice being to train them in the shape of a simple upright cordon.

THE APIARY.

By EXPERT.

SWARMING AND THE STORING OF HONEY.—Having completed a ten days' tour for a County Council in the south of England, I was surprised to find in a good many instances that the bees had swarmed, and left crates of half-filled sections, which means in a great many districts that only one crate of sections will be properly filled instead of two, and, in some places three. This might have been avoided by taking proper care to prevent swarming; and this could have been done in most cases by giving more room, and allowing extra ventilation and cutting out queen cells. If the bees persist in swarming after these precautions have been taken, the queen should be taken from them and returned to the parent stock, as the honey season is drawing to a close, and the bees having very little to collect from, excepting the flowers of the Lime which are just coming into full bloom: they should be kept at work while there is the least chance of honey gathering.

SECTIONS will not be so plentiful this year, as numerous bee-keepers have gone in for extracted honey, because they find in many places there is a better sale for run-honey, so that those who are fortunate enough to have a good number of well-filled sections should be able to command a good price for them, if they are not placed on the market too quickly, which is a great mistake, particularly in a district where a lot of bees are kept. A word about using super-clearers: be careful that the spring in the clearer works properly, otherwise the bees cannot escape; and see it is not propolised. Should this be the case, place it in a little hot water for a few moments, which will soon take away any sticky substance that may be adhering to it. The present is a good time for those who wish to increase their stocks to look around and get the promise of bees from the cottagers, who would sooner have them—a very cruel practice, when one takes into consideration the hard work the bees have done.

FOUL BROOD.—Take care in increasing your stock that no disease of this nature exists, and always take the precaution of keeping a little napthaline in the hives; and should you notice any disease in the combs, destroy the hees—it is not worth the risk to keep them, particularly if you have a large number of hives.

SECTIONS THE RIGHT WAY UP.—On taking off sections and storing away, be careful to keep the section the same way up as they were taken from the crate, otherwise the honey will frequently run out, and a few leaky sections will spoil a good number of others, and this loss may be avoided by taking care.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letlers for Publication, as well as specimens and plants for maming, should be addressed to the EDITOR. 41, Wellington Street, Covent Garden, London. Communications should be written on one sine only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but hapt as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

**Dustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these rags, of gardens, or of remarkable plants, flowers, trees, &s.; but he cannot be responsible for loss or injury.

4-3cal News.—Correspondents will greatly oblige by sending to for Editor early intelligence of local events likely to be of interest to our readers, or of ony matters which it is desirable to being under the notice of horticulturists.

Etewspapers.—Correspondents sending newspapers should be sireful to mark the paragraphs they wish the Editor to see.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -63° 2.

THE Department of Agriculture Agricultural has recently issued its Year-Book under the title of Agriculsural Returns for Great Britain. In this are shown the acreage and produce of crops, price of corn, and number of live-stock, and other agricultural statistics for the United Kingdom, British Possessions, and foreign countries for 1895. Very much of the contents of this volume has already appeared in the Trade and Navigation Returns, issued each month by the Board of Trade, and noticed by us on each occasion in a very abbreviated but withal comprehensive form. There is an enormous mass of figures within the covers of the book, which will be found of great interest to agriculturists in view of the heavy competition to which the industry is subjected from almost every quarter of the globe. Outside of all this interesting snatter there are some itoms which concern the readers of this journal, and one of the first in the volume refers to the acreage of orchards and market gardens respectively as returned on the ath of June in the year 1895 and 1894, in each

county of Great Britain, &c., of which the following table gives a sufficient outline:—

Country.	Orch	ards.	Market Gardens.		
	1895.	1894.	1895.	1894.	
	Acres.	Acres.	Acres.	Acres.	
England	. 212,963	208,821	85,398	81,057	
Wales	3,564	3,509	1,395	1,367	
Scotland	. 1,901	1,857	6,044	5,786	
Great Britain	. 218,428	214,187	92,837	88,210	
Isle of Man	. 79	35	208	190	
Jersey	. 1,020	981	97	103	
Guernsey, &c	. 237	258	50	85	

The following summary is solf explanatory:
Acreage of Woods and Plantations, and of Nursery Grounds.

Country.			Woods and Planta- tions.	Nursery Grounds	
			Acres.	Acres.	
England	***		1,665,741	11,634	
Wales			151,610	264	
Scotland			875,765	1,392	
Total Erit		reat	2,726,116	13,290	

Concerning Potatos, there has been an extension of 7 per cent, in the acreage under this crop, bringing the total up to 541,000 acres. The report says, it is not without interest to observe, in the light of the low values ultimately realised for the product of this crop, that (according to the collectors' reports) alike in Kent, Cambridge, Bedford, and Lincoln, as well as in Cheshire and the West Riding of Yorkshire, the larger area planted in 1895 was ascribed mainly to the good prices that had been realised for the preceding crop. The extension of 1895 was, however, no doubt, in part at least, a recovery from the unusually small area planted in 1894.

Respecting Hops and small fruits, the area under the former last year was 59,000, a slight reduction of one per cent., and this in Kent. The cultivation of small fruits appears to be extending in Great Britain, the 68,400 acres of 1894 having become 74,500 in 1895. The figure now reached is more than double that recorded in 1888. Kent still devotes the largest area to small fruits, returning no fewer than 22,000 acres, or nearly one-third of the total, Middlesex and Worcestershire follow in size of area, but in these counties only between 3,000 and 4000 acres of small fruits have as yet been returned.

There has been a lament through the great diminution of the acreage in Wheat, but Barley, Oats, and various other crops are extending their areas, and small fruits evince a tendency to bulk more largely in the agricultural yearly balance-sheet. A much better system of gathering and distributing the produce generally is sadly wanted. County Societies, and District and Parish Councils should endeavour to secure a better share of profits for the producer than he now obtains.

Nepenthes.

M. Jules Rudolph has lately issued a cultural monograph on the species of Nepenthes. It has been premiated by the National Horticultural Society of France, and is now published separately by M. Octave Doin. A list of the species and hybrids is given, with details as to their culture, details which are likely to be very serviceable to cultivators. A few slips may, however, be pointed out; for instance, Mr. Dominy was never connected with Glasneyin, and, of course.

never raised any hybrid Nepenthes there. No mention is made, so far as we see, of Sir Joseph Hooker's finely illustrated monograph of the genus in the *Transactions of the Linnean Society;* nor of Mr. Burbidge's remarks on this genus, nor on the species collected by him in Borneo.

M. Rudolph alludes to a curious degeneration of the hybrid N. Mastersianus ×, which we have not heard of in this country. The plant is propagated by cuttings or by layers, and is, according to M. Rudolph, so subject to degeneration, that only those who are the fortunate possessors of plants raised from the original seed can rely on the perpetuation of the special characters of the plant in all their beauty. This is an extraordinary statement, and quite contrary to the usual experience of gardeners with other plants. One does not see why Nepenthes should prove any exception to the rule. In any case, further evidence is required before we can accept such a statement as established.

As to the digestive power of the juices of Nepenthes, it is known that Professor VINES many years ago extracted a peptic ferment from Nepenthes. The fact confirmed by GORUP-BESANEZ, and others, has been disputed by DUCHARTRE and RAPHAEL, who attributed the dissolution of the nitrogenous matters introduced into the pitcher to the putrefactive action of bacteria. If so, of what use can the complicated arrangement of traps and secreting glands be?

From this point of view it is interesting to cite what Professor VINES says in the current number of the Annals of Botany, a publication just issued, and which therefore Mr. Rudolph cannot have seen. Professor VINES there says (p. 292) that he has repeated the experiments he made in 1876; and "that, so far as the work has been carried out at present, the results completely accord with those at which I arrived twenty years ago."

RHODODENDRON SMIRNOWII. - This is undoubtedly one of the most interesting species of Rhododendron which has been added to our collections of these plants in recent years (see fig. 5). It is a native of the Caucasus, and seeds of it were sent to Kew from the St. Petersburg Botanic Garden in 1886. The plants thus obtained flowered for the first time in May, 1893, and have flowered with increasing freedom each year since. The species is in many respects quite distinct from any other Rhododendron in cultivation, except its near ally and neighbour, R. Ungerni, which was found at the same time. Considering the size of the leaves, flowers, and inflorescence, it is remarkable for its dwarfness. Some of the plants at Kew, although ten years old, are still only 6 or 8 inches high, and not one is more than 18 inches in height. There are, of course, plenty of species of Rhododendron which at that or even greater age would be no taller than these, but none, so far as we know, producing trusses that in size and beauty compare favourably with many named garden varieties. This character suggests the possibility of obtaining by hybridisation a new breed of Rhododendrons of a more dwarf and compact habit than any of the garden varieties, and yet equalling them in the beauty of the flowers. Several crosses have, as we learn, been made at Kew between R. Smirnowii (as the seed-bearer) and the finer garden varieties, and some distinct-looking young plants have been obtained. The leaves of R. Smirnowi are narrowoblong or obovate, blunt at the apex, the largest being 5 iuches long by 2 inches wide. When young the lower surface is covered with a white, felt-like covering which with age becomes pale brown. The upper side, too, is covered with a similar substance, but it is easily rubbed off, and the surface soon becomes glabrous. The lcaf resembles more closely that of

the Himalayan R. niveum than any other in cultivation. The flowers are borne in large, rounded trusses, the corolla being of a bright, rosy purple, and from 2 to 3 inches in diameter. The species is perfectly hardy. Our illustration is from a plant that flowered at Kew.

ROYAL HORTICULTURAL SOCIETY.—A special meeting of the Fruit and Vegetable Committee was

three marks, the lack of the full quorum of eleven members preventing the awarding of Merit Certificates; Sutton's Prizewinner, a very fine dwarf Marrow, and Fureka, 3 feet, having good sugary flavour; also Carter's Michaelmas, 3½ feet, a capital late variety, and excellent cropper. Hero of Trowbridge, 4 feet, good. Boston Unequalled (Johnson), a very fine 3½ feet variety. Lord Granby, of medium height; Ne Plus

these, three marks were awarded to Jersey Lily (excellent for summer growth), Veitch's Red Globe, Sutton's Early Snowball, Cattell's Silver Ball, the Flat Forcing, and Green-top Stone. It was desired that seeds of all the later or winter varieties be shown again in August. Also that the Early Long-pointed be recommended at the next Drill Hall meeting for an Award of Merit.

Fig. 5.—Rhododendron smirnowii: flowers rost-purple, leaves downy on the under surface. (see f. 14.)

held in the Chiswick Gardens, on June 29. Present: Mr. J. WRIGHT, chairman; the Rev. W. WILKS, Secretary; Messrs, Balderson, J. Smith, J. Willard, W. Farr, A. Dean, G. Sage, J. R. Laing, and G. T. Miles. A large number of mid-season and late Peas, Secretally in excellent condition, were seen. These included some older varieties for comparison of newer enes. The following were selected for the award of

Ultra, Lord Mayor, 5 feet high, having superior quality. The Gladstone, 3 feet, carrying long curved handsome and well-filled pods; and Vilmorin's Tall Butter-Sugar Pea, a free cropper, pods of the ordinary size of shelling Peas. Pods of this latter were cooked whole and pronounced excellent.

Turnips next claimed attention, the later sorts of a very extensive collection being now mostly ready. Of

THE ROYAL GARDENERS' ORPHAN FUND.—The monthly meeting of the executive committee was held on the 26th nlt. at the Horticultural Club, Hotel Windsor, W. MARSHALL, Esq., presiding. A letter was read from Mr. ROBERT TAIT of Manchester, announcing that an entertainment proposed to have been given by the Manchester Gardeners' Association on behalf of the Fund had been abandoned

consequent upon the death of Mr. Bruce Findlar, but stating that a sum of £50 would be forwarded in lieu thereof. A report of the annual dinner was made by the Secretary, Mr. A. F. Barron, who further announced that the subscription-list was expected to reach a sum of £900. Orders were given for the payment of the quarter's allowances to children, amounting to £217 11s., and to discharge other accounts. The usual vote of thanks was passed to the chairman for presiding.

THE NATIONAL PINK SOCIETY (MIDLAND SECTION).—Mr. C. F. THURSTAN, the Hon. Sec. of this Society, has just issued an intimation to the effect that no exhibition will be held this season in connection with the Wolverhampton Floral Fête on July 7, owing to the bloom being over, as a consequence of the warm, dry spring. For a few years past, Pinks have formed a part of the diversified display made at Wolverhampton on the occasion of the July exhibition, and many will regret the absence of this fragrant flower for the reason above stated. The Pinks were in flower in the South much earlier than usual, and at a time when it was very hot and dry, censequently the duration of the bloom was a very short one.

A FARM-SCHOOL FOR BEDFORDSHIRE.—On Tuesday morning the Bedfordshire County Council accepted the invitation of the Duke of BEDFORD to inspect his experimental fruit-farm, and also the farmschool which the County Council, by his Grace's liberality, has been enabled to establish at Ridgmount in that county. His Grace has placed at the disposal of the Technical Instruction Committee of the County Council a farm of 275 acres, 149 being arable land, and the rest grass; and also erected the necessary lecture-rooms, dormitories, and other buildings, for the accommodation of twenty boys, who are granted free scholarships by the County Council, entitling them to two years' board, residence, and instruction in the science and practice of farming at the school. The two principal officers are a house-master and farm manager, who hold high qualifications for their positions. Every branch of farm and garden practice is taught by precept and with models and specimens in the school, and by actual work on the farm, in the dairy, the poultryyard, the garden, and the farmstead generally. The premises are completely equipped with the newest implements, and well stocked, while various crops are cultivated. The proximity of the fruit farm and the Woburn experimental station also present opportunities of giving instruction. The boys are the sons of agricultural labourers or small farmers. Inaugural speeches were delivered on Tuesday, with Mr. H. Blundell (chairman of the instruction committee) presiding, supported by the County Council, and Mr. THEODORE HARRIS, who has taken a deep interest in the scheme. The institution is modelled on the lines of similar school-farms on the Continent, which were earefully inspected and reported upon by the organising secretary of technical instruction three years ago. The Duke of Bedford was heartily thanked for his generosity in assisting to establish an institution which is believed to be unique in this country. The Times, July 1.

SOCIETY OF ARTS.—The Council have awarded the Society's Silver Medal to the following correspondents of this journal who have read papers during the Session 1895-96. At the ordinary meetings:—To Dr. D. Morris, C.M.G., M.A., for his paper on "Bahamas Sisal Industry:" to Edward W. Badger, for his paper on "Fruit and Vegetable Drying:" to G. Scott Elliot, for his paper on "The Commercial Prospects of English East Africa and British Central Africa."

"A TRAVELLER'S NOTES," — Many of our readers will remember the series of letters from Mr. J. H. Veitch which appeared in our columns in 1891-94. They gave the details of a more widely extended and continuous tour than is furnished by the annals of horticulture. Mr. Veitch's object was specially horticultural; he desired to see the

conditions under which the plants cultivated here grow naturally, and he was anxious to visit all the gardens, public and private, scientific, or commercial, that came in his way. How faithfully he carried out his object, with what careful attention to detail he made his notes, his letters gave ample testimony. These notes have now been collected in the form of a handsome quarte volume, richly illustrated with photographic and other illustrations, many of them taken by the author. In this manner the general features of the vegetation and of the gardens of Ceylen, North-west India, Bengal, Malaya, Java, Hong-Kong, Canton, Japan, Corea, Queensland, West Australia, South Australia, Victoria, New South Wales, and New Zealand, are passed in review. The photogravures are excellent. A word of praise must be given to the printer for his share of the work. A route-map and a good index complete a work which is not only of present interest, but which will be of value for reference to future generations. The hook is for private circulation only.

INTERNATIONAL AGRICULTURAL CONGRESS, BUDA PEST.—A Congress will be held in Buda Pest from September 17 to 20, 1896, with the sole object of enquiring into the causes of the agricultural depression, and as to the means of remedying it. The discussions will be held in the three following categories:—I. Production: II. Commerce and Traffic; and III. Customs and Credit.

EDINBURGH SCHOOL OF RURAL ECONOMY. -A copy of the Syllabus of the Edinburgh School of Rural Economy for the Session 1896-97 has now reached us. These classes, which are under the care of an influential board of management, appointed jointly by the University of Edinburgh, the Highland and Agricultural Society, the Edinburgh Town Council, and the County Council of Mid-Lothian, have met with great success, and have been highly appreciated, over 200 students having attended them last year. The courses of instruction arranged for the Session 1896-97 are similar to those of last year. Their main features are :-- 1. A Two Years' Curriculum of Day Classes in Agriculture and allied sciences; 2. A Course of Day Lectures on Forestry in the University; 3. An extensive series of Evening Classes on Agriculture and allied sciences, embracing Horticulture and Forestry: and 4. The usual Summer Vacation Classes for Schoolmasters, which have been well attended. The day classes extend over two Sessions, each beginning in October and ending in March. It is expected that those entering for these classes will have previously completed a good general school training. The work of the First Session, embracing Mensuration, Mechanics, Elementary Physics and Chemistry, Botany, Book-keeping, Drawing, and Handicraft, practically completes the preliminary education of the student, and gives him an adequate knowledge of the elements of the sciences that have a direct bearing ou agriculture. At the same time his interest in the practical aspect of his work is maintained by such class exercises as those in measuring buildings and fields, in making drawings of these to scale, in woodwork, and in the application of physics in agriculture. The subjects of study in the second session are Agriculture; Agricultural Chemistry, Botany, Zoology, and Entomolgy: Veterinary Science and Forestry. The complete course thus aims at fitting a young man to enter with intelligence into his work as a farmer, a gardener, or a forester. It should enable him to understand the greater part of the work that he will see in practice, and to study for himself any special subject that he may afterwards find to be of importance to him. A student who has satisfactorily completed the two years' course of study, and who has had the required experience of practical work on the farm or in the forest, should find himself sufficiently prepared for the Examination for the Diploma of the Highland and Agricultural Society. Numerous and varied evening classes are provided for those who are otherwise engaged during the day. A specially moderate scale of fees has been arranged. This will be indicated by the fact that the inclusive fee for the first year's entire course in agriculture is five guineas. Copies of the Syllabus are to be had from the Secretary of the University Court, Edinburgh, or from the Secretary, 3, George IV. Bridge Edinburgh.

THE READING AND DISTRICT GARDENERS MUTUAL IMPROVEMENT ASSOCIATION .- A party of about one hundred members assembled on Thursday evening to inspect the trials of culinary Peas, Sweet Peas, Potatos, &c., at Messrs. Suttons' grounds. The party being a large one was divided, one portion going to view the culinary Peas first, the other to inspect the Sweet Pea trials. The trials of culiuary Peas is a very extensive one, and number 590 in 334 varieties. It being early in the season, only the first and second earlies were seen at their best. The Peas are cultivated under ordinary conditions; they had not been afforded any artificial watering, and old varieties are found growing alongside of the newest, thus affording an excellent opportunity for comparisons. Sutton's Seedling and Excelsior are large pedded, first early, wrinkled Peas; and the variety Bountiful, was spoken highly of for early supplies by those of the visitors who had grown it. Among late Peas, two or three of the Duke of Albany type, attracted attention. The Sweet Peas consisted of 125 trials, all represented by different names, and filled 350 rows of 16 feet in length.

PROPOSED BOTANICAL MUSEUM FOR ABER-DEEN .- The Aberdeen Burgh Committee, at its meeting on Friday afternoou, 26th ult., had under consideration a letter from Professor J. W. H. TRAIL, Aberdeen University, containing a proposal for the establishment of a museum as an aid to teachers who endeavour to give their pupils instruction in nature; knowledge such as it ought to be, and net merely from hooks, and from which the teachers could borrow. Such a museum could be formed for a comparatively very small sum. Dr. TRAIL intimated that he would gladly advise and assist, if the committee sanctioned the proposal to begin such a collection. Dr. TRAIL appended a list of the specimens required. In contending for his proposal at the meeting, Dr. TRAIL maintained that such an institution would give pupils intending to go to the University, a grounding which would be very useful. An informal discussion ensued, and although favourably viewed, the matter was

ACORUS CALAMUS .- This fragrant Aroid is not uncommou along the banks of the Thames and of the canals in certain parts of Middlesex, so that no suspicion of its not being truly a native is entertained by many. Parkinson, however, Theatre of Plants, p. 140, says:- These Reeds are strangers, not growing with us, we having no further knowledge of With reference to this plant, the following incident may be mentioned :-- Many years ago a Kentish farmer had occasion to consult a London physician. The doctor, amongst other things, prescribed some preparation of Acorus calamus. On the farmer asking how and where he could procure the drug, the physician said, "You go and ask Mr. Mof Canterbury, and he will tell you." The farmer did so; received precise indications as to where the plant might be found, when the farmer replied, "Why, the house you mention near the pool where the plant grows is the house wherein I live!"

"THE STURTEVANT PRELINNEAN LIBRARY OF THE MISSOURI BOTANICAL GARDEN."—This is a catalogue (reprinted in brochure form from the seventh Annual Report of the Missouri Botanical Garden) of such volumes, published previous to the year 1753, as were given to the garden by Dr. E. Lewis Sturtevant in 1892. The books are, of course, all devoted to botanical and horticultural subjects, and include an extraordinarily rich collection of herbals, natural histories, and medical botanics in many languages, the whole forming an interesting and valuable collection upon the acquisition of which the garden is to be congratulated.

"THE SOURCES OF PLANT-FOOD."—This little book contains a paper read hefore the Manchester Horticultural Improvement Society by E. GRIFFITUS HUGHES. The scope of it may be gathered from the sub-title, which mentions that the book includes "detailed analyses and experiments showing the dominant mineral elements which govern the growth of plants; and the development of fruit, flowers, and vegetables." It is further intended as a guide for amateur and practical gardeners, to enable them to understand more thoroughly the theory and practice of fruit and flower cultivation. Some of the pages of this treatise are devoted to a paper upon plant-cleaning, the subject being, of course, insect pests and diseases, and how best to combat them.

"CARNATION CULTURE FOR AMATEURS."—An illustrated handbook bearing the above title has lately been issued by Mr. B. C. RAVENSCROFT (publisher, L. UPCOTT GILL, 170, Strand). The little volume contains instructions for growing Carnations of all classes in the open ground and in pots, with somewhat scanty notes on insect foes and diseases. Various illustrations elucidate the book, which may be commended to the notice of amateurs as likely to be very serviceable to them.

"THE DISTRICT COUNCILLOR'S HANDBOOK," by J. C. SWINBURNE HANHAM (London: SHAW & Sons, Fetter Lane and Crane Court, E.C.). This volume is devoted, as the title implies, to such information as may be useful to District Councillors. It treats of the office, qualification and election of these officers; of their duties, powers and fees; and may be commended to the notice of those to whom it is addressed as containing valuable hints for their guidance.

STERILIZED MUSHROOM SPAWN.-According to the Bulletin d'Arboriculture for June, the Pasteur Institute in Paris is now working in the interests of horticulture. It now, in fact, offers to the horticultural public Mushroom spawn in two forms; sterilized, and in its normal condition, analogous to what French Mushroom growers know as blane vierge. The sterilized spawn is an entirely new product obtained by the germination of the fungus spores. This is pure, free from any other fungus spores but those of the Mushroom. It is raised from picked Mushrooms remarkable for size of productive and marketable properties. The Pasteur Institute undertakes to provide any variety which the grower wishes to have, and, if the Mushroom-fancier has any variety which he wishes to propagate, the Institute undertakes to secure the germination of that Mushroom of which he wishes for spawn. It will thus raise to order special spawu in as large a quantity as may be equired. The sterilized spawn yields rapid, regular, und considerable produce. It can be prepared in inlimited quantities.

MR. H. W. WARD. - After filling the position of head gardener at Longford Castle, Salisbury, for a period extending over twenty-five years, eighteen years under the late beloved Earl of RADNOR, and seven under the present peer, Mr. WARD, as we tre informed, has felt it advisable to resign his appointment, and is consequently at liberty to scept a fresh situation where a good staff of men s kept, and where gardening is carried on with pirit; or to undertake the management of a smaller place as steward and gardener. During his quarter of a century's management of Longford Castle garlens, Mr. WARD has made them what they are-one of the best known in the United Kingdom. During hat period of time also he has superintended the erecion and heating of pretty nearly all the glass-houses. ncluding a range of Orchid-houses, extended the amous Italian flower - garden, and considerably xtended and beautified the grounds, &c., besides vinning for Longford Castle at leading metropolitan nd provincial shows the reputation of being a good ruit and vegetable-growing establishment. With uch a record, it is to be hoped that Mr. WARD will ot be long without the employment for which his apacities emineutly fit him.

A NEW STRAWBERRY .- Fruits of a new Strawberry were brought by Messrs. J. VEITCH & Sons before the Fruit Committee of the Royal Hortical. tural Society's meeting on the 29th ult. at Chiswick. The fact that the next meeting at the Drill Hall does not take place until the 14th inst., a period of fifteen days later than the Chiswick meeting, was pleaded in extenuation of this unusual conrse, and cordially accepted. The variety in question, which rejoices at present in the somewhat grandiose appellation of "Majestic," is the product of a cross between British Queen and Waterloo. It is one of Mr. SEDEN'S raising, that experienced hybridist having occasionally dealt with fruits, as a change from Orchids. His first production in that direction seems to have been singularly successful. The fruits of this Strawberry have the round or semi-pointed form, and generally the deep colour of Waterloo, and all the flavour of British Queen; indeed, as a completely ripened or finished Strawberry, it was declared to be one of the richest-flavoured in cultivation. The variety is a large cropper, has the Queen erect foliage and form. with the Waterloo greenness. It is distinctly a late variety. The committee agreed to recommend at the next Drill Hall meeting that a First-class Certificate be awarded to it. We suggest that a more fitting appellation would be "Harry Veitch."

SOME NOTES ON ROSES SHOWN AT READING. -At the Rose show held by the National Rose Society at Reading on the 24th ult., no fewer than 3,980 blooms were staged in competition in the classes devoted to hybrid perpetuals, hybrid Teas, Teas and Noisettes, or 320 more blooms than at the Gloncester exhibition last year. Consequently, the Reading show was the largest provincial exhibition ever held by the society in the south of England. With the exception of those at Birmingham in 1890, and at Derby in 1895, it was, moreover, the most extensive show that has as yet been held by the society in any part of the kingdom, if we except the metropolitan exhibitions at South Kensington and the Crystal Palace, where the classes open to oxhibitors were, as a rule, nearly twice as numerous. Edward Mawley, Hon. Sec., N.R.S.

THE CEDAR FORESTS OF MOUNT MIANJE -One of the earliest acts of Sir H. H. Johnston's administration as Commissioner in British Central Africa was to declare the great mountain mass of Mlanje, in the south-eastern corner of the British territory, Crown property. The Commissioner's main object in doing so was to protect the remnants of the magnificent Cedar Widdringtonia) forests that were still found on Mlanje, and that this policy was a wise one is shown by the report which has just been addressed to the Commissioner by Mr. JOHN M'CLOUNIE, who is in charge of the Governmeut's forests in that district. In this report Mr. M'CLOUNIE says :- "I have now been all over the Ruo plateau and the Luchenya, and the Likubula gorge, and the Tuchila plateaux. The district round the source of the Tuchila is by far the best and most timbered part of the mountain. A few straggling trees are seen near the source of the Ruo, and only one of any size, while the Luchenya is dotted with Cedar along its slopes. The Likubula is well woode I. but the forests are almost inaccessible. On the plateau round the source of the Tuchila the ground is covered with compact Cedar forests, and may be estimated at 700 to 800 acres, on that around the Likubula about 200 acres, and a further 100 acres round the Luchenya. Giving the number of trees to the acre as 150, the total number of full-grown existing trees should staud at 150,000, with an average of 40 cubic feet of timber each. At the Present value of 3s. per cubic foot the total value of these trees would be £900,000. But if this timber was sold, as it ought to be, at 6s. a cubic foot, the wealth would be doubled. As I have gone all over the woods, and noticed quantity and quality, these figures may be taken as near the mark. It is no exaggeration to say that five or six years' more delay in the assumption of control over the remaining patches of Cedar forest would have meant the entire

extinction of this unique Conifer, which there is abundant evidence to show was once indigenous to all the high monntains and plateaux in the southern part of British Central Africa. Up to the present I have cut up nothing but dead wood which, in most cases, is in good, seasonable condition. The supply of timber yearly might be considerable, and not materially affect the forests for many years, especially as there are large numbers of young trees growing up in all the woods which must now be protected from fire. I have this season sown a large quantity of Cedar-seed, which should be ready in a year to transplant. The ground to be planted must be thoroughly hoed and cleaned to remove grass, &c., and prevent fires." Times.

TRENTHAM HORTICULTURAL SOCIETY.—We are requested to announce that the Trentham Horticultural Society's show will not be held this year, owing to the County Agricultural show being fixed to take place at the same date at Longton, of which place the Duke of Sutherland is the Mayor.

CATTLEYA LABIATA WARNERI.—There are now flowering at Laeken, near Brissels, in the gardens of H.M. the Kino of the Belgians, under the care of Mr. Kinoht, eight plauts of Cattleya labiata Warneri carrying 179 flowers, on fifty-eight flowering bulbs. One plant with twelve flowering bulbs has forty flowers. This is generally considered a shy-flowering Cattleya, but it is simply magnificent as here shown. Any one who wishes to see them may do so on application to the Superintendent of the Royal Gardens, Laeken.

EDINBURGH CHAIR OF BOTANY .-- In the House of Lords on Tuesday, June 30, a bill was read a second time which has for its object the transference to the Crown of the right of patronage to the Chair of Botany in the Edinburgh University which is now vested in the curators of patronage. It has hitherto been usual that with the Chair of Botany the professor should hold the office of curator of the Botanical Gardens, an office which was in the patronage of Her Majesty, and unless arrangements were made between the appointing parties considerable inconvenience would ensue. It was in the interest of the School of Botany that the same person should hold both offices, and with a view to facilitate this a departmental committee had recommended that the transfer proposed should take place, and the proposal had been agreed to by Her Majesty, the treasury, and all others who were interested.

GOREY ROSE SHOW.—The Gorey Rose Show was held in the grounds at Mr. CLIFFE OWEN'S residence, at Knockmullen, on Tuesday, June 23. The fixture was only established last year; and though it is conducted on a somewhat unpretentious scale, it has contracted considerable attention amongst the Rose-growers of the north of the county, as was shown by the number, variety, and beauty of the flowers exhibited on Tuesday. The Earl FITZWILLIAM, Coollattin Park, lent a splendid tent, and flowers were sent for exhibition by Mr. W. Dixon, Bellmount (who acted as judge), Mr. Steele, of Earlswood, and Mr. Wilson, of Shillelagh. The fine collection of Roses, Begonias, and Orchids of the first named gentleman were a centre of attraction, while the contributions of the two latter were also much admired. The Earl of COURTOWN lent some plants for the decoration of the tent. The band of the Wexford Regiment, which was in attendance, played a choice selection of music during the day. The Roses were not up to the standard of last year, a fact which is, however, wholly attributable to unfavourable weather. On the whole, Messrs, George Mercer and Cliffe Owen are to be congratulated on the result of their efforts. Extract from the Enniscorthy Guardian.

FLOWERS IN SEASON.—A correspondent residing at Reading, Mr. S. Kemonoen, sends us some very pretty, fragrant flowers of seedling Carnations, raised from seeds sown, so he tells us, about a year ago. Everyone with space at command should grow

Carnations from seed, for the produce is sure to be varied and pretty, the plants strong, and the blooms abundantly produced; there is, moreover, the excitement of waiting for the opening of the flowers, and, may be, securing a flower of the first water.

PUBLICATIONS RECEIVED. -Annual Administrative Report of the Forest Department, Madras Presidency, for the Year ending June 30, 1895 .- Bulletin of the Botanical Department, Jamaica, edited by WIL-LIAM FAWCETT. Among the contents are: Notes on Citrus Fruits, Synoptical List of Ferns, continued; Sarsaparilla, and other papers. - Farmers' Bulletin, No. 38, U. S. Department of Agriculture; "Spraying for Fruit Diseases," by B. T. Galloway, - U.S. Department of Agriculture, Division of Entomology; some Mexican and Japanese Injurious Insects liable to be introduced into the United States. -New York Agricultural Experiment Station, Bulletin No. 100, "Combating Carnation Rust," by F. C. Stewart.—Bulletin No. 101, "Potato Diseases of Long Island in the Season of 1895," by F. C. Stewart.—Minnesota Botanical Studies.—Bulletin No. 9, April 30. Contents :- "Distribution of the North American Helvallales," Lucien M. Underwoon; "Physiology of Root-tubers of Isopyrum biternatum," D. T. McDougal; "Plants Collected by Dr. J. H. Sandberg in Northern Minnesota," J. M. Holzinger; "Changes in Dry Weight of Leaves of Helianthus," S. Thompson and W. W. PENDERGAST, &c. - Vegetations, Biologic von New Iceland, Von L. Diels.—Bulletin No. 132, Michigan State Agricultural College Experiment Station: "Some Injurious Insects," by G. C. Davis. - Ros Rosarum, by E. V. B., 2nd edition, Elliot Stock. - Arboricalturists and Others in North Germany, Macfarlane & IRSKINE.

BOOK NOTICE.

GARDENERS AND CRICKET.

We hear little now-a-days of those who follow the gardening profession distinguishing themselves in any branches of sport. This is probably owing to the fact that recreation outside the limit of the sphere of a gardener's labours is practically impossible, since plants, like children, require constant attention; and this was never more apparent than at the present day, when our greenhouses, conservatories, and hothouses are stocked with plants from almost every part of the world.

We have in our mind the names of a few prominent gardeners who delight in the good old English game of cricket, and it is interesting to be told that over a century ago three of the most celebrated cricketers of the day were gardeners in large establishments. A dainty little volume that has just eome into our hands, entitled Annals of Cricket, by Mr. W. W. Read, a famous Surrey player, contains some curious descriptions of these "wielders of the Willow."

Edward Stevens was gardener to the Earl of Tankerville at Walton on Thames, was also the most famous bowler of the day, from 1760 to 1790. He is said to have had an eye trained as straight as a plant, that he could pitch a ball 22 yards' distance, and hit a daisy four times out of six attempts. He was nicknamed "Lumpy," on account of his solid build. About the same time H. Minshull and W. Rumney were famous cricketers; both were in the gardens at Knole Park, Sevenoaks, at that time the seat of the Duke of Dorset. These men used to be taken about by their employer to play in different counties, a proceeding that may have been very well for cricket, but must

have been extremely tantalising to the head-gardener. Minshull is stated to have been a very fine batter, but as conceited as a wagtail. If description goes for anything, another leading player, in the person of Tom Taylor, must surely have been associated with some horticultural pursuit, for he is measured-up as "a country clod-stumper, with a wilted applejohu face, and skin like the rind of an old Oak, and quite as sapless." He was a regular Daisy-cutter. George Brockwell and Daniel Hayward were giants at the game some fifty years ago. They were both famous in the history of Surrey cricket, and the latter, who put in his gardening apprenticeship at Mitcham, became noted for his abilities in cricket parlance as "an exceedingly showy hitter" and "fast field."

The book contains many illustrations of past and present cricket fields, and also an instructive chapter on the management of a cricket ground (2s. 6d., Sampson, Low & Co.).

LEADER STRAWBERRY.

The number of new varieties of Strawberries is constantly increasing, and in some of them there are points which will tend to keep them in cultivation for a long time. Messrs. Laxton, of Bedford, have been noted for many years past for the general excellence of the Strawberries of their raising, and in the present instance they are sending out in Leader a variety of fine appearance, prolific, and admirably adapted for forcing as a second early. They inform us that it is excellent for outside culture. Our illustration (fig. 6), which shows the plant and fruits of less than half size, was taken from an example sent to us for our inspection on the 2nd ult.

HOME CORRESPONDENCE.

PLANT NOMENCLATURE.—The recent publication of the Index Kewensis, has caused much discussion upon this subject. It seems to me that the names of plants are becoming more confused year by year. Disregarding the utter confusion which exists in the names of garden varieties, could not some steps now be taken so that there may be only one name recognised for each species of plant? Now, what are the steps to be taken? I would suggest that the Royal Horticultural Society should pass a resolution declining to recognise a plant under any other name except that under which it is catalogued in the Index Kewensis. Could not nurserymen, too, agree only to apply to a plant the name under which it is designated in the above work / Could not you and the editors of other horticultural publications come to a similar agreement! I am well aware of the difficulties in the way of bringing about this result. At the same time taking into consideration the advantages which would be conferred, and the confusion which would be saved, is it not now worth making a determined effort in this direction, now that we have a standard work to which we can refer? E. D. Tillett. [As a general rule, we make it a practice to conform to the Index Kewensis, but we cannot always stop to see if a name cited by a correspondent, or even one used by ourselves, is in conformity with the Index. ED.]

time was about to arrive, I dreaded to have to again haul down the nets from the loft, where they had been put away since they were used last year, only to find them, as usual, full of rents, and perhaps also rotten with either the dry or wet rot. Having considered how very cheaply galvanised wire netting may now be bought, I made up my mind to give it a trial this year, and procured some coils of netting of 1 inch mesh, and 2 feet wide for the sides. For covering the top I selected wire netting of 3 feet in width, with a mesh of $1\frac{1}{2}$ inch. Our Strawberry-beds were luckily exactly 12 feet wide, and the lengths various, so that there was no difficulty in forming the enclosure. The wood scantling used as a framework was 2 inches by 1 inch. The netting 2 feet, and 1 inch mesh, was soon fixed to a framing round the sides of the bed, and for the netting 3 feet wide framing was made to place over the top. This done, the structure was complete, and the Strawberries were safe from the predatory visits of the

blackbirds and thrushes. Nothing could be more simple or cheaper, I think, in the end than this. When protection is no longer required, the wire at the sides may be rolled up, and the framings on the top stacked away in a dry place, in readiness for another year. When we gather the fruit, all that the gardener has to do is to lift off the top framings, lay them on top of the others, and so proceed until the required quantity is picked. The sides might advantageously be made, say, 6 feet high, and the roofing fixed at the same height, which would obviate the necessity of removing the top framings when gathering, a doorway admitting to the enclosure. I have, however, stopped short of this commodious method, feeling satisfied with the present arrangements; but to render the Currant and Raspplantations secure the higher form will have to be adopted. The birds look with longing eyes on fruits under the nets, but they are not altogether without the opportunity of having a taste of them; without the opportunity of having a taste of them; nor do I see any reason why they should, seeing how much good they do by ridding us of slugs and caterpillars, besides enlivening the garden by their song. They are left, entirely te themselves, an old Strawberry plantation, from which a tolerably good feed can be obtained. All this kind of protection may not be wanted in gardens less surrounded by trees and shrubs, but at Coombe Abbey the protection of such kinds of fruit becomes a necessity. W. Miller.

VIOLA OR TUFTED PANSY .- An attempt is being made in certain quarters to induce cultivators of that section of Pausies denominated Violas to drop this title and substitute for it "tufted Pansy." What is meant by Viola is clearly understood, and as the term has been employed ever since the late Mr. John Wills brought Viola cornuta into such notice as a bedding plant, the employment of the term is sanca bedding plant, the employment of the term is scarcely a compiler of a catalogue of Violas who does not employ the term, and in order to show how inapplicable is the term "tufted Pansy" to many of the Violas, an inspection should be made of the extensive trial of a considerable number of the leading varieties now being carried out by the Viola Conference in the gardens of the Royal Botanic Society in the Regent's Park. It will be perceived that a large majority of the varieties, instead of having a tufted habit, i.e., close, dwarf, and compact, they have an erect, tall, spare habit, and almost need the support of stakes to keep them in an unright position. A great many of the new Violas of the present day are selected, not because they are adapted for bedding purposes, in the decoration of the flower garden, because they are thought to have a value for forming sprays for exhibition purposes, and their habit ceases to become an important consideration. This is unfortunate, because misleading. Certificates of Merit are awarded to cut blooms, the varieties are in consequence purchased for flower-garden use, the habit of growth is found to be objectionable, and disappointment results. The main reason why the trial of Violas has been instituted at the Regent's Park is to enable a selection to be made of those best adapted for flower-garden purposes; ou the other hand, many of the fancy and show Pansies (named varieties), have dwarf and compact habits, and have much more claim to be regarded as tufted than many of the Violas. I desire, therefore, as a lover and cultivator of the Viola, to see the old and distinctive name retained; its use does not lead to any confusion, it is readily understood, it is sanctioned by usage, and it differentiates in an intelligible manner the bedding types from the large show and fancy Pansies. R. D.

PER-SIMON NOT PERSIMMON.—It may interest my friend Canon Ellacombe to hear that the recent Derby winner was not named after either Diospyros virginiana, or D. Kaki, as he suggests on p. 790 of your last issue; but that the name of the horse should really have but one "m," as written at the commencement of this note. The origin of the name was, I believe, that the name of the horse's dam began with Per, and its sire was St. Simon, and that accordingly the colt was given a name made up for the occasion out of a syllable from the names of each of its parents. W. E. Gumbleton.

ROYAL HORTICULTURAL SOCIETY'S CERTIFICATES.—A young member of the Fruit and Vegetable Committee, whose sympathies may be naturally with new things rather than with old, recently raised the not unimportant question at one of the committee meetings as to the propriety of granting Awards of Merit or Certificates to old things under any circumstances. That the committee declined to discuss the

subject doubtless showed wisdom, as the proposal might have led to long discussion practically useless at ordinary meetings. But there is matter in the proposal for discussion, although it may be thought that the subject was rather one for the Council to determine, though that body may be as indisposed to fetter the action of the committee as that committee seems unwilling to fetter itself. Now it is true the objects of the committees are "to

meeting to Rhubarb Victoria, one of the very best incommerce, but which never before obtained an award. At the same time a similar award was made to a new variety—Collis' Seedling. Both these were grown at Chiswick for comparison, and sample bundles, with others, were brought up to the Drill Hall for the committee's inspection. Now, excellent variety as is Collis' Seedling, it is not a bit better than is the old Victoria. Still, when subjects are sent

great love for awards to old things, which everybody has, because, from a trade point of view, there is no money in them; but there are others who would very ruthlessly trample that objection under foot. It is as much the business of the committees, by their awards, to make known to the world what are good old things as well as good new things, because the gardening world wants not so much the newest as the best. If there were an order or instruction issued to the com-

Fig. 6,—"LEADER" STRAWBERRY. (SEE P. 18).
(Raised by Messrs, Laxton Brothers, Belford - Foliage and fruits half-intoral side.)

encourage the production of new and improved varieties of fruits, flowers, plants, vegetables, &c.," but there is no restriction imposed with respect to awards to old things. On the other hand, the growing of old-established things at Chiswick for purposes of comparison is distinctly encouraged, and it has always been the practice there to give the full number of marks to good old things, so grown, as to meritorious new ones. The particular case which provoked the proposal of the member in question was the granting of an Award of Merit at a recent

to Chiswick for trial, the Fruit Committee does not like to treat them, as it were, with contempt, simply because they may not be better, though perhaps they are as good as older varieties are. Those who send these diverse things are entitled to some encouragement. Still, if Collis' seedling merited an Award of Merit, unquestionably such an old and tried variety as Victoria did so as well; and because that was the general feeling, the award to this old thing was made. I can very well understand that in some quarters there is no

mittees that under no circumstances should awards of merit or certificates be granted to anything unless the thing in question is a distinct advance on any similar old variety, the order, though right enough and logical, would still seem harsh and prohibitive, but it would materially reduce the number of awards now made. But why any limit should be placed on the present powers of the committees to recognise the merits of good old things as well as of new things—not always good, all of them—is difficult to understand. Many old things still so good as to be

universally grown never met with awards of any description; some, indeed, came into being before the committees did. It is hard to understand why they should not receive now the same recognition that the committees grant to their younger compeets. A. D. [The form of the award should be different in the two cases and then no objection could be raised. Ep.]

FASCIATED PEA.—When looking round a gentleman's garden lately I came across the enclosed curiosity. I thought it would interest you to see it. This tufted Pea is a chance seedling the seed of which has been saved for the past three years. My friend, who is an enthusiastic gardener, thinks highly of it, and gets a good crop of useful Peas from this novelty; average height, about 4 feet. Personally, I never saw a Pea of this habit before. Please give me your opinion through the columns of the Gardeners' Chronicle. D. Crombw. Powerscourt Gardens, Enniskerry, Ireland. [The stem is fasciated, producing a cluster of Peas at the top, like the so-called Mummy-Pea, which occurs occasionally, and excites so much attention. It has nothing but the name to connect it with mummies. Ed.]

LENT LILIES.—The very clerical—or shall I say, rather, ecclesiastical—term of Lent, applied both to Helleberes and Daffodils, is distinctly fantastic, and it may well be said, very absurd. Every flower, no matter what, that blooms during Lent might just as well be termed Lent something, as the flowers named are so dubbed. But in the case of the circular referred to at p. 765, vol. xix., in relation to prizes for plants, it would seem as if the author had got mixed over Hellebores and Daffodils, for whilst the forms of Helleborus might have been commonly known as Christmas Roses, the later forms of H. orientalis or colchiens have had given to them the more modern appellation of Lent Roses. But it is more ridiculous to term these flowers Roses, than it is to term Daffodils Lent Lilies. The nse of terms or names in this eccentric and misleading fashion by herticulturists is specially reprehensible. D.

MEALY-BUG ON VINES. — In last week's issue of your valuable paper you recommend "J. M. R.," on p. 796, to furnigate with XL-All, as a means of partially ridding the vinery of this pest, and assert that it will not injure the Vines. With the directions given on each bottle of XL-All, gardeners are cautioned not to use it for Lady Downes and Muscat Grapes, both of which I know from experience it will injure. As many gardeners no doubt will follow the advice given to "J. M. R.," my remarks may be of good service to some of them. F. C. Edwards. [We have used it without injury but with great success in a small house where Black Hamburgh and Syrian were grown and terribly infested with mealy bug. Eb.]

STARCH-POTATOS .- "D. T. F." thinks that we may here at home take successfully to the cultivation of Potates for the production of starch as a manufactured article of trade. I am not sure that taking an average of seasons, we get soil warmth enough in this country to produce a maximum of starch in the tubers. Then it would seem as if the German varieties, grown specially for the production of starch and be transformed into alcohol, contained of sugar, to both these elements in a greater degree than our home-raised or the American varieties do. If that be so, it may be due either to long special breeding to secure those features, or to greater soil-warmth during the tubering season, in time creating those elements in a marked degree. One thing always has been known; it is, that the smaller tubers are invariably more starchy in flesh than are the larger ones, as these latter largely owe their greater size to excess of water, due probably to breed, to But, as high culture, and to robust top-growth. "D. T. F." says, the whole thing needs to be investigated, and in a thorough way. Apart from chemical analysis, we want to have Potatos grown so diversely that effects may be fully tested. A. D.

STARCH AND SUGAR CONTENTS IN POTATOS AND IN ROOT-CROPS.—In reference to the remarks of your correspondent D. T. F.," at p. 768, vol. xix., a few more notes may be quoted upon the subject from illustrations obtained by Lawes and Gilbert at Rothamsted. But little is definitely known of the special functions of individual mineral constituents in vegetation. It is, however, pretty clearly established that the presence of potash is essential for the formation of the chief non-uitrogenous matters—starch and sugar. The published results of experiments at Rothamsted have shown that the proportion of potash in the ash of Wheat was the greater, the better matured the grain—that is, the larger the proportion of starch it contained; in the Potato

was found a greatly increased amount of potash in the heaviest crops, that is to say, in those in which the largest amounts of starch have been found. The results of cooking several samples of Potatos, grown in the Rothamsted experiments, showed that the nutty flavour of the tubers depended very much upon the quantity of petash taken up during growth. Hence the immense value of a sufficient supply of potash in the soil, or of an artificial application in the form of kainit salt, or sulphate The Rothamsted experiments potash. show that high specific gravity in Potato tubers, and high percentage of dry matter go tegether. total amount of dry matter produced per acre is considerably increased by mineral manure alone (containing petash), but very much more when the mineral and nitrogenous manures are used together. Thus the produce of dry substance of tubers was, without manure, 1353 lb. per acre; with purely mineral manure, 2384 lb.; and with the mixture of mineral and nitrogenous manure, more than 4000 lb. per acre. The produce of starch per acre is 1120 lb. without manure, and 1988 lb. with purely mineral manure; but with both nitrogenous and mineral manure the quantity of starch is raised to an average of 3400 lb., or about 14 ton per acre. Here, then, in the Potato, we find a great increase in the production of the non-nitrogenous constituent, starch, by the use of nitrogen in manure, just as in the root-crops, has been found a great increase in the produce of the non-nitrogenous constituent, sugar, by the use of nitrogenous manure, when combined with potash. The same thing holds good in the production of sugar in Grapes. There is, however, under corresponding conditions as to mannre, somewhat more sugar produced in Mangel-Wurzel for I of nitrogen in manure, than of starch in the Potato. Thus, with similar mineral manures (containing potash), and the same amounts of nitrogen supplied, was obtained, reckoned over the produce by the mineral manures alone, in Mangel Wurzel 19 parts of sugar for 1 of nitrogen as ammoninm-salts, against 16.8 parts of starch in the Potato; and for I of nitrogen as nitrate of soda, was obtained 22 I parts of sugar in Mangel Wurzel, and 16.1 parts of starch in Potatos. In Sugar-beet, however, there was even much more sugar produced for 1 of nitrogen—namely, when as ammonium-salts 25% parts, and when as nitrate of soda 3% parts. As then the root-crops are essentially sugar-yielding crops, so the Potato is essentially a starch-yielding crop; and it is seen that, provided the mineral constituents, and especially potash, are not deficient, the produce of both sugar and starch is greatly increased by the amount of nitrogen available to the plant within the soil, whether derived from previous accumulations, or from direct nitrogenous mannring. Another point to which attention may be called is, that from 80 to 85 per cent. of the total potash of the Potato tuber, and about two thirds of the total phosphorie acid, are found in the juice. And when it is borne in mind that two-thirds or more of the nitrogen existing as albuminoids is in the juice, it is obvious that if the mode of cooking the Potato is such as to exclude the constituents of the juice from the final food-product, there is considerable waste of nutritive matter, and the nutty flavour of the Potato is sacrificed. J. J. Willis, Harpenden.

ORCHIS FOLIOSA.—This fine Madeiran terrestrial Orchis has for several years spontaneously produced seedlings in my garden. Most of the seedlings have spotted leaves, and seem to be intermediate between O. foliosa and O. maculata, which is so prevalent in the soil of my fields as to come up casually and flower in the borders. I mention these apparent hybrids because in the Drill Hall on Tuesday, June 9, Mr. Pritchard, of Christchurch, exhibited several very fine heads of dark purple flowers labelled O. foliosa, which I at once recognised as belonging to these intermediate forms. Also in the rock-garden at Kew, in one of the flat basements on the right-hand side as you face south, there are two clumps of these intermediates. One of the clumps has the spotted leaves of ordinary O. maculata, the other has the foliage of O. foliosa; but the flowers, though magnified, of O. miculata, or rather of those very fine forms of maculata which are not uncommon where O. latifolia and O. maculata grow together, and of which a variety long known as O. maenlata superba, or the "Kilmarnock Orchis," was one who frequents Kew and studies terrestrial Orchises, that he will examine the plants of which I I have had hundreds of imported Orchis foliosa from Moleira, but never saw any like those which Mr. Pritchard exhibited, or those of which I speak as now in flower at Kew. C. Wolley Dod, Elge

LATHYRUS DRUMMONDI. - This Everlasting Pea has been superb with me this season. It is planted against a wall of medium neight, and the having attained to considerable strength, covers a against a wall of medium height, and the plant large space, and blooms with astonishing freedom. got it originally from Mr. Charles Green under this name, and take it to be a selected form of L. rotundifolius, but yet differing a little in some respects. [See Gard. Chron., July 1, 1876, p. 16. Ed.] The flowers are of a bright orange carmine tint, but like most of the Everlasting Peas they fade rapidly. I have grown L. rotundifolius by the side of it, and have come to regard L. Drummondi as earlier, freer of bleom, and more vigerous in growth, while it does not flower so freely as the former, and sets its seedpods more abundantly. By the side of it is L. latifolius, the shoots of which find their way among those of L. Drummondi, and the former keeps up the floral procession after the latter has done blooming. The sheets of Clematis Jackmanni, and those of magnifica, also ereep among those of the Everlasting l'eas, and form a charming combination. find germination is hastened by soaking the seeds in water for a few honrs before sowing. R. D.

BIROS AND INJURIOUS INSECTS. - Your correspondent, Mr. Joseph Collinson, at p. 711, vol. xix., makes a humanitarian plea for the preservation of insect-eating birds, in a temperate and reasonable manner, and I quite agree with him that to destroy tom-tits is to destroy one of the gardener's and fruit-grower's hest friends. The only predatory acts that I can lay to the tom-tit's charge are a fondness for late Peas, and a nasty habit of pecking the stems of nearly-ripe Pears; but I believe that a few lnmps of snet tied up in their haunts would enre them, or rather prevent them doing this, their only mischieveus acts. Sparrows are in a different eategory; the only harm they do us is to choke the water-sponts with their nests, and drive away the swallows by occupying their nests, but as sparrows increase at an incredible rate, they want to he kept in bounds, and cultivators should use their discretion. Our place is fairly a bird's paradise. We are surrounded with thousands of all kinds of hirds, and if I were not liberally supplied with netting, crops of small fruits would be out of the question. My own view on the bird question is, that with plenty of netting the only bird that it is needful to destroy is the bullfinch, as they will destroy more fruit-buds in an honr, than would keep a dozen blackbirds a week. One year before I took to destroying them they ate every Apple-bud we had on the place; but in such a season as the present one, owing to the ungenial weather, cold nights, bright snoshine, and harsh drying weather, combined with the drought, all kinds of vegetation received a check, but at the same time all kinds of insects are present in such incredible numbers that the ingenuity of man and the insecteating birds are powerless against them. On a broad scale, of course bushes, wall-trees, Roses, and such like with the aid of insecticides the cultivator succeeds, but in the case of the large trees and shrubs caterpillars innumerable are the masters of the situation. I have euclosed a few shoots of Oak trees taken out of a large rockery about 100 yards from my house. There are thousands of rooks who are now living on the caterpillars. I can hear them eaving as I am writing-a peculiar noise they always make when feeding on caterpillars. The tops of the Oak trees are worse than the shoots sent, and I daresay there are 100 acres of trees round about whose leaves are similarly perforated, and the tops of which look as if scorched. It seems that an unhealthiness in a tree favours the production of insect-life, just as an unhealthy condition of living produces disease in the humin subject, or in animal life generally. R. M., Newhary, June 8. [The shoots our correspondent forwarded for our inspection were covered with skeletonised leaves. Ed.].

MYATT'S ELIZA STRAWBERRY. — This old variety is, no doubt, excelled by some of the new varieties in size, but by few, perhaps, in the good quality of the fruits; for hardiness of constitution and prohitic hearing, Myatt's Eliza can still, however, held its own. G. W. [A capital variety, of strong growth, once thought much of by market growers and private gardeners. Its coleur, pale red, is, perhaps, against it. Our correspondent sent a number of fruits of good size and flavour and fair colour. Ed.]

THE LATE BRUCE FINDLAY.—Seldom have I felt the loss of a comrade more than that of this lost gentle and gifted spirit. Though rather widely parted, we were ever one in sympathy and spirit in all that concerned the advancement of horticulture, the elevation of horticulturists, and

the amelioration and ennohlement of the common working life of our country through the sweetness and the light distilled and diffused among the masses and the elasses through such efforts as those so successfully initiated and sustained by Mr. Findlay for so many years at Manchester. We are losing so many leaders and veterans, that horticultural life in its social side seems less worth loving than it used to be, though we hope we shall never lack young men to fill their places: though of Bruce Findlay, as of some others we have lately lost from our midst, it may all too truly be said, "We ne'er shall see his like again." D. T. Fish, 12, Fittes Row, Edinburgh.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JUNE 23.—Present: Dr. M. T. Masters (in the chair); Dr. Bonavia, Mr. Douglas, Rev. G. Henslow (Hon. Sec.).

Dianthus, Colours of.—With reference to the colours of Carnations, Mr. Douglas observed that the yellows are apt to revert to other colours, and mentioned as an instance of 200 seedlings from a yellow, among which no yellow appeared.

Cabbage Palm Fruit.—Mr. J. H. Maiden, successor to Mr. Ch. Moore, formerly curator for fifty years of the Botanic Garden, Melbourne, sent some fruit. They are small and globular, about the size of marbles. The Palm is Livistona australis, described as a tall and graceful tree, 80 feet in height. They were forwarded to Chiswick to be grown.

Tomatos, Monstrous.—Dr. Musters exhibited some Tomatos of the modern globular form, remark dde for possessing small exserted supernumerary carpets. These had grown on the placentas in the place of ovules. It was not uncommon in the old grooved Tomatos (due to the flowers having been synanthic), but it had not appeared before on the smooth fruit. It was received from Mr. Dixon of Chester.

Pinus Lambertiana. Dr. Masters also showed a shoot of this tree, known in California as the Sugar Pine, bearing numerous orange coloured male catkins

Carious Moss-growth.—Mr. J. P. Way, of Warwick School, sent a remarkade specimen, found near the New Forest. It was of the shape of a double convex lens, about 6 inches across; the stems all radiating from the middle. It was forwarded to Dr. Braithwaite, who reports as follows:—"The moss is Leucobryum glaueum, common in this state, but very rare in fruit. It grows under two conditions: (1) In boggy heaths, when it takes a more expanded form, being always wet; (2) in woods, where it occurs in circular patches, beginning of the size of a sixpence, rooting, and going on increasing to the dimensions of a half crown. The brunching goes on centrifugally, and the tufts are so dense that the easiest way for them is to be between the surface of the ground and the older stems above. Then, probably, after the first heavy rain, the cushion swells up like a sponge, and is torn away from the earth, to become a white lump when dry, which is then blown about by the wind, just like the Rose of Jericho, Amastatica Hernochumitica. The plant would not grow again as a whole, but it throws off small ones, which grow and form new colonies." (See Br. Moss Flora, p. 85.)

PEOPLE'S PALACE HORTICULTURAL.

June 25, 26.—The summer exhibition of this society, the second of the three shows held every year, took place in the Queen's Hall of the People's Palace, Mile End, on the above dates. One most gratifying feature which characterised this show is the remarkable growth in the quality of the exhibits which come from what is known as the "congested districts"—Stepney, Mile End, Linebouse, Canning Town, Bow, &c., where the conditions of cultivation are unfavourable. The institution of these periodical competitions has stirred exhibitors to emulate each other in the production of plants, and no effort is spared to win prizes. The main body of the exhibitors is composed of labourers, mechanics, &c., and a number of them are engaged in warchouses in the City, being away from home all day.

The growth in the number of exhibitors resident in these districts has been as remarkable as the improvement in the quality of the exhibits, and at the show just held there were as many as ten entries for a collection of plants, filling a table space of 9 superficial feet, and the same number with three plants, foliage or flowering. The leading flowering plants are Pelargoniums of various types, even the show varieties being represented, and the scented-leaved also; Mimulus in plenty; but while common Musk predominated, there were examples of the improved large-flowered types; Fuchsias, among them some very good specimens—one, a huge fan-trained plant, quite a load to carry, shown by a libourer named II vanox, who grows it in the single room occupied by himself and wife; Creeping Jennies, some of them admirably grown and bloomed; Hydrangeas, Tuberous-rooted Begomas, Lilies, auratum and longiflorum pred minating; trailing Campanulas, Canterbury Bells in pots, &c., and of foliage plants, India-rubbers, very healthy and bold in leafage; Begonias of the Rex type; Anthericum variegatum,

a very favourite East-end plant; Ferns, including some exotic types, as well as our hardy British species; annual Tobaccos, &c. Fern-cases were a most satisfactory feature, and some pretty hunches of Sweet Peas were also present.

Outside of the congested districts are localities more favourable to plant growth than those lying in the centre, and the dwellers in these exhibit by themselves; but as the society is now rapidly extending in the direction of the more open districts of Leyton, Walthamstow, Forest Gate, &c., where the conditions of cultivation are even more favourable, these will be grouped by themselves, so as to equalse the competitions.

At the end of the month of June, forecourt and back gardens are visited for the purpose of awarding prizes for good-keeping, &c., and recently the judges, Messrs. R. BALLANTINE and R. DEAN, visited about forty of these, and found some pretty gardens, both in the more crowded and in the open districts, but they have recommended to the committee that all gardens be planted and entered for competition by the first week in June but that the prizes be not awarded till the month of August. In November greenhouses are inspected, that being the time when the Chrysanthemum is a prominent plant, and the inspection takes place just previous to the Chrysanthemum show at the People's Palace.

The exhibits, which filled the spacious Queen's Hall, were varied enough to interest all classes of visitors. The show extended over three days

CROYDON HORTICULTURAL.

Ji Ly I. The annual exhibition of the Croydon Horticul tural Society was held on Wednesday last, in the grounds of Wellesley House; and Roses, as is usual at this show, constituted the more important part of the display. In quality, these flowers were not equal to that common it Croydon, nor were they remarkable in quantity. Many entries were made by growers, who at the list moment were unable to exhibit; and from several of the leading amateurs we learnt that the best of their blooms hed passed. The exhibition was of a varied character, and some capital plants and general horticultural produce were staged, including a good display by cottagers. The weather was showery. A sale of flowers was organised for the benefit of the Royal Gardeness' Orphan Fund.

Nerseymon. The first class in the nurservinen section wfor forty-eight blooms distinct, to the 1st prize for which, was added the National Rose Society's Medal. There were four collections, and the 1st prize we sawarded to Mr. B. R. Cyst. Colchester. The quality of the blooms was moderate, some of them being very good, but most of them sin dl. The best were Earl of Dufferin, Dr. Andry, A. K. Williams, Duchess de Morny, Fisher Holmes, Xivier Olibo, Horace Vernet, Ethel Brownlow, Madame G dirielle Luizet, Marie Baumann, Madame Victor Verdier, Alfred Colomb, Cupt in Haward, Prince Arthur, and Pride of Waltham. Messrs, F. Cyst & Co. Colchester, were 2nd, and Messrs, D. & W. Cholt, Dundee, 3rd, both collections being of good proportionate quality, judged by that of the 1st prize collection.

The winners of the class for twenty-four trebl's were Messrs Prior & Sons, Colchester; and, although the blooms were lacking in size they were even in regard to size, and of fuir colour, Madame G. Luizet, Alfred Colomb, Pride of Reigate, and Horace Vernet, being some of the best, though the last-named was rather burned.

Twenty four Roses, distinct, were hest from Mesars, G. and W. H. Burch, Rose growers, Peterborough. Gustave Piganneau, Ulrich Brunner, Alfred Colomb, Reynolds Hole, Maman Cochet were among the hest blooms. Mr. G. W. Piper, nurseryman, Uckfield, was a very good 2nd; and Mr. Jno R. Box, Croydon, was 3rd.

Tens and Noisettes were much better shown in these classes than by the amateurs.

The best eighteen blooms, distinct, were from Messrs-Prior & Sons, Colchester, and in their exhibit were commendable examples of Catherine Mermet, Niphetos, Innocente Pirola. Madame de Watteville, Madame Cusin, Princess of Wales, and Souvenir de S. A. Prince; Messrs, Cant & Co. were 2nd; and Messrs, D. & W. Croll were 3rd

The last named exhibitors were 1st for twelve Roses of one variety, and staged very fine blooms of Mrs Jno. Laing. Mr B. R. Cant, with Gustive Piganneau, was find, and Messrs, F. Cant & Co. 3rd with indifferent flowers of Mrs Jno. 1 sing.

Twelve Tea or Noisette Roses (one variety) were best shown by Messrs. Frank Cant & Co., who showed Madame de Watteville; and Messrs. D. & W. Croll, who had Innocente Pirola, were 2nd; and Messrs. G. & W. H. Burch ard, with Catherine Mermet.

3rd, with Catherine Mermet.

Amoteurs.—There was no competition in the principal amateur's class, and the Challenge Cup, value 25 guineas, becomes the property of the Rev. J. H. Penberton, Havering, Essex, who beside exhibiting on this occasion took 1st prize in the same class last year. The thirty-six blooms exhibited on Wednesday last were good, compared with the average quality at this show, but not equal to this fortunate amateur's usual exhibits. François Michelon (Medal bloom), Earl of Dufferin, General Jacqueminot, Madaine Engène Verdier, Exposition de Brie, Juo Stuart Mill, Marie Baumann and Jeanne Dickson were the best and fresheet blooms.

mann, and Jeanne Dickson were the best and freshest blooms.

H. V. Machin, Esq., Gateford Hill, near Worksop, was the winner in the class for twenty-four blooms, distinct. His

stand contained the best bloom of Mrs. Jno. Laing shown in the amateur classes, and it gained a Silver Medal offered by Messrs. Jno Laing & Sons. There were other fine blooms in the stand, but some of quite ordinary quality were apparent. The Rev. J. H. Peuberton was 2nd; and F. W. Camplon, Esq., Colley Manor, Reigate, 3rd. Teas and Noisettes were poor

The 1st prize for eighteen blooms, in not fewer than twelve varieties, was taken by E. M. Bethuxe, Esq. Denne Park, Horsham. The best blooms were The Bride, Catherine Mermet, and Comtesse de Nadaillac. H. V. MARIN, Esq. was 2nd; and F. W CAMPION, Esq., Colley Manor, Reigate, 3rd

Six Roses, distinct, in trobles, were best from the Rev. J. H. Pemberrox, who had a very commendable stand in this class, Her Majesty, Mrs. Jno. Laing, Gustave Piganneau, Marie Baumann, A. K. Williams, and Caroline Testout were the varieties shown. H. V. Machin, Esq., was 2nd.

For twelve Rose blooms of one variety, a stand of Her Majesty, in good average condition, won the highest prize for H. V. Machin, Esq.; E. M. Bethuke, Esq., was 2nd with Francisca Kruger; and T. B. Haywoon, Esq., 3rd, with Afred Colomb.

Growers of fewer than 2000 plants in a competition for twelve Roses distinct, were only two. The 1st prize was capitally won by Mr. E. Mawley, Rosebank, Berkhamsted, and E. M. Bethune, Esq., was 2nd. The last named was the only exhibitor in this section, of a collection of twelve Tea or Noisette Roses,

Mr E Mawley won for four Roses in trebles; and E. M. BUTHUNE, Esq., was 2nd.

Growers of fewer than 1000 Rose trees competed in a class for nine distinct blooms, and W. D. Freshfull, Esq. The Wilderness, Reigate, showed a nice lot in his 1st prize exhibit. Kepper H. Gefforn, Esq., Holyrood, Streatham, being 2nd

W. D. FERSHEFELD, Esq., won among growers of fewer than 500 plunts, for six Roses, distinct; and for six Tea or Noisette Roses.

The Challenge Cup offered to growers within 2 miles of Croydon Town Hall was won by A. C. Gifford, Esq., Temnson Road, South Norwood, with a collection of twelve Roses, distinct. M. Honoson, Esq., Shirley, was 2nd, and won the National Rose Society's Silver-gilt Medal; he also won the remaining classes in this section, viz., for six H.-P. Roses, distinct; say Tea or Noisette Roses, distinct; and for six Roses of one variety

PLANTS AND FRUIT, ETC

Nine ornamental foliage stove and greenhouse plants were cupitally shown by JNO. WARREN, Esq., Handeross Park, Crawley; his specimens of Croton Warreni and C. Evansiae, nus were splendid examples. P. Crowley, Esq., Haddon-House, Croydon (gr., Mr. J. Harris), was 2nd. J. ASTE Esq., Ross Rend, South Norwood (gr., Mr. F. Scott), won in a class for six such plants.

Six Exotic Ferns (distinct) were best shown by JNO. WARREN, Esq. He had excellent specimens of Davallia divaricata, D. Mooreana, Nephrolepis exaltata, N. davalloides forcans, and Microlepia hirta cristata. P. Crowley, Esq. was 2nd JNO. WARREN, Esq. won for four large Pa'ms, and in several other classes.

For a group of miscellaneous plants arranged on a space of not more than 100 square feet, the best competitor was I: H Cotrs, Esq., Caterham with a pretty group of low-statured plants, arranged with considerable taste.

The 1st prize for a smaller group was taken by T. Jer-Feries, Esq., London Road, Croydon.

Six plants of ornamental Dracemas were very fine from PHILLE CROWLEY, Esq.; and JNO. WARREN, Esq., was a capital 2nd.

The exhibits of plants suitable for the decoration of dinner tables were deserving commendation. Those shown by Mr. C. Lane, gr. to E. Il. Coles, Esq., Caterham, who was 1st, were of suitable size, of differing habit, and had been well cultivated. Mr. W. Garlick, Caterham, was 2nd.

There were many other classes for plants, including Pelargoniums, Caladiums, Begonias, Gloxinias, Coleus, Fuchsias, Selaginellas, &c.

Table decorations are usually pretty at Croydon. The 1st prize on this occasion was won by Miss Cooper, Sydenham Road, Croydon; Mr. A. C. Robinson, Roma, Wallington, was 2nd. The bouquets, sprays, and other florists' arrangements deserve mention.

deserve mention.

Fruit was not largely exhibited. The 1st prize for six dishes was taken by JNO. WARREN, Esq. E. M. BETHUNE, Esq., was 1st for three bunches of white Grapes; and J. FRIEND, Esq., for an equal number of bunches of a black variety, she wing good Black Hamburghs. FRANK LLOYD, Esq., Coombe House, showed fifty large and finely-coloured fruits of the very old Strawberry Princess Alice.

Vegetables were of moderate quantity. Mr. J. Johnson was let, with a commendable collection of nine varieties; and Mr. C. Perrett, gr. to Mr4. Fuller, Duppas Hill, was lat for six varieties.

Mocellanous, Messis Jno. Peed & Sons, Roupell Park Nursery, Norwood, Road, S.E., exhibited a group of hardy flowers of a miscellaneous character, including many varieties of Sweet Peis.

Another group of such flowers was staged by Messrs, J. CHEAL & Sons, Lowfield Nurseries, Crawley, garden Roses and Violas being shown in this collection.

Two large exhibits of Begonias were made by Mr. J. R. Box

Croydon; and Messrs, JNO. Larne & Sons, Forest Hill, S.E.; in the latter exhibit were interspersed other ornamental plants, and several new varieties of Gloxinias were included. Mt. Box's exhibit contained a fine lot of single and double-flowered Begonias, and miscellaneous plants of an ornamen.al character.

A large number of Boses were shown from the Park Hill Recreation Ground.

EALING HORTICULTURAL.

JULY 1.—This was the thirty-second annual exhibition, and was one of the best shows held recently. There were five tents, and they were all well filled, one with bunches of wild flowers and grasses, and plates of garden flowers, the latter arranged by school children on the ground; a second contained the cottagers' produce from the allotment gardens, and plants grown in their windows and forecourt gardens, some of the latter being very good. A third was filled with table decorations, bouquets, &c., a fourth with plants, and a fifth with cut flowers, fruits, and vegetables.

Non-competitive exhibits were very good. One from Mr. G. Reynolds, Gunnersbury Park; and one from Mr. J. Hudson, Gunnersbury House, were arranged with admirable taste; and so was a group of Japanese Maple; intershigled with white Lilies, from Messrs. Fromow & Sons, Turnham Green. Messrs. C. Lee & Sons, Ealing and Hammersmith, had an effective group of variegated and other ornamental shrubs; and eight boxes of cut Roses. Messrs. J. Veitch & Sons, Chelsea, had six boxes of cut Roses; and Mr. W. Russey, a box of blooms of his new Rose. Mrs. Runnsey. Groups arranged for effect were a good feature, the best of the large ones came from Mr. W. Roberts, gr. to W. J. Harris, Esq. Ealing; the small-sized one from Mr. J. Knightly, gr. to A Roeinson, Esq., Ealing.

Groups of dwarf plants arranged on tables made a good feature. Specimen plants are not so much cultivated at Laling as they formerly were, but some fair examples of Allamandas, Clerodendron Balfourianum, Vincas, Fuchsias, Plumbago capensis, &c. were staged.

Mr. J. Butter had the best six Ferns, including a good piece of Alsophila excels 1, and a good example of Asplenium nidus. Caladiums were very good, Messrs. J. Harral and W. Owen taking the leading prizes. The best specimen stove or greenhouse plant in flower was Clerodendron Baltourianum, from Mr. Boosey; the bett foliaged plant, Dracent Lindeni. Fuchsias, Begonias, bedding Pelargoniums, Mosses, &c., were all well shown

Cut Flowers.—The main interest in the show centred in the cut Roses. This year the class for twenty-four varieties was thrown open to all comers, and brought five exhibitors. Mr. C. Terrer, Slough, was 1st with bright, well-developed flowers; Mr. J. MATTOCK, Oxford, and Messrs. G. & W. Bereu, Peterborough, 2nd and 3rd.

There were several classes for locally grown Roses, but though shown in numbers, they were over-blown. Store and greenhouse cut blooms were well-shown in twelve bunches, Mrs. Booser taking the 1st prize with an excellent box. Boxes of cut Glovinias, Begonias, and bedding Pelargoniums were also shown.

Miss Lilian Hudson, Gunnersbury House Gardens, had three stands of flowers and foliage, very light and graceful, arranged in excellent taste; Mr. Boosey was 2nd. Baskets of flowers for a drawing-room were charming also, and wild flowers were tastefully arranged.

METHODS OF PROPAGATION, LAYERING.

(Continued from vol. xix., p. 757.)

PLANTS WHICH ARE TOO TENDER FOR STOOLING .-Many plants introduced from Japan, China, and the Southern States of America, it is not safe to stool in the open; and for these a bed must be made in a pit, where the lights may be put on when necessary. The grand evergreen Magnolia grandiflora, Exmouth var., is one of these, but if one has a good plant against a wall, it may be layered there by using some of the temporary platforms, or bracket-rings. Merely fill some 48-sized pots with peaty soil and sand, and tonguo some small laterals, bend them into the pots, and secure them by passing a piece of thin tar-twine through the hole in the pot, and then looping it round the layer, pass it through the pot again, and secure to a branch of the Magnolia, or to a cross-peg at the hottom of the pot. The chief danger under this method is drought, as unless there is regular inspection, and watering the soil in the pots, exposed to the drying air and sunheat, gets baked, and the layer will not root into it. If you can, therefore, make a stool in a cold pit for Magnolia, Clothra arborea, Ceanothus, and Passiflora of rorts, and some of the tender Ivies, as Algeriensis

variegata, it is much the best method by which to increase them. The various Gorses (Ulex), as the double form of the common "Whin," the upright Irish, or the dumose Spanish variety, are best layered in the open. A simple plan for the last-named is to fork up the soil around a plant in the shrubbery, to enrich it with short dung, and add a little sand in which to peg down the outer branches of the Gorse; then pile soil on around, treading down firmly; this is alse a rough-and-ready method for layering Border Pinks.

DAPHNES.

One of the sweet-scented Daphne species is D. Cneorum. This is naturally a weak wiry-growing shrub, well adapted for the margins of beds of American plants. It is easily increased (and one cannot well have too much of it) by making the soil around an established plant rich and light, then tongueing the repent branches, and layering them into the soil, using wire layering pegs, or even large hairpins, to retain the shoots in position. Put down in the early spring they will have rooted freely by the next, and may then be lifted and put in the shade, and finally planted where required in the autumn. Pot a few of the plants in a peaty soil, and grow them on to decorate the conservatory in the spring, where their fragrance cannot fail to be grateful. Daphne indica, and also the more vigorous white form, may be propagated from layers, though I have advised the former to be grafted inside on Daphne laureola or Spurge Laurel or Daphne pontica.

HYDRANGEAS.

The grand Japanese Hydrangea paniculata grandiflora, should be planted at the bottom of a hollow or basin, so that at the flowering period it may have a good supply of liquid manure. Nover shall I forget my esteemed friend, Louis Van Houtte pere, taking me to see his plant of this lovely flowering shrub at Ghent. It was planted in the centre of a basin-like pit, near to one of the ingeniously-raised water-eisterns, and at the time I saw it, it bore at least one hundred large terminal panicles of its pure white barren flowers. A plant closely allied to this is Schizophragma hydrangeoides, a kind of creeping Hydrangea, with small panicles of flowers; this only needs pegging down ou to moist peaty soil to root at every node, and, like Daphne Cneorum, is useful to edge Rhododendron beds.

Roses.

I have already called attention to the troubles and vexatiou arising from the use of Manetti-grafted, or even budded, Roses, and advocated own-rooted plants. Layering is a ready means to propagate Roses, and it may be dene without forming a special "steel," hy simply bending down, tongueing, and layering the ripened loug shoots which are always produced in abundance by both Tea, Noisette, and H.P. Roses in beds. A class of Roses somewhat neglected now (not catalogued among show Roses by the National Rose Society) is that including the Moss and hybrid China varieties. These are best propagated by layering, while such lovely denizens of the court of Queen Rose as Coupe d'Hébé, Brennus, Charles Lawson, all layer freely, and do much better on their own roots. China Roses treated thus may be grown in beds and layered down, forming in a short time exceedingly handsome and fragrant additions to the flower garden.

CONIFERS.

Among the Couifers, the Arbor-vitæ (Thujas), Cupressus, Juniperus, Taxus, and Thujopsis can all be layered with advantage; but the Japan Cedars (Retinosporas) are the most easily increased by this simple means: Select a few strong growths at the base of your plant, say, R. squarrosa, and take off all the small laterals between the leading shoot and the bole of the shrub, and peg down on to the soil with some wooden pegs or zinc layering-pegs; water copiously, and then heap over the selected shoots some light prepared soil, merely leaving the growing points exposed to the air and light. Within twelve months these will be found to have made an abundance of fine fibrous roots, and in the autumn they

may be cut from the parent plant, and put in a sheltered spot, from which next year they may be moved, and used in the parternes for winter bedding.

MISCELLANEOUS SHRUBS.

It hardly needs telling that all shrubs are amenable to this method of propagation, but it is not advisable to layer any but such as will not propagate freely by cuttings. I will enumerate a few of these, and note any special treatment where it is needful.

The exquisitely-coloured Japanese Maples, varieties of palmatum and dissectum, should have a little box-like erection built round them; this should be filled with good light soil, and the shoots tongued and pegged down into it in the autumn, and removed the following autumn, when they will be found well-rooted. The Fern-leaved Alder, A. imperialis asplenifolia, may be layered thus at any time.

The Arbutus, though it grafts freely, may yet be layered, the scarlet flowering variety of A. unedo, a very desirable addition to a shrubbery, and Rollison's flue variety are propagated thus. Ancubas, if layered, soon make pretty little plants, which, being well berried by artificial fecundation, are very ornamental. A. salicifolia and viridis are the two best, as they display their coral-red fruits better than other varieties.

Among flowering shrubs the so-called Ghent Azaleas and the Japanese A. mollis may be layered easily and quickly, and should be put down as soon as they complete their growth on a light and peaty compost, which should never be suffered to get dry.

Among evergreeu flowering shrubs the Berberids are very attractive. Most of them are easily grown from seed, but some of the best are only reliable from layers, as they so easily hybridise and sport. B. fascicularis, a form of the Holly-leaved variety, must be layered, and the exceedingly graceful repent hybrid stenophylla should be thus increased also.

The singular, but pretty, Enddleia, with its globose heads of flowers, and its botanical relative named after Dr. Lindley, which no one would take to be of the same genus, need layering for stock. For all the Ceanethus tribe a cold pit is necessary. Such well-known kinds as C. azureus, and the lovely large panicled variety raised by my friend Emile Lemoine, of Nancy, named Gloire de Versailles, making long flexible shoots, are easily manipulated; but the close-growing, small-leaved varieties, C. papilionaceus and C. rigidus, need careful handling, and take longer to root—indeed, they are easier raised from cuttings under a bell-glass, and will be referred to with other subjects later on.

Taking an intermediate position between ornamental shrubs and useful fruit-trees, the various Nuts are propagated in nurseries from stools laid down in February or March. The two most nseful are the purple-leaved Filbert and the cut-leaved Cob, both of which fruit freely when they attain to sufficient size and age.

Deutzia gracilis, so much used for early forcing, is increased by division of the roots and by cuttings; but the erect-growing D. scabra and D. erenata are better when layered.

The Oleasters (Elwagnus), most useful plants to cover unsightly walls or fences, are generally increased by layers; the best are the silver and gold variegated forms of Elwagnus reflexa. The star-like scales from the back of the leaf of this plaut are pretty objects for the microscope, mounted in Cauada balsain, or even put up dry.

The Dyer's Broom (Geuista tinctoria) makes excellent rock-plants, or marginal plants in the shrubbery, more especially the double form, and layers with great facility. A more difficult subject is the Snowdrop tree, Halesia, but this is best put down when in full foliage, and shaded by a few Fir branches. All the handsome Magnolias of a deciduous habit, as M. Lenne, M. acuminata, M. purpurea, are best layered; as are the Mock Oranges (Philadelphus), the finest being one known as P. speciosissimus; and the singular Hop-tree, Ptelea trifoliata. The Venetian Sumach Rhus Cotinus, and Chionanthus virginiana may also be layered. The former makes a useful stool, and with

the Japan Skimmias, should be treated to a peaty bed, and kept very moist, when they will reot freely frem layers. The shrubby Spiræas, especially S. grandiflora (now called Exochorda) must be layered into light soil; while the Bladder nuts (Staphylea), especially the one grown for forcing, viz., S. colchica, are best layered into plunged pots, and the seil covered with moss, or mulching to keep it meist. Viburuums both evergreen as in Laurustinus, and deciduous as V. plicatum, should be layered in the autumn. Experience,

Obituary.

DEATH OF THE INVENTOR OF MEDICATED GARDEN SHREDS .- William Lerro's name will live in the memory of those who identify the individual and his work, which is perpetuated in the firm which has centiqued that work since he retired from business in 1892. Mr. Lerro, who only enjoyed his retirement for about four years, recently passed away at Worthing at the age of 71. Mr. Lerro contrived a shred for securing fruit trees, Vines, and creepers against walls, &c., that would replace the old slips of woollen cloth, leather, list, &c., which form a harbour for insects, some of which are detrimental to plantssomething that would repel instead of entice them. The Medicated Garden Shreds, or "Dean's Shreds," as known to many, proved their value in this respect, and Mr. Lerro was flattered by their use in royal and other large gardens. Mr. Lerre, when freed from the auxiety of the manufacturer, employed his leisure in acts of benevolence, and in alleviating the sufferings of his fellow creatures.

MRS. G. W. CUMMINS.—Those of our readers who are acquainted with the esteemed gardener to Mr. A. H. Smee, The Grange, Wallington, Surrey, will sympathise with him in his bereavement. Mrs. Cummins passed away somewhat suddenly on June 20.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending June 27, is furnished from the Meteorological Office :-

"The weather was at first fine over the southern and eaetern parts of the Kingdom, but unsettled in the west and north, with frequent, and in some cases, heavy falls of rain. Later on showery weather became general, and on the 24th thunderstorms or thunder only were reported in many parts of Eogland, as well as in isolated parts of Ireland and Scot-land. Towards the close of the week an improvement was reported in most districts.

The temperature agreed very closely with the average in the 'Wheat Producing' districts, and also in 'England, N.W., but was slightly above the normal over the western parte of the Kingdom generally. The highest readings occurred mostly on the 27th, when the thermometer rose to 75° and upwards in nearly all the English districts, as well as in 'Scotland, E. and Ireland, N., and to 82° in 'England, S.W.' In 'England, N.W. and the Channel Islands' it did not exceed 71. The lowest readings were observed on various dates in the different districts, but were mostly various dates in the different districts, but were mostly either on the 22nd or 23nd, or on the 26th or 27th; in the 'Channel Islands' the thernometer did not go below 48', but in most other districts it fell to betw en 41' and 44', in 'Scotland, E.,' to 30', and in 'Scotland, W.,' to 38'
'The rainfall was less than the mean in all districts, excepting the 'Midland Counties, England, N.W., and Ireland, N.V.,' where there was a slight excess.

"The bright suashine was very deficient in 'Ireland and Scotland, N.,' and slightly below the mean in 'England, E.' In all other districts the amount was in excess of the normal, the difference in 'England, S.W. and the 'Channel Islands' hoing large. The percentage of the possible duration ranged from 65 in the 'Channel Islands,' and 59 in 'England, 8 W.,' to 18 in 'Scotland, N.,' and 17 in 'Ireland, N.,'

MARKETS.

COVENT GARDEN, JULY 2.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmed, who revise the first, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any purtuellar day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supplyin the market, and the demand; and they may the tuate, not only from day to day, but often several times in one day. Eq. [

SEEDS

LONDON: July 1. - Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's seed market, as usual on Midsummer Wednesdays, presented an inanimate appearance: indeed, stagnation all round is just now the prevailing note. Some small sowing orders still drop in for Tares, Mustard, &c There is no change in Raposeed. America, it is worth noting, continues to take Trifolium from England. Some choice Spanish Lentils are now offering on tempting terms. Peas and Haricots are naturally at present neglected. As regards Canary seed, a further fall roully looks now impossible. Hemp seed is dull. Other articles at this inverse period call for no comment

FRUIT AND VEGET ABLES.

FARRINGDON: July 2. — Quotations: — Cabbage, 5s. per tally; Peas, 3s. per bushel; Broad Beans, 2s. do.; Marrows, 4s. per dozen bunches; Turnips, 4s. per dozen; Carrots, 4s. per dozen bunches; Turnips, do.; spring Ogious, 2c. 6d. per dozen bunches; Radishes, 1s. 6d. do.; Lettuce, 1s. per score; Mint, 2s. per dozen bunches; Parsley, do.; Strawherries, 2s. 6d. per peck; Red Currants, 6s. per half-bushel; Black do., 7c. do.; Cherries, White-hearts, 6s. tid. do.; do., Black, 4s to 5s. 6d. do.; Raspberries, 5s. per dozen punnets; Gooseberries, green, 2s. 6d. per half-bushel; ripe do., 3s. 5d. do.; Tourdos, English, 4s. 6d. per dozen 1b.; Pine-apples, 2s. each (5 to 6 lb.).

CORN.

Averages.—Official statement of the average prices of British Corn, imperial measure (qr.) for the week ending June 27, and for the corresponding period last year:—1896: Wheat, 21s. 10d.; Barley, 19s. 3d.; Oats, 14s. 10d. 1805: Wheat, 26s. 1d.; Barley, 20s. 3d.; and Oats, 16c. 7d.

POTATOS.

BOROUGH: June 30.-Quotations: Old. 15s. to 40s. per tou; New, 5s. to 7s. 6d. per cwt.

SPITALFIELDS: June 30.—Quotations:—Oli; High-lands, 32s. to 40s.; Black-lands, 20s. to 30s. per ton; Hebrous, £6 to £6 10s.; Sutton's Regents. £6 to £7; Jersey Kidneys, £6 to £6 16s.; do., Flukes, £6 10s. to £7; do., Rounds, £5 10s. to £6 per ton.

STRATFORD: June 30. - Quotations: - English, 6s. 6d.; Jersey Kidneys, 6s to 7s.; do. Flukes, 6s. 6d. to 7s. 6d.; Cherbourg, 6s. to 6c.; St. Malo Flukes, 6s. 6d. to 7s. per cwt Old: light-soil Bruces, 15s. to 25s.; Magnums, 15s. to

FARRISDON: July 2. — Quotations: — New: Bedford's Monarch, £6 to £7; Dunbar do., Lincolns, £6 to £6 104; blackland, £6; Jersey Myatts, £6 to £6 6s.; do., Flukes, £6 6c to £7 per ton.

LONDON MURKET AVERAGES: July 1. — Early Regents, 6s. to 7s.; Snowdrops, 6s to 7s.; Hebrons, 6s, to 7s.; Jersey, 6s. to 5s.; St. Malo, 4s. 6d. to 5s. 6d.; Cherbourg, 5s. to 6s. cwt. Old: Dunbar Main Crop and Bruces, 30s, to 40s.

HAY.

Averages.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 65s. to 90s.; inferior, 38s. to 60s.; Hay, best, 60s. to 57s.; inferior, 30s. to 55s.; mixture, 60s. to 54s.; and straw, 20s. to 40s. per load.

NOTICES TO CORRESPONDENTS.

- BOOKS ENTOMOLOGY: Margaret. The last edition (second) of the Manual of Injurious Insects, and Methods of Prevention, by Eleanor A. Ormerod (Simpkin, Marshall, Hamilton, Kent & Co., London),
- Books: Jusper. The Garden Calendar, by T. W. Sauders, published by Hamilton, Adams & Co., l'aternoster Row, price 2s. 6d. If you require a still cheaper work, The Cottagers' Calendar, published at this office, price 3d., should be obtained. It is an admirable manual of its kind.
- DRESSED HARDING: Mushroom. Apply to the Horticultural sundriesmen iu a large way of business, or turpaulin-makers.
- GLADIOLUS THE BRIDE: R. M. Some injury has probably befallen the parent-bulb, destroying the flower, and resulting in the formation of numerous small bulbs. These will probably flower next year.
- KEW: A Lover of Kew. On application to any of the gate porters, you will be furnished with hand lists (about a dozen) of the plants grown in the various departments of the garden, and of the contents of the various museums, and the North Gallery. A description of Kew as it then was, is to be found in our issue for August 5, 1876.
- MUSHROOM CULTURE: S. H. J. Like the correspondent you mention, we should advise you to go to work tentatively, and half an acre of laud would suffice for a beginning. It is not alone sufficient for you to produce Mushrooms, you must find castomers for the same. Obtain a name, if you can, as a grower; in fact, get well known in the markets, and endeavour to come into direct relations with retail buyers through the post, and by taking advantage of the recent introduction of the small parcels tariff on some of the railways. A Mush-room cultivator is no more removed from the risks attendant on all business pursuits than other men; but as at the present time the cultivation of the esculent lags behind demand, there must be money in it for some years to come, even should the prices obtainable in summer and winter fall to one-half of those that are usual. Obtain the issue of the Gardeners' Chronicle for January 11 of this year, and you will see some of your queries answered by a noted grower. Do not trust too implicitly the estimates of the income to be derived from Musbroom culture framed by those who have not been growers for market.
- Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number. — Hortus. Dondrobium chrysunthum.—N. C. 4, Pteris hastata; 5, Pteris following number. — Hortus. Dendrobium chrysunthum.— N. C. 4, Pteris hastara; 5, Pteris argyrau.— D. B., Rappart. A very fine variety of lins Kampfen.— Weeds. The nail-galls on the leaf of Lime-tree are caused by a mite—Phytopus thiae. The blue flower is Lathyrus cyaneus.— G. T. Polygonum sachalinense (Polygonaceæ), North-east Siberia, &c.—W. C. Habenaria bifolia. W. J. P. 1, Galega officinalis; 2, Lychnis chalce-

donica; 3, Abies concolor; 4, Rhododendron ferrugineum; 5, Sedum rapestre.—Enquirer. 1, Campanula persicifolia; 2, Campanula, specimen insufficient; 3, Carduus, which we cannot name without the leaf; 4. Antennaria tomentosa; 5, Gladiolus illyricas; 6, Valeriana officinalis.—E. H. Cistus ladaniferus.—A. B. Saxifraga longifolia.—F. F. S. We are sorry to be unable to name your Pomegranate. The French cultivate many varieties that are not known here.—A. B. 1, No flowers—apparently Tanacetum vulgare; 2, Taxodium distichum; 3, Reseda luteola; 4, Spiræa ariæfolia; 5, Deutzia crenata, douhle-flowered; 6, Spiræa chamædrifolia; 7, Farfugium grande.—G. W. 1, Anthericum lineare variegatum; 2, Colutea arborescens; 3, Sedum tartuosum var.; 4, 5, Roses—send to some nurseryman.—G. F. B. 1, Galega officinalis alba; 2, Tradescantia virginica; 3, Veronica spicata; 4, Sidalcea malvæflora; 5 Levisticum officinale, Lovage; 6, Daphne Mezereum. - G. H. Lælia crispa, generally but erroneously called in gardens Cattleya crispa.—A. B. Crassula coccinea, unusually rich scarlet-crimson.—D. M. II'. Probably Sambucus ebulus, but you enclosed a devouring caterpillar, who left but little of the leaf, but many traces of bis voracity .- W. P. 1, Hyoseyamus niger, Henbane; 2, Impatiens, perhaps I. Sultani. Why send such scraps! you do not realise what they are like when we receive them.-Thorp. 1, Collomia coccinea; 2, not recognised; 3, trum viride; 4, Ranunculus aconitifolius.—6. T. B. Lathyrus cyaneus.

PEAR: F. G. G. The common slug-worm, very destructive. Selandria atra.

PEAR FLOWERING ON THE WOOD OF THE YEAR: C. B. This is not a very unusual occurrence, particularly in some varieties, as Napoleon. Λ similar thing happens in the Laburnum and other trees which normally produce their flowers on spurs.

South Africa: Amor Patria. If you enquire at the Emigration Office, Broadway, Westminster, they will furnish you with the kind of information that

Specimens and Books. W. H. P. If you live in the vicinity of a botanic garden you can obtain specimens. Text-books are legion, very few of them deal with the properties of plants. Henfrey's Elementary Course (Van Voorst) is the fullest in this department. Have you asked at the Cambridge or Oxford Local

TARRED STAGING: A. E. H. We do not know what you can do to remove the tar cheaply. Why not consult a builder about the matter :

TOMATOS: A. E. H. You will find farmyard drainings in a diluted form a good manure, and failing those, Peruvian guano, sprinkled on the soil in small quantities, or mixed with the water used for watering, quite safe in use. Sheep, pigeons, and fowls-droppings are good for the plants. These should be partially dried, so that they will readily pass through a 1-inch or finer-meshed sieve. If artificials must be used, use nitrate of soda, superphospate of lime, and potash.

TOMATOS WITH DISEASED FRUITS: T. Martin. They are affected with Cladosporium lycopersici (the black spot). There is no remedy when a fruit is attacked by this species of fungus, but we would recommend a mild form of the Bordeaux Mixture to be used on the plants whilst there are no ripening fruits on them, and the gathering and destruction by burning of every affected fruit forthwith.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each

Notice to Advertisers.—In many instances
Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated. POSTAL ORDERS .- To Advertisers, Subscribers,

and Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to II. G. Cove, as, unless the number of a Postal Order is known, and it has been mude payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B .- The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER. Publishing Office and Office for Advertisements.

41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. Cove.

Subscribers who experience any difficulty in obtaining their copies regularly, are particu-larly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SALES BY AUCTION.

Friday Next, July 17.

TESSRS. PR') THEROE AND MORRIS have received instructions from Messrs. F. Sander & Co., St. Albans, to SELL by AUCTION, at their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, July 17, at half-past 12 o'Clock precisely, a consignment of

July 17, at half-past 12 o'Clock precisely, a consignment of RENANTHERA IMSCHOOTIANA —A dwarf, compact growing, new species, with immense panicles of large, brilliant, orange-vermilion blossoms. The gem of the genus now introduced for the second time by us, only a few plants to hand, and ull are offered without any reserve. The flowers are produced on plants 6 inches high The inforescence is a bouquet of brilliant vermilion blossoms. As many as sixty blooms are borne on a spike, the large size of the of the panicles and flowers, and the immense number produced by the plant being totally out of proportion to its size. The plant covers itself with its glorious masses of blossom. The habit is dwarf, and the oulture simple. There is no doubt, but that it is the most charming of the genus. An Award of Merit was accorded it by the Orchid Committee of the Royal Horticultural Society, June 11, 1895.

A large consignment, in splendid order, of

A large consignment, in spiendin order, of CYMBIDIUM LOWIANUM VAR., from the same district whence came the plants offered in our Sale of July 3. The district is almost inaccessible, and great difficulty was experienced in getting the plants to the coast. Although never yet obtained from Upper Burmah, we believe C. Hookerianum is among the plants offered.

A PHAIUS SPECIES from Burmah, probably a form of P. Sanderianus

A VANDA SPECIES (Roxburghii?).—The plants bear a strong resemblance to V. Roxburghii, and they are probably a form of that species, but no information has been received regarding them.

A splendid assortment of CALANTHE HYBRIDS, comprising

A splendid assortment of CALANTHE ATDAMES, comprising the most beautiful and latest raised:—
CALANTHE WM. MURBAY.—Flowers white and crimson.

, HAROLD.—Rosy-carmine and crimson.

, CLIVE.—Rosy-carmine, orange-ochre throat, sepals shading into white.

, SANDHURSTIANA.—A strong-growing, most richly-

coloured form.
VICTORIA REGINA.-Rosy-pink petals and sepals, lip

VICTORIA REGINA.—Rosy-pink petals and sepals, lip almost white.

COOKSONII.—A splendid snowy-white-flowered hybrid.

BEYAN.—Flowers pure white, with an intense black-purple-maroon throat.

NIVALIS, pure white flowers, with a yellow disc, produced in great profusion.

REGNIERII, sepals and petals white, labellum rosy-pink.

VESTITA RUBRO-OOULATA, a splendid variety, flowers white, the lip having a crimson blotch in centre.

centre.

LUTEO-OCULATA, SANDER'S VAR.—The grandest variety of luteo-oculata.

RUBENS ALBA.—A pure white variety.

LAUCHEANA.—A very distinct cross, flowers of a distinct blue colour.

SYLVATICA.—A very rare species.

VERATRIFOLIA. — A popular well-known species.

Calanthes are unequalled for winter decoration, and the foregoing hybrids are the finest subjects for that nurgose. nurnose

DENDROBIUM NOBILE, LANG TANG VARIETY.—From this district a host of splendid forms have emanated, and no doubt the present consigument will add to the number. Also rare, interesting, curious, fascinating, weird, mimical, attractive, exquisite, delightful, piquant, remarkable, charming and beautiful Orchids.

charming and beautiful Orchids.
THUNIA BENSONLE, DENDROBIUM CLAVATUM.
DENDROBIUM FORMOSUM OIGANTEUM,—A wonderfully free-flowering Dendrobe, admirably adapted for exhibition purposes, and most useful to the florist.
DENDROBIUM DALHOUSIEANUM, D. CHRYSOTONUM, D. SANGUINOLENTUM, D. INPUNDIBULUM, D. FARMERI, D. FIMERIATUM*D, THYRSIFLORUM, D. DENSIFLORUM.

number of extra fine well-leaved short plants of VANDA CERULEA, a CELOGYNE SPECIES from Upper Burmab, &c.
On view morning of Sale, and Catalogues had.

SATURDAY, JULY 11, 1896.

ROSES AND ROSE SHOWS.

DARTICULAR interest attaches to the exhibitions of Roses during the present season, from the extraordinary character of the weather during the past few months. Rarely has there been a season when the prospects, from a rosarian's point of viow, have fluctuated from week to week, as during the present year. The winter was also a remarkable one, and Rose-lovers had occasion to congratulate each other at its close upon the excellent condition of their plants, fow of which had been injured in the least. The season was commenced therefore under very encouraging conditions, directly opposed to those prevalent at the same date in 1895. The spring had hardly dawned upon us, before these favourable circumstances were superseded by others far less pleasing. The drought which has proved to be a long one had commenced, and its deleterious effect was increased by the cold, dry, eastern winds that prevailed for weeks. It was only too evident that against this combination of evils Roses could not combat without very serious loss, and anxiety quickly replaced the feeling of satisfaction so general previously. Blight was soon the consequence of the drought and east winds, and when at last the chilling winds decreased, there followed exceedingly bright sunshine, which the Roses, with their roots in dry soil, and their vitality already weakened, could not enjoy, and by which their ultimate chance of blooming well was increasingly decreased. For the greater part of the time latterly, there has been little in the Rose garden to cheer an amateur on the look-out for blooms worthy of the exhibition-table, and that he might hope would possibly be rewarded by a National Society's Silver Medal. The shows have been less good than in many previous seasons, but to those who have been engaged to even a limited extent in their cultivation this has been no matter for surprise.

The Reading exhibition has been already described in these pages, and is the subject of further remarks below.

At the Crystal Palace on Saturday last, the display was not equal in quality or extent to the exhibition held there in 1895. Growers were less able to exhibit well on this occasion than at Reading; but what was the southern growers' misfortune was also the northern growers' opportunity to excel, and Messrs. Harkness & Sons succeeded in capturing the trophy, and the north secured other good classes and distinctions. Nevertheless, the 2nd prize in the nurserymen's large class was won by Mr. Frank Cant, Colchester, albeit there were other collections from the north, candidates for the prize.

Generally the Teas were much below average size, and very few good blooms were staged. It was difficult to find a Rose in this section

among the nurserymen's classes worthy of the Society's Silver Medal, and the bloom of Innocente Pirola, to which the medal was eventually awarded, was comparatively a poor one. Roses that have done well such a season as the present are good ones for planting against a similarly unfortunate year, and in the report of the show, the best blooms in all the classes are indicated.

Other Rose shows have been numerous. The Roses in connection with the Wolverhampton Floral Fête were better than we had expected to see them, but less good and less numerous than last year. The class for seventy-two blooms was won by the firm who secured the trophy at the Crystal Palace. The Rev. J. H. Pemberton has been remarkably successful at most shows, and at Wolverhampton took all the best prizes in the amateurs' classes. At this show there were about 1900 blooms staged. The National Society's exhibition at Ulverston and a few other northern Rose shows have still to be held.

NATIONAL ROSE, CRYSTAL PALACE. NURSERYMEN'S CLASSES.

THE CHAMPION TROPHY AND GOLD MEDAL were, as usual' won and lost with the 1st prize for seventy-two blooms distinct. This year the trophy will be taken to Bedale, the winner of the class being Messrs, Harkness & Sons, Bedale and Hitchin. The collection, taken collectively, exhibited as good quality as we have seen in a large class this senson. The flowers were:—Back row: Ulrich Brunner (large and handsome), François Michelon, Comtesse d'Oxford, Marchioness of Dufferin, Captain Hayward, Lady Mary Fitz-william Dr. Andry, Mrs. Jas. Laing, Etienne Levet, Duchesse de Vallambrosa, Chus. Lefebvre, Caroline Kuster, Madame J. Bomaire (?., Star of Waltham, Alfred Colomb, Her Mejesty, Gustave Piganeau, Caroline Testont, Jn., Stuart Mill excellent), Paul Neyron, Madame Eugénie Verdier, Exposition de Brie, Baroness Rothschild, Horace Vernet (good, but passing and row: Séu teur Vaisse, La France, Maréchal Niel, Earl of Dufferin, Niphetos, Frince Arthur, Madame de Watteville, Duke of Edinburgh (good), Mrs. Sharman Crawford, Suzanne de Rodocanachi, Catherine Mermet, Edonard André, Innocente de Kodocanachi, Catherine Mermet, Edouard André, Innocente Pirola, Madame Hanssman, Madame Hoste, Madame Victor Verdier, Madame G. Luizet, Comte de Raimbaud, The Bride, Fisher Holmes, Comtesse de Nadaillac, A. K. Williams, Madame Cusin (very fine), Doe de Roban. Front row: Marie Verdier, Mrs. W. J. Grunt, Comtesse de Ludre, Pride of Waltham, Duke of Wellington, Marie Baumann, E. Y. Teas, Oneom of Opening, Narie M. J. Perica. Queen of Queens, Marie Rady, Ernest Metz, Duke of Fife, Princess Beatrice, Pride of Reigate (2004), Helen Keller, Victor Hugo, Duchesse de Morny (good), Theiri Kener, Victor Hugo, Duchesse de Morny (good), Charles Darwin, Marchioness of Dufferin, Pierre Notting, Merveille de Lyon, Marchioness of Dufferin, Pierre Notting, Merveille de Lyon, Lady Sheffield, Souvenir d'un Ami, Duc d'Orleans, and Augustus Guineisseau, Messrs, Frank Cant & Co., Colchester, who only just missed the trophy last year by two points, were again 2nd on this occasion. The following were pretty blooms of very commendable msrit: -Victor Hugo, Chas. Darwin, Earl of Dufferin, Madame Chas. Crapelet, a pink sport from Suzanne Pedecacanic but unpersade Exposition de Pais Rodocanachi, but unnamed; Exposition de Brie, Kaiserin Augusta Victoria, Catherine Mermet, and Reynolds Hole: Mr. B. R CANT, Colchester, was 3rd There were four competitors.

Forty distinct Ross (teeldes).—Messes. Varkness & Sons were also the winners of this class, with a comparatively good stand. The varieties which helped most were Gustave Piganeau, Suzume de Rodocanachi, Her Majesty, Duke of Wellington, Edward Andry, Marie Baumaun, Captain Hayward, Helen Keller, A. H. Williams, Fisher Holmes, and Marchioness of Dufferin. Mr B. R. Cant took 2nd place with a collection but little inferior, and Messes. F Cant & Co. were 3rd. There appeared to be no other competitors.

Marchioness of Dufferin. Air B. R. Cant took 2nd place with a collection but little inferior, and Messrs. F CANT & Co. were 3rd. There appeared to be no other competitors.

Forty-eight distinct, single trasses—In this class the winners were Messes. D. PRIOR & Son. Colchester, and the varieties staged were:—Back row: A K. Williams, Mrs. Jno Laing (good., Ulrich Brunner, White Lady, Duchesse de Morny (good.), Horace Vernet, Her Messy, Primee Arthur, Marie Verdier, Earl of Dufferin (good.), Marchioness of Dufferin, Marie Baumann, Marie Funger, Altred Colomb, François Michelon, and Alphense Soupert Centre row: Merveille de Lyon, Baron Adolphe Rothschild (good.), Eugénie Verdier, Ahel Carrière, La France, E Y. Teas, Duke of Edmburgh (good.), Pride of Walthur, Dupay Jamain, Lady M. Fitzwilliam, Louis Van Hentte, Margaret Dickson, Captain Hayward, Heinrich Schultheiss, and Charles Darwin—Front row: Suzume Marie Rodocamechi, Comte de Rainband, Silver Queen, Reynolds Hole chad.), Duke of Fife, Pisher Holmes, Mrs. W. J. Grant, Exposition de Brie (bad.), Auguste Rugol ard, Due de Rohan, Borness Rothschild, Victor Hugo, Etceme L. vet, Xavier Ohto, Souvenir de La Malmaison, and Star of Walthur. Of the four other exhibit resting 2nd place wis taken by Messes. J. Braker L. & C., Cambridge, The blooms wate small, some of them, however, fre, h and bright; Srd, G. W. H. Euger, Peterborough.

Twenty-four distinct Roses.—The 1st prize in this class went to Slough, the winner being Mr. Chas. Turner of the Royal Nurseries. The quality of the exhibit was good, the only failing being in regard to the size of bloom. The varieties were Marie Verdier, Xavier Oliho, Her Majesty, Earl of Dufferin, Mrs. John Laing (good), Beauty of Waltham (good), Marchioness of Dufferin, Alfred Colomb. 2nd row: Duke of Fife, Black Prince, Gabrielle Luizet, E. V. Teas, G. Piganeau, Reynolds Hole, Heinrich Schultheiss, Ulrich Brunner, Chas. Darwin, Murie Baumann, Mrs. Harkness, Victor Hugo, Dr. Andry, Prule of Reigate, Maurice Bernardin, and The Bride. 2nd, Messrs. Jas. Townsend & Suns, Lower Broadheath, Worcester: Alfred Colomb, Prince Arthur, and Niphetos, were good; Mr. John Mattock, Oxford, was 3rd. There were four other competitors.

Twenty-jour distinct Trebles,—Messrs, Prior & Son, won with a collection of moderate quality; Messrs, G. & W. H. Burch were and; and Messrs, Las Toursey, & Son, and

with a concernor inforcerate quality: Messes, G. & w. H.
Berech were 2nd; and Messes, Jas. Townsend & Sons, 3nd.

Twelve distinct Ross of varieties, reised by Messes, A. Dickson
& Sons, Nectoonacels.—The Dickson Challenge Cup, offered
by the firm for the best exhibit in this class was won by
Messes, Frank Cunt & Co. The varieties were Marchioness
of Dufferin (over-blown), Mrs. R. G. Sharman Crawford,
Margaret Dickson (ever-blown), Earl of Dufferin, Lady Helen
Stewart (good), Helen Keller, Marchioness of Downshire,
Lady Arthur Hill, Jeannie Dickson, Caroline d'Arden, and
T. W. Girdlestone. The quality of this collection was only

THE RIV. H. H. D'OMBRAIN.
(Hou, Sec. and Father of the National Rose Society.)

moderate. Mr. B. R. Cant was 2nd; and Messis, D. & W. Chott, Dundee, were 3rd,

Eighten distinct Roses (English or Scotch raised).—Curiously

Eighten distinct Roses (English or Scotch raised).—Curiously the list prize was won by Miessis. ALEX. Dierson & Sons, Newtownerds, co. Down, though Irish Roses were not allowed to be shown, and one exhibitor was disquadified for including some. None of Messis, I ficksons' blooms were of varieties raised in their own country, however. They were Mrs. Juo. Luing, Captain Hayward (good), Her Majesty, Iride of Waltham, Spenser, Star of Waltham, Mrs. Jowatt, Mrs. Geo. Dickson, Sultain of Zanzibar, Meden, Prince Arthur, Lady M rry Fitzwilliam, Olibo, Countess of Rosebery, Heinrich Schultheiss, Paul's Early Blush, Duchess of Albany, and Mrs. Paul; 3rd, Messers. Geo. Paul & Son, The Old Nurseras. Cheshunt.

TEA AND NOISETTE SECTION.

Trentaciour distinct Roses.—The 1st prize was taken by Messes D Prior & Soo, Celchester. The varieties were Back row: Ernest Metz, Innovente Pirola, Maman Coob t, Marie Van Houtte, Malanoe de Watteville, Edith Gifford, Comtesse de Nadrillac, The Bride (very good), Alba rosea, La Princess Vera, Niphetos, Utherine Mermet, Marabal Nad, Madame Casin (good), Caroline Kuster, Souveaurd om Adm, Corinna (good), Sonvenir d'Elise Vardon, Admn, Sorvenir de S. A. Prince, Luciole, Medea, Anna Olivier, and Francisca Kruger. The blooms were of moderate quality only, few of them being exceptional. Messes Frank Casta & Co. Col. chester, were 2nd, and had pretty specimens of Maman Cochet, Contresse de Natidlae, and Corinna; 3rd. Mosses, D. & W. Crotta, Dumbor.

Fightian Tensor Numerics, distinct.—In this class Mr. JNO. MATTOCK, Headington Numery, Oxford, was the victor. The best blooms in his stand were Catherine Mermet, The Bride,

Princess of Wales, Madame de Watteville, Souvenir de S. A. Prince, and Ethel Brownlow. 2nd, Messrs, J. Burrell & Co., Howe House Nurseries, Cambridge, the flowers were small in this stand, but some of them pretty; the best was Maman Coelet. 3rd, Messrs, Paul & Son, The Old Nurseries, Cheshunt. There were two other collections.

hunt. There were two other collections. Eighteen trebles, distinct.—Messus Frank Cant & Co. staged well in this class, and secured premier position. Their best trebles were Ernest Metz, The Bride, Madame Lambard, Maréchal Niel, Ethel Brownlow, Maman Coehet, Madame Cusin, and Madame Van Houtte. Mr. Jno, Matrock was a good 2nd, and the third place was taken by Messus, D. Prior & Son. There were two other collections.

GARDEN ROSES

Thorty-six hunches, distinct varieties.—Messrs. Pall & Son had very fine bunches arranged in good fashion. Most of the varieties included were in good condition, and the collection was well worthy of the 1st prize it won. Messrs. Geo. Coolino & Son, Bath, and Messrs. F. Cant & Co., who were and and 3rd respectively, also showed well.

Bighten broches, not fiver than three trusses to a broch.— Mr. Jno. Mattock was 1st, and Messrs. D. & W. Croll 2nd; 3rd, Messrs. Jas. Townsend & Sons. The bunches shown in this class were not so effectively staged as those noticed in the previous class.

Nuce brackes of Single-howered Roses.—Messrs. D. & W. Choll won in this class, but the nature of the flowers is much against their long preservation, and at mid-day they appeared very field. 2nd, Miss Mellish, Hodsock Priory, Worksop, Notts; Messrs. Pall & Son were 3rd.

Tectre benches of Ruses suitable for Button-holes.—Mr. J So.

Twitze benches of Ruses suitable for Button-holes.—Mr. Jno. MATTOCK won capitally bere, with the following varieties:—Madame de Watteville, Marie Van Houtte, Niphetos, Anna Olivier, W. A. Richardson, Ma Capucine, Comtesse de Nadaillae, Madame Hoste, Rubens, and The Bride; 2nd, Messrs, Jno. Townsend & Sons; and 3rd, Mr. Alfred Evans, Marston, near Oxford.

Display of Roses and Rose foliage.—The 1st prize was taken by Mr. Jno. Mattock, who exhibited bouquets and bunches over a black velvet ground with considerable effect. 2nd, Mr. Geo. Prince, with a half cone of black velvet supporting six rows of shelves. The Boses were in small glass vases, Messrs. Townsend & Sons were 3rd.

OPEN CLASSES,

Tretre bunches, distinct.—These bunches were to be composed of any H.P., H.T., or Tea or Noisettes. The 1st prize was taken by Messrs. PAUL & Sox, Cheshunt. The bunches were shown in earthenware bottles, with long stems and toliage attached. The varieties which appeared best were Alfred Colomb, Marie Van Houtte, Niphetes, Jeannie Dickson, and Suzanne de Rodocanachi; Mr. Geo. Mount was 2nd, with a good lot; and Mr. John Mattock 3rd.

Tredre trosses of H. T.'s in not free than nine varieties.

Twelve trasses of H. T.'s in not fixer than nine varieties.

Messes, A. Dierson & Sors won with the following varieties,

Conte Henri Rignon, Caroline Testont, La France (good),

Capt. Christy, Lady M. Fitzwilliam, and Kaiserin Augusta

Victoria, Mrs. W. J. Grant (good), Visconntess Folkestone,

and Marjorie; 2nd, Messes, D. & W. Croll; 3rd, Frank

Cant & Co.

Tirelet single tenses of any pollow Rose,—Mr. Jno. Maddock won this class with very fair blooms of Comtesse de Nadaillae; Messes. Frank Cant & Co. were 2nd, showing Madame Hoste; and Mr. Geo. Mount was equal 2nd with Marie van Hontte.

Twelve simple tresses of any white Rose.—Messis. A. Dickson & Sons were 1st with blooms of Marchioness of Londonderry of moderate quality; Messis. Harkness & Son were 2nd with The Bride; 2rd, Messis. D. Prior & Son with Niphetos.

Twelve single trusses of any crimson Rose.—Captain Hayward was placed I t in this class, this Rose being shown well by Messrs. A. Dickson & Sons; Messrs. Robt. Mack & Son, Catterick, Yorks, were 2nd with A. K. Williams; and Mr. Gro. Mount 3rd. There were shout furthern arking trusters arking the state of the state o

Geo. Mount 3rd. There were about fourteen exhibitors.

There is single trusses of any dark velvely Rose.—Messrs.
F. Cant & Co. were 1st with Hornee Vernet; Mr. Geo.
Mount 2nd with Fisher Holmes; and Mr. R. R. Cant 3rd with the same variety.

with the same variety.

The lee single trieses of any light (other than white) Rose.—

Mr. Geo. Mount was 1st, with Mrs. Ino. Laing. The same variety, shown by Messrs. D. & W. Choll, was 2nd; and Messrs, Robert Mack & Son 3rd. There were about fifteen stands.

Twelve simple trasses of any Tea or Naisette.—Mr. J.Ko. Mattock won this class with Catherine M. rinet; Messrs. Harkness & Son. were 2nd with Madaine Cusin; and Mr. B. R. Cart 3rd with Madaine Watteville. Twelve single trasses of any new Rea.—Messrs. Dickson &

Twelve single transic of any new Rear —Messis. Dicason & Sons, Newtownards, Ireland, were list with some fair blooms of Mrs. R. G. Sharman Crawford, a rose that was probably staged as frequently as any throughout the exhibition Messis. I know & Son, Colchester, 3rd with Mammi Cochet. I feel is distinct transics of any new Rose, —Messis. Dickson & Sons equin second, several of the varieties being of their own retrieval.

I will e distinct tresses of may new Rose, "Messes. D.C. RSON & SONS nguin scorol, several of the varieties being of their own ruising and not yet in commerce. They were Murchioness of Londonderry, Lody M. Beanclere, B. Shandon, Leinster (somewhat after Helen Keller, Manie (2), Miss. E. Richardson (a beautiful light Rose of Marjorie shade), Mrs. W. J. Grunt, Mrs. E. Muwley (a clear-creamy-flesh) Shunghaum, Lady (2) unmorris, Hon. E. Murray, and Marchioness of Downshire — chost promising box and from which we may find some decided acquisitions. Mr. F. Cang, Colchoster, and Messes. Paul. & Son., Cheshunt, followed.

Three trusses of any new seedling or sport.—The only award was a Card of Commendation to Mr. F. Cant for a new H.-P. named Mrs. F. Cant, a sturdy grower, which in shape, colour and fulness reminded one of a pale Madame G. Luizet. A beautiful soft, rosy pink H.-P. named Mrs. Rumsey, came from Waltham Cross, but the flowers staged were rather thin. Muriel Grahame, Miss E. Richardson, and Leinster were shown from the famous Newtownards firm. Bladud from G. Cooling & Soys, Bath, but inferior to the blooms shown at Bath the same week, which would undoubtedly have earned the Gold Medal. Pride of the Valley from Mr. D. Prosser, Watson Nursery, Gloucester, completes the list,

AMATRURS

THE CHAMPION TROPHY CLASS: thirty-six blooms, distinct. This class was open to all amateurs, and the coveted Trophy and Gold Medal were won by the Rev. J. H. PEMBERTON,

For thirty-siz singles, irrespective of the number of plants grown, Mr. W. Boyes, 39, Duffield Road, Derby, beat Rev. J. H. Pemberton with some bright and clean blooms. Maman Cochet, Marie Banmann, Marie Verdier, Alfred Colomb, Ulrich Brunner, Pride of Waltham, General Jacqueminot, La France, Innocente Pirola, Madamo de Watteville, Edouard André, G. Luizet, Souv. d'Elise Vardon, A. Rigotard, Niphetos, Baroness Rothschild, Thomas Mills, Etoile de Lyon, Madame Hausmann, Cleopatra, P. Figaneau, Madame Lyon, Victor Hugo, Mr. J. Wilson, Horace Vernet, S. M. Rodocanachi, Madame Hoste, Duke of Wellington, Caroline Testont, Com-Madame Hoste, Duke of Wellington, Caroline Testont, Com-tesse de Nadaillac, Mrs. J. Laing, Augustine Guinoisseau, Frince Arthur, Her Majesty, F. Michelon, and A. K. Williams being the varieties. The Rev. J. H. PEMBERTON had good examples of Mrs. J. Laing, Her Majesty, Earl of Pufferin, F. Michelon, A. K. Williams, and Victor Hugo, but had evidently thrown his chief strength into the trophy

EDWARD MAWLEY, Eso (Honorary Secretary of the National Rose Society.)

Havering-atte-Bower, Essex; his flowers were clean, and of fair size. The varieties staged were Her Majesty, Ulrich Brunner, Mavie Baumann, Earl of Dufferin, Mrs. Jno. Laing. A. K. Williams, Gustave Piganeau, Etienne Levet, Mrs. R. G. S. Crawford, Countess of Rosebery, Louis Van Houtte, and Madame C. Crapelet, in the back row; Puppy Jamain, S. M. Rodocanachi, Horace Vernet, Catherine Mermet, Marshal P. Wilder, Marchioness of Londonderry, Jeannie Dickson, General Jacqueminet, Comte Raimband, Baroness Rothschild, François Michelon, and Countess of Oxford, in the middle row; Prosper Langier, La Havre, Captain Hayward, Charles Gater, Marchioness of Dufferin, Xavier Olibo, ward, Charles Gater, Marchioness of Dufferia, Xavier Olibo, Madame E. Verdier, Victor Hugo, Caroline Testout, Be uity of Waltham, Charles Lefebvre, and Mons. E. Y. Teas, occupying the front of the stand. Mr. E. B. Lindsell, Hitchin. was a close 2nd, and had U. Brunner, Her Majesty, G. Figaneau, Victor Hugo, Marie Baumann, Caroline Kuster, and Merveille de Lyon, in good form; Mr. H. V. Machin, Gateford Hill, Worksop, followed.

class. T. B. HAYWARD, Esq., Woodhatch Lodge, Reigate, was a good 3rd.

For twelve of any Rose steept Tea or Noisette, Mr. H. V. Machin, Worksop, won with Her Majesty, the same box containing the Silver Medal H.P for best bloom among amateurs. E. B. Lindsell, Esq., was 2nd, with Merveille de Lyon; and Colonel T. H. Pitt, Turkey Court, Maidstone, 3rd,

with Mrs John Lung.

In a division open only to growers of fewer than 2000 plants of exhibition varieties, Mr E Mawley, Rosebank, Berkhamsted, won for twenty-four singles, his best flowers being Alfred Colomb, Etienne Levet, M. Baumann, K. A. Victoria, A. K. Williams, Star of Waltham, Maman Cochet, Prince Arthur and Her Majesty Mr. Colin Romaine, The Priory, Old Windsor, and Mr. A. Slaughter, Jarvis Villa,

Steyning, followed
Nine blooms of any Rose, except Tea or Naisstte -Mr. A. SLAUGHTER was in front of Mr R. E. West, Reignte, by his Alfred Colomb beating Ulrich Brunner.

An extra class of eight distinct trebles was won by Rev. J. H. Pemberton; H. V. Machin, Esq., Worksop, being a close 2nd; and E. B. Lindsell, Esq., Hitchin, 3rd. Many growers expressed their opinion that the two last awards should have been reversed; the 3rd prize stand was excep-tionally clean and well set up. There were four other conpetitors

In the division for growers of fewer than 1000 plants, the class for nine distinct singles was a strong one. Ten lots were staged. Mr. M. Whitter, Belgrave Avenue, Leicester, won with La France, Prince Arthur, Mrs. J. Laing, Ulrich Brunner, Carohne Kuster, Duke of Edinburgh, Baroness Rothschild, A. Colomb, and a grand bloom of K. Augusta Victoria; Mr. Conway Jones, Hucelecote, Gloucester, and Mr. C. E. Shea, Foot's Cray, Kent, were 2nd and 3rd.

Six distinct trebles.—Mr. W. Whittle was also in front in this class; Dr. Tucker, Swanley Junction, Kent, 2nd; and Miss Mellish, Hodsock Priory, Worksop, 3rd.

For growers of fewer than 500 plants, nine distinct singles.—Mr. H. Foster, Ashford, Kent, was 1st, and staged Earl of

Dufferin, Etienne Levet, Baroness Rothschild, Marie Brumann, Merveille de Lyon, Alfred Colomb, Madame G. Luizet, Louis V Hontre, and Duppy Jamain. Mr. G. Moules, Hitchm, being a close 2nd, with a stand containing a good Captain II (yward and Ernest Metz. Mr. R. Miller, Bellevue House, Sutton, was 2rd.

House, Sutton, was 3rd.

Ste distinct single trasses.--W. D. Freshetelle, Esq., The Wilderness, Reigate, beat nine other competitors in this class with Etienno Levet, Her Majesty, Merville de Lyon, Urich Brunner, S. M. Rodormachi, and Charles Lefebyre, in good form. Mr. E. R. Smith, Welford Lodge, Muswell Hill, was 2nd. Mr. J. Wallender, Hodsock Priory, Worksop, and H. P. Landon, Esq., The Lodge, Brentwood, Iollowing.

Four distinct articles (webles).—Mr. H. P. Landon, was 1st, Mr. J. Parker, Old Headington, and W. D. Frenkert.

Mr. J. PARKER, Old Headington, and W. D. FRESHFIELD,

Fig. Reigate, 2nd and 3rd

The Harkmas Challenge Cup affered for twelve Singles drew seven competitors, the fight was close between 1st and 2nd. O. G. Orren, Esq., Colchester, was successful with The Bride (Silver Medal Tea, Grand Mogul, Madame Ussin, Madame de Watteville, Ulrich Brunner, Madame Hoste, Gabrielle Luizet, Catherine Mermet, K. A. Victoria, Ernest Metz, Brides-Bedale, was 2nd, having some good blooms in Contesse de N duillae, Mrs. J. Laing, A. K. Williams, and Fisher Holmes; Dr. Tuckes, Swanley, and Mr. Whithe, Lefcester, were awarded 3rd and 4th respectively.

Six blooms of any Rose except Trus or Noisettes, - Mr. R. L. Langton, Raymead, Hendon, won with Mrs. J. Laing; Dr. Tecken, Swanley, was 2nd, with the same variety; Mr. E. Monros, East Bond Street, Leicester, 3rd, with Alfred Colomb; and Mr. K. H. GIFFORD, Holyrood, Streatham, 4th, with Mrs. J. Laing.

with Mrs. J. Laing.

L. an extra open Class for righteen Singles, the Veitch Memorial Modul and E'r was awarded to P. C. BURNAND, Esq., Refigite, who staged Baroness Rothschild, S. M. Rodocumehi, W. de Lyon, Ulrich Brunner, Her Majesty, Rosieriste Juvobs, Lord F. Cavenelish, Wrs. J. Luing, Annie Wood, E. Y. Tets, A. Colomb, C. Testout, Eurl of Dufferm, Mrs. S. G. S. Crawford, Melame Cusin, Gubrielle Luizet, and Duke of Michael R. E. West, L.

Crawford, Madame Cusin, Gibrielle Luizet, and Inke of Limburgh. R. E. West, Esq., Regate, had a good Contesse de Nachallac, Dr. Anchy, and Abel Carnère in his 2nd prize stand; Mr. A. Slaughter, Steyning, heing 3rd, The Dod son Challeng, Cup, for a source for an interface by Alberton, Violation, with word with why E. B. LINDSLLE, Esq., Hitchin, who had Helen Keller, Earl of Dufferin, Marchoness of London-leavy, Mrs. S. Crawford, Muriel Grah mie, and Margaret Inckson; the Rev. J. H. Pemberton was 2nd; and H. V. Machin, Esq., 3rd. For sec studies, one and it of similaries who have over non a

was 20c1; and H. V. M. W. H.S., Esq., Srd.

For six simples, open indu to Amateurs who have were won a price at the N. R. & Exhibitions—Mr. A. Muni, Hedgerley, near Slough, was 1st, with Innocente Pirola, G. Piganein, C. Testout, C. de Nadaillac, Madame Cusin, and Edith Offford; Mr. H. Aramson, South End, Bedile, a good 2nd; Mr. G. A. Hammond, Cambrian House, Burgess Hill, and Mr. A. C. Gifford, Selburst, 3rd and 4th

A second class for six, but open only to members who have ined ince the previous Constal Palace Show, found Mr. E. Brunner, F. Krüger, Catherine Meruet, C. de Nadaillae, Cleopatra, and Madame H. Jamtin. Mrs. E. C. Simpson, Wray Park, Reigate; and Mr. R. Cook, Stourhridge Park, N.W., following.

A piece of plate officed for six singles grown within 8 miles of

Charing Cross was secured by Mr. R. H. Landton, Raymead, Henden, with good examples of S. M. Rodocanachi, Her Majesty, Marie Baumann, Mrs. J. Laing, A. K. Williams, and Mrs. R. G. S. Crawford, K. H. Gifford, Esq., Holyrood, Streatham; and E. R. Smith, Esq., Wellford Lodge, Muswell Hill, followed in like order.

NEW POSES

The Rev. J. H. Pembersion won in the class for six new Roses with Captum Hayward, Mrs. R. G. S. Crawford, Char-lotte Guillemot, C. Gater, Murchioness of Downshire, and Helen Keller. Mr. J. Bateman, Rose Vale, Highgate, being TEA AND NOISETTE SECTION

The flowers in this division were by no means up to the The flowers in this division were by no means up to the stundard seen it Reading, and in the Trophy class were very weak. The Trophy and Gold Medal were won by O. G. Orfen, Esq., Colchester, for the following eighteen varieties—Innocente Firela, Bridesmidd, Anna Olivier, Madame Cusin, The Bride, Maman Cechet, Souvenir d'un Ami, Catherine Mermet, Madame II. Jamain, Comtesse de Nadaillac, Madame Hoste, Ethel Brownlow, Corneha Koch. Fdith Gifford, Marie V. Houtte, Sylph, Etoile de Lyon, and Souvenir d'Elise Vardon. The 2nd prize stand, from C. J. Grahame, Esq., Leatherhead, contained good Comtesse de Naddillac, Ernest Metz, Maman Cochet, and Innocente Pirola. The Rev. A FOSTER-MELLIAE, Ipswich, was 3rd, only two others competing.

Twelve single blooms, distinct.—O. G. Orffen, Esq., was also 1st in this class; Mr. A. Tale, Downside, Leatherhead, and H. V. Machin, Esq., Worksop, following.

The piece of plate for eight tiebles was secured by C. J. Grahame, Esq., Leatherhead:—The Bride, Maman Cochet, I nocente Pirola, Comtesse de Panisse, Madame Cusin, Comtesse de Nadaillac, Ethel Brownlow, and Francisca Kritger; Mr. W. Boyes, 30. Duffield Boad, Derby, and the Rev. A. Foster Melliar, Ipswich, 2nd and 3rd.

Nine blooms of ray Tea or Noisette, -Mr. Grahame was 1st with Manan Cochet; Mr. O. G. Orten 2nd, with Madame Cusin; and Mr. H. V. Machin 2nd, with the same variety as the winner.

In a division open to grewers at fiver than 500 plants, the 1st prize for twelve distinct varieties went to Mr. J. PARKER, Old Headi gton, for Jean Ducher, Madume Hoste, Souvenir d'nn Ami. C. de Nadaillac, E. Brownlow, The Bride, Catherine Mermet, E. de Lyon, E. M. tz. C. Kuster, Princess of Wales, and Souvenir de S. A. Prince; Mr. Conway-lones, Hucclecote, Gloncester, 2nd.

Nine single blooms, d stinut. Mr. R. H. Langton, Hendon, was in front with Cleopatra, Niphetos, Maman Cochet, C. de Nadaillac, Madaine de Watteville, E. Brownlow, Madaine Cusin, Innocente Pirola, and Sonvenir d'un Anii; Mrs. E. Croft Murray, Perivale, Ryde, and Miss Baker, Holmfels, Reigate, were 2nd and 3rd.

Nine blooms, distinct, from geovers of fiver than 200 plants, were best from W. D. Freshfield, Esq., Cloopatra, C. Kuster, C. Mermet, Mrs. J. Wilson, Marcohal Niel, Devoniensis, Edith Gifford, C. de Nadaillac, and F. Kruger, being the varieties staged. Mr. J. Parker, Old Headington, was a close 2nd, and Mr. A. Evans, Marston, near Oxford, 3rd

See blanus, distinct,—Twelve competed in this class, H. P. LANDEN, Esq., Stenfield, Brentwood, just succeeding in beating Mr. WHOTTLE, Leicester; Mr. R. FOLEY-HOLES, FORGET Street, Worcester; and the Rev. G. E. JEANS, Shorwell Vicarage, I.O.W., being 3rd and 4th.

A pure of Plate for four distinct trebles was won by R. H. LANGTON, Esq., Raymead, Hendon, with one of the cleanest stants in the show, Monon Cochet, Madame Cusic, Ethel Brownlow, and C. de Nadaillac, being very good; Mr. J. PARKER, Old Headington, was 2nd, and Conway Jones, Esq., Huccleoote, 3rd.

Sublems of any Ten or Noisette -Mr. Conway Jones won with Niphetos, Mr. J. Parker was 2nd with C. de Nadaillae, and Mr. R. H. Labgion 2rd with Innocente Pirola.

In an extra class for aim bunches, seen trasses to a bunch, Mr. J. Parker, Old Headington, best Mr. H. V. Macilla, Worksop,

GARDEN ROSES.

A Silver Cup presented for eighteen bunches of distinct varieties in a space 5 feet by 3 feet, was won by H V MACHIN, Esq., who staged a very pretty lot. The most pleasing were macrantha, The Pet Maiden's Blush, Thoresbyana, Cecile Brunner, Madame P. Ducher, and Bardon Job.

In the second stand, which ran Mr Machin very close indeed, Mr. A. Tate, Leatherhead, had Hebe's Lip, Perled'Or, macrantha, moschata nivea, and Gloire des Roomanes (good).

The Rev. J. H. Pemio Rton, Havering-atte Bower, was in front for a stand of nine bunches, Polyantha, Madame Georges Braant, Marquise de Salisbury, and Leopoldine d'Orléans being excellent. Mis. D. G. Nesfield, Speldhurst, Kent, and Miss Mellisu, Hodsock Priory, Worksop, were 2nd and 3rd.

MEDAL ROSES.

Considerable difficulty was experienced before the judges could aword the medals. Flowers of exceptional merit were scarce. In the amateur's classes the Medals were awarded to the Bride, shown by O. G. Orden, Esq.; and Her Majesty, from H. V. Machin, Esq., Worksop. La Duchesse de Morny gimed the Medal for H.-P. in the nurserymen's classes, and Innocente Pirola for Teas or Noisettes. The former was shown by Mr. B. R. CAST in Class I., and the latter by Messer, Harkniss & Son also in Class I.

MISCELLANEOUS EXHIBITS.

Tre largest of the bonorary exhibits was made by Mc sis. Ino. Laira & Sov., Forest Hill, London, S.E. This firm half a large group of choice plants arranged to fine effect, Caladiums, Begorias, Crotons, Ferns, Nepenthes, and other such subjects being well shown. A large display of cut Roses, Pinks, Carnations, Gladiolus, and general hardy flowers was also contributed by Messis, L. 180.

Messys. Geo. Jackman & Son, Woking, exhibited cut Roses and Pinks; Messys. Carfer & Co., High Holbern, Sweet Peas and other hardy theorem. Messys. J. Cheal & Sons, Crayley, hardy flowers and Volas; Mr. E. G. Foster, Brockhampton Nuisevy, Hayant, a collection of Sweet Peas; Mr. M. Priterard, Christchurch, an excellent collection of Incity flowers; and Messys. Wallace & Co., Colchester, an exhibit of Colorbotts, and numerous Lalies, for

hordy flowers; and Messys, with act & Co., Colchester, an exhibit of C dochortus, and numerous Ialies, &c. A. F. W. Haywarn, Esq., exhibited a collection of seven choice paintings in oil, six of which represented Koses, and one of turin Paintes. The Society showed its appreciation of the quality of these by the bestowal of a Silver Medal.

NATIONAL ROSE SOCIETY, READING.

This town has long been a centre of horticultural interest; half a century ago growers of the show Pelargonium regarded it with favour, for there Mr. Hoyle, whose flowers remain in our catalogues to the present day, made those marvellous improvements in conjunction with Mr. Forster of Clewer which made the flowers so popular that the prices of novelties ranged from two guineas up to five guineas. Here, too, arose that extensive seed establishment of Messrs, Sutton & Sons, whose world-wide connection has made Reading known all over the civilised world. Of late years, too, the lovers of that old-fashioned flower, the Auricula, have turned their thoughts towards Reading, as some of our best growers hail from there. When, then, the National Rose Society received the invitation to hold its southern exhibition there this year, I felt pretty sure that everything would be done to make it a success. In the neighbourhood, too, we knew that we had two very active members of our society, the Rev. Alan Cheales and Mr. J. T. Strange. So we looked forward with light hearts to the exhibition-day; but the only question was, would it be a fine day? for as the exhibition was to be held in the open air, this was indispensable. Happily, although there was some little threatening in the morning, the day proved very fine; and as the arrangements were all that could be desired, carried out as they were by the Secretary and other members of the committee, headed by their chairman, Mr. Ferguson "all went merry as a marriagebell." The creature-comforts of the judges, exhibitors, and officials were admirably attended to, for Mr. Ferguson had invited them to partake of an excellent luncheon, and the hospitality with which they were welcomed will not soon be forgotten. The show was held in the old Abbey ruins, and as the surface was undulating, it reminded one of the Royal Botanic Society's shows in the Regent's Park, and certainly a more charming position could hardly be imagined. The grey walls of the ruins enclosed the exhibition-ground, while a canvas covering gave that subdued light under which Roses look so well. As you have already given a list of the winners, I shall, instead of going over the same ground again, put forward a few salient points which I think worthy of note.

Our Rose shows have often been decried on account of their formality, but this exhibition, I think, showed the impossibility of avoiding this; here was an undulating space, green grass, various plants and flowers, but you could not get rid of the stiff fermal boxes, nor do I see how it can be done, for as the flowers must be shown to the best advantage, and so arranged that they can be seen on all sides. I think it passes the wit of man to devise any more effective method than that which has been in use for so many years. The banks also were very pretty, but as many of the Roses were lower down than the line of vision, it was not so easy for persons with short sight and stiff backs to see them as when they were on stages. The anticipations which had been formed with regard to the character of the flowers was, I think, fully borne out; no one expected very large flowers, and certainly, as a whole, they were undersized. The Teas were not shown at their best; probably the cold weather of May and the early part of June had interfered with them, and when Roses are a long time in coming out, they are never fully up to the mark. As usual, East Anglian

grewers were to the front, and the two firms of Cant and the Priors exhibited some fine flowers. as did also Messrs. Harkness of Bedale and Hitchin; while amongst amateurs Mr. E. B. Lindsell, Rev. J. H. Pemberton, Mr. Orpen, and Mr. Charles J. Grahame had some excellent flowers, and yet with all that, there was not much of very superior character. I should probably name Mr. B. R. Cant's forty-eight, the Rev. J. II. Pemberton's box, which won the coveted Sutten Prize, and Mr. Prior's box of Horace Vernet, as amongst the best in the show. There was certainly an absence of very new Roses, and many of those whose names have been before the Rose-growing public as claimants for particular notice were conspicuous by their absence. The medal Roses were, as they ought to be, good; Messrs. Harkness & Sons' A. K. Williams being a good example of that old flower; while Mr. B. R. Cant's Maman Cochet fully deserved the medal which it obtained. Mr. Orpen, who has a knack of showing medal Roses, won in the amateur's class with Kaiserin Augusta Victoria and Madame Hoste, the former as a hybrid Tea, and the latter as a Tea, but I always stand very much in doubt as to whether the former is distinct enough from the Teas, for it certainly has very little of the hybrid in it. Another excellent feature of the show was the exhibition of garden Roses; exhibitors have realised the fact that it is not sufficient to have bunches of bright and pretty flowers, but that they must be tastefully arranged, and not all "jammed" down together. The collection shown by Messrs. Cooling & Sen was an admirable example of careful and tasteful arrangement; many, however, of some of our prettiest single Roses were over. It is always difficult to have them late in June, and the early character of this season made the difficulty greater. Noticeable amongst Mr. Cooling's lot was a beautiful group of Marquise de Salisbury, a brilliant Hybrid Tea, and one of the most effective of our new garden Roses. Messrs. Paul & Sons of Cheshunt had also an excellent collection, tastefully arranged, amongst which their single Carmine pillar showed up brightly. Mr. II. V. Machin also showed excellently; indeed, he has been one of the chief pioneers in the more tasteful arrangement of garden Roses, while probably his more northern position in this forward season is much in his favour. I have many complaints on this score; one grower writes to me, "All my Roses were over three weeks ago;" while another said to me at Reading, "I doubt whother I shall have anything for the Crystal Palace. I fear this is my first and last appearance for the National." Although there were no sensational blooms, such as we have seen in fermer years, a considerable number of the old favourites were exhibited in good form. Marie Van Houtte, Innocente Pirola, Edith Gifford, and Comtesse Nadaillac were well shown amongst Teas; while Marie Baumann, Duchesse Morny, Count de Raimbaud, and A. K. Williams, were also well shown, so that notwithstanding the additions made to our lists in late years, the older varieties must still hold their ground. Of the Irish-raised Roses, Margaret Dickson was the best, and the season seems to have suited it, as I find most persons speaking well of it this year.

There is no one, I think, who visited Reading that will not carry away with them pleasant reminiscences of this visit of the National; everything was done to make it successful, and one can only hope that the fillip which has been given to Rose growing in this flourishing town may result in a wider appreciation and more extended cultivation of the queen of flowers.

Wild Rose

IRISH-RAISED ROSES.

FEWER than two decades ago we were almost entirely dependent upon Continental growers for our supply of new Roses. Then came a rush of Englishraised varieties; so much so, that we annually look forward to the new introductions from home-firms. When the late Mr. H. Bennett turned his attention to the systematic crossing of Roses, with such excellent results as Earl of Pembroke, Heinrich Schultheiss, Her Majesty, Mrs. John Laing, Cleopatra, Princess Beatrice, Princess of Wales, Grace Darling, Lady Mary Fitzwilliam, Viscountess Folkestone, and others, we were fast becoming comparatively independent of French and German raisers. In 1887, Messrs. A. Dickson & Sons, Newtownards, Ireland, sent out three grand Roses in Miss Ethel Brownlow, Lady Helen Stewart, and Earl of Dufferin. Ethel Brownlow has more than once carried off the Medal as being the best Tea-scented Rose in the exhibition of the National Rose Society. If memory serves me correctly, Earl of Dufferin has done the same. Caroline D'Arden and Lady Castlereagh in 1888 have not turned out such complete successes as the rest of the Irish Roses, but the following year we had a grand Tea in Mrs. James Wilson, a good Hybrid Perpetual in Lady Arthur Hill, and a fair Rose in Mr. James Brownlow. Jeannie Dickson, and T. W. Girdlestone are decidedly the best of 1890, the first-named being a grand Rose. Margaret Dickson, in the following year, was not thought very highly of this side of St. George's Channel until it was seen in 1894, when the season just suited it. Since that time it has been a constant Rose with us, and is decidedly one of our very best light-coloured Roses. This was the first one to secure the coveted honour of the Gold Medal presented by the National Rose Society for any new Rose, a prize that is only awarded to those of really sterling merit, and which it gained the year previous to introduction. There is a wonderful contrast in the growth of this Rose and Marchioness of Dufferin, its companion in 1891. The first not infrequently produces shoots 12 feet long and upwards, flowering throughout their entire length when pegged down ; but the second is decidedly moderate in growth, albeit, still a grand Rose. Once the ice was broken as regards the Gold Medals for new Roses, Messrs. Dickson won with Margaret Dickson in 1890, with Marchioness of Dufferin in 1891, Mrs. W. J. Grant in 1892, Marchioness of Londonderry and Mrs. Sharman Crawford in 1893, Marchioness of Downshire in 1894, and Helen Keller in 1895.

Cards of Commendation were given in the same year for Conntess of Caledon, Muriel Grahame, and Lady Mozra Beanelerk, all three of which the writer fully expects to see awarded the higher honour at the forthcoming shows.

In 1893, we only had one Rose from Newtownards, viz., Marchioness of Londonderry, a clear ivory-white of immenss size and substance. Next year gave us Mrs. R. G. Sharman Crawford. l cannot say enough of this Rose. In my opinion, it is one of the best half-a-dozen Roses ont of over 2000 varieties now in cultivation. Always good, whether the season be bad or not, and like that other grand introduction by Mr. H. Bennett-Mrs. John Laing-is sure to be in every collection. Marchioness of Downshire, of the same year, is also a good Rose, and with me is at present very good, both upon maidens and cutbacks: 1895 gave us Mrs. W. J. Grant, syn. Belle Siebrecht. This won the Gold Medal at Chester in 1892. Messrs. Dickson, having sold the entire stock to an American firm, the latter elected to distribute it under the name of Belle Siebrecht, a measure which has been justly condemned on this side of the Atlantic, seeing that it had, some three years previously, been already certificated under the name chosen by the raisers, and this by what is undonbtedly the highest Rose authority in the world. I was much struck with this Rose at Chester in 1892, and predicted a grand future. The delay in sending it out to the public was not so much on account of its being sold by the raisers, as an accident to the vessel in which the entire stock was consigned. In fact, for

some little time it was doubtful if the few plants secured would recover from the effects; and even now I trust to see it develop more vigour as time goes on, and the excessive strain of propagation is removed. It has the good characteristics of producing its blooms upon very upright stems, retaining its shape from bud to expansion, and being one of the most distinct and clear pinks we have. Last year also gave us Helen Keller, a bold and well-formed flower of a bright rosy cerise, and most distinct. Mayourneen, a silvery-white flesh; and Marjorie, white, flushed with salmon-pink, are also of 1895. This year we have Muricl Grahame, a sport from that grand Tea, Catherine Mermet, which has given us The Bride, Waban, and others of great and tried merit. This is a pale cream, with a slight flush of rose, and will most decidedly be one of our grandest Teas. Tom Wood and Ellen Drew, two companions to Muriel Grahame, will no doubt keep up the reputation of this firm.

I have had exceptional opportunities to form an opinion upon the newer Irish-raised Roses, seldom missing either of the three annual exhibitions of the National Rose Society since its formation, and growing each variety in fairly large numbers as soon as procurable. One more remark about these Roses. Last year at the National Rose Society's exhibition at the Crystal Palace, the first-prize stand for twelve new Roses contained no fewer than ten raised at Newtownards, and we must remember that the term 'new" only includes those put into commerce within the recent three years. I have my notes before me, and the ten consisted of Mrs. R. G. Sharman Crawford, Shamrock, Avoca, Marchioness of Downshire, Tom Wood, Lady Mozra Beauclerk, Marchioness of Londonderry, Helen Keller, Mayonrneen, and Muriel Grahame : the two from other sources being Captain Havward and La Fraicheur. The only awards for new Roses went to the same firm. A Gold Medal for Helen Keller, and Cards of Commendation for three others. The first prize for any new Rose (twelve blooms), was taken by Mrs. Sharman Crawford, and the two following prizes by Marchioness of Londonderry and Jeannie Dickson; all three being raised and distributed by Messrs. A. Dickson & Sons, and this was also the case in the previous year. When we remember that these Roses had to be cut some thirty hours and travel about 600 miles before being staged. need I say more about the undoubted excellence of the Irish Roses in every respect? A. Piper.

GATTON PARK.

This fine estate of 1000 acres, purchased in 1888, by Jeremiah Colman, Esq., is situated near Merstham, in a charming part of the county of The mansion, of fine proportions, commands charming views of hill and dale from all sides, some of which were blocked ont by trees till Mr. Milner, who was employed to lay-out and remodel the gardens, opened them. On his acquisition of the estate, Mr. Colman lost no time in putting everything about it in perfect order, making a beginning with the house, which is now architecturally beautiful, whereas formerly it was a plain and angular structure. The Marble Hall, which it is estimated cost £100,000, and in which the rarest marbles from the Baths of Caracella, and other matchless marbles, are employed, has been largely added to by Mr. Colman. It is his intention to erect a Palm-house in which to grow large specimens of these and other species of plants of service in decorating these immense halls. small plants being lost to view in them, and affording a very insignificant effect.

From the terrace looking towards Nntfield, Redhill, and Reigate on one side, there are exquisite views, and the estate itself affords a beautiful foreground to the picture. Here are remarked stately Beeches, Oaks, and Elms; giant Hollies, Yews, clumps of huge Cedars of Lebanonare objects which afford the chief beauty and grandeur of the picture. A chain of lakes lies in the bottom, increasing in size till the greatone at the lowest point is reached. Walks bordered with shrubs and gay with flowers, skirt the bauks of these pieces of water.

Here, as in other gardens, it has been found that the Rhododendrons which usually make such a brilliant display, have not lasted in beauty for so long a period of time as in other years, and the duration of the flowers and those of the hardy Azaleas has been transient. The quaint old Town Hall is situated beneath a giant Chestunt near the house, and there in the times when Gatton used to return two members of Parliament, the said members were nominated, and here also was many a festive scene enacted. Close by are the remains of an old covered way, which formerly led to the mansion, which are now turned into a grotto and rockery; and not only at this spot, but throughout the grounds, many remains of former times are to be noticed. The resary within neatly-clipped Yew hedges was bright with Roses; the beds of Iris, which are great favourites here, were well furnished with bloom; the broad borders of hardy herbaceous plants being gay with flowers in season. These borders are found in the kitchen-garden and other parts of the place, and they afford a brilliant floral display and fine source whence to gather flowers for the decoration of the rooms.

THE GLASS-HOUSES.

Those houses which existed when the estate was acquired were of little use for gardening as carried on under modern methods, and the Beeston firm of Messrs. Foster & Pearson was entrusted with the erection of new structures, a work they have so far carried out in excellent manner, but which is far from being completed, the old range of vineries, &c, being only at the present time in course of demolition, in order to make space for the new ones. Orchids have for some time past been gaining favour at Gatton, and the successful manner in which they are cultivated by Mr. King, the gardener, well warrant the increased accommodation which it is intended to afford this class of plants. There exists a commodious house filled with vigorous, thriving plants of Odontoglossum, Masdevallia, and other species of cool-house Orchids, among which in bloom or in bud were numbers of very fine O. crispum, O. Pescatorei, Masdevallias, with high-coloured flowers; a few of Cochlioda Noezliana, of Oncidium macranthum, of O. incurvum, of Odontoglossum cirrosum, &c. Here also is one of the largest plants of Sophronitis grandiflora in the country.

The largest Orchid-house is chiefly filled with plants of Cattleya and Lælia, all of which are in excellent condition, and in some of those which were purchased a few years ago as established plants from different collections, increased vigour is noticeable every year since they have been at Gatton. The following were remarked in flower: - Cattleva Gaskelliana, which is one of the freest of the varieties of summer-flowering C. labiata, as the old autumnflowering form is of the late-flowering ones; some excellent C. Mossiæ, Lielia tenebrosa, Lielio-Cattleya Schilleriana, &c. The plants of Miltonia vexillaria and M. Roezlii are wonderfully thrifty, a plant of a good variety of the former having ten flowerspikes, and some of the latter produce their large fragrant blooms with freedom. Suspended overhead were fine plants of Odontoglossum citrosmum having long racemes of flowers, that named O. c. punctatissimum being a beautiful, rose-tinted flower, large, and profusely furnished with purple-coloured spots. In bloom were Dendrobium Brymerianum, Cypripedium Lawrenceanum, C. barbatum, C. hirsutissimum, Sobralia macrantha, and a few other species. In sev-ral other houses, not entirely devoted to Orchids, some species of plants likely to succeed under the same conditions are accommodated. In one large warm house, for iustance, were plants of Stephanotis floribunda, scarlet-flowered Hibiscus, and the nightblooming Caetus in flower on the back wall; and arranged with Anthuriums, Clerodendron Balfourii, and other stove plants, were Dendrobiums perfecting their growth, a very fine specimen of the large yellowflowered Sobralia xantholeuca, and a few other Orchids of large growth, in good condition. The front of this house was taken up with Crotons, Draceuns, &c., while fine plants of Nepenthes were suspended above them. In a small house, the roof of which is covered

with tailing stems of the Cucumber, were growing varieties of Calanthe, in course of preparation for winter flowering; some very fine plants of Cattleya Trianæi, C. labiata, and other semi-established Orchids. At the end of another house, in which was a good crop of Tomatos, and a number of flowering plants of Gardenias, were paufuls of Caclogyne cristata, &c., and in other houses are specimens, which from time to time get shifted about to wherever they may be expected to succeed—a plan which, where sensibly carried out, greatly adds to the longevity of many species.

Ultimately, it is intended to divert the old Odontoglossum house, which was found to be unsuitable the evidences of former grandeur and vigour still remain, so far as many of the fruit-trees are concerned, decaying, it is true, but still interesting and useful. One healthy old giant as a wall-tree is truly remarkable, viz., a Uzedale's St. Germain Pear, the main stem of which is of immense size, and the horizontally - trained branches extend exactly 100 feet. It is difficult to name the time which this fine old tree must have occupied its present situation, but it must be considerably over 100 years, and during that period of time what changes in the methods pursued in the garden must have taken place! The old Apricot-walls, too, have

middle; tapering thence towards both ends they are, as the specific name denotes, rhomboidal or lozenge-shaped. They are dark-green, with a tinge of purple when young, and before falling in autumn become a fine bronzy-purple. The flowers, which appear whilst the shrub is still leafless, are borne in pairs; individually they measure 2 inches in diameter, the petals being oblong and rounded at the apex. The colour is purple, with a certain amount of rose in it, but approaches nearer the blue side of the colour-scale than any other bardy Azalea. It is a native of Japan, and was first discovered in the mountain forests of the island of Niphon. When fully grown

Fig. 9.—RHODODENDRON RHOMBICUM: COLOUR OF FLOWERS PURPLE AND ROSE,

for cool-house Orchids, and which now contains Gloxinias, Adiantums, and small stock of various kinds, to the culture of Cattleyas; and when the contemplated new Tea-Rose house is finished, the house in which the Roses now are may be arranged as an intermediate-house.

The greenhouse range is bright with Pelargoniums, Souvenir de la Malmaison Carnations, and other florists flowers; and all parts of the garden are neat, and in a well-kept condition, notwithstanding the work connected with renovation and re-building now in progress.

THE KITCHEN GARDENS.

These are extensive, and consist of two classes—the large modernised one in which everything is done in the best manner; and the old gardens, in which

some very remarkable trees.—still very prolific, and ancient specimens of other kinds of fruit-trees are plentiful. In one of the walled-in gardens a large number of Chrysanthemums in splendid condition was observed.

RHODODENDRON RHOMBICUM.

ALTHOUGH an extremely rare species in European gardens, this Rhododendron has for many years past been growing in the arboretum at Kew. There is one specimen there—a bush about 4 feet high, which flowers freely in April every year. The species belongs to the Azalea group, and is allied to the charming R. Schlippenbachii (see fig. 87, p. 561, of last volume). It is deciduous, its largest leaves being 2 inches long, and 1½ inches wide at the

it is perfectly hardy, and ripens seed freely, but, like many other Japanese plants, it is tender when young, and its rarity, no doubt, is due in a great measure to the seedlings being liable to be killed during winters of even ordinary severity. Whilst they are in nursery quarters, a thick layer of dry leaves ought to be spread over the ground during winter, and a rough framework to support a few mats during the severest weather is advisable. Less protection is needed as the stems become more woody, and after they are 12 or 18 inches high, none is needed. The large plant at Kew, from which our illustration was taken (fig. 9), is never protected, and such frosts even as those of February, 1895, did not injure a single twig. The species was given an Award of Merit by the Royal Horticultural Society on April 24, 1894, W. J. B.

LÆLIA PURPURATA ASH-WORTHIANA, NEW VAR.

This superh variety (fig. 10) differs from all others in cultivation, not only in the superb coloration of the lateral petals, partitioned with bold white stripes, but in their abnormal breadth. It was described at p. 758, col. e, and at p. 759, eol. a, and we now add the following particulars sent by Mr. Ashworth. "I measured the flower and found as follows: width of petals, 1½ inch × 3 inches long, margined with white from centre of petals to the base of column; also white stripe 2 inch wide in centre of each petal half-way up; colour purplish-rose, with stripes as dark as the lip. Petals stand out at about

fairly tenacious loam, sweet and fibrous, in which Grape-growers generally so much delight, the Grape culture here would have called for no special comment. But Mr. Bury did not select this sandy soil originally for the purpose named; the vineries, which are locally known as "Petersiam," had been built and planted a few years previously to his taking possession of them, and it is very easy to understand that he did so with some doubt, as he had been for thirteen years previously gardener at Tewkesbury Lodge, Forest Hill, where he was a most successful Grape grower, and took, as mexhibitor, numerous first and other prizes in the best competitions. But Grape growing in private places, especially where special attention is given to

FIG. 10.—LELIA PURPURATA ASHWORTHIANA

 45° angle from lip. Sepals ξ inch wide and 3 inches long, white, with pinkish-rose lines, reflexed. Tube of lip 2_{5}^{3} inches long, white with rose stripes, and extremity of lip 1_{5}^{1} inch in width, dark purple tinged with a little yellow; perfumed." J.~A.

GRAPE-GROWING ON SANDY SOIL.

PROBABLY there are few growers of Grapes for any purpose who would deliberately select for Grape culture a soil that may be termed a solid bed of sand. The Bagshot sands are well known, and just what one sees at Knap Hill or Bagshot may also be found in the soil pervading Byfleet, a village that lies between Weybridge and Woking, where Mr. J. Bury has settled as a grower of Grapes for market. Had the soil been of an ordinary character, showing a

the production of fine bunches thinly placed on the Vines, and in market vineries is very dissimilar. In the one case there is great anxiety not to over-crop the Vines, because extra fine bunches and berries are wanted. In the other it is needful to extract yearly from the Vines the uttermost of erop they can produce, and yet leave them capable of reproduction of similar crops in succeeding years. The Petersham vineries in no sense equal in extent the huge area of glass houses devoted to Grape culture at Finchley, Broxbourne, Swanley, and elsewhere. There are but two houses, but they are 25 feet wide, are of course ordinary spans, are each 336 feet long, or a total of 672 feet run. There is, therefore, ample room to test at once the capacity of the grower, and the adaptability of sand as a Grape-producing soil, and in both cases the results are most satisfactory. Only four varieties of Grapes are grown: Black Hamburgh and Muscat of Alex-

andria share equally one house, and Alicante and Gros Cohnar the other. Oddly enough, the heating-power being all at one end of the pair of houses, the Muscats in one case, and the Gros Colmar in the other; both varieties most needing heat were planted at the remoter ends. The site of the vineries is very sheltered, and the soil naturally warm; so that, on the whole, both Muscats and Colmars, in spite of the drawbacks mentioned, ripen remarkably well.

Last year, when I saw the Museats, they had in in unusual degree not only rich golden hue, but also that amber tint which characterised the Museats Mr. Hinds, some years since, used to exhibit from off the sandy soil of Minley Manor. It is not a new thing to learn that sand is advised to be applied as a dressing for borders in which Museat Vines are growing; indeed, there can be no doubt but that sand would constitute a very helpful mulch to many Vine borders where the soil is hard or tenacious, and tending to sourness because too full of humus.

Mr. Stephen Castle, a first-class Grape grower for market, not only always added sharp sand to his Muscat borders at Fordingbridge, but also generally used silicate as a manure. It is, however, unusual to find Vine borders literally all sand, and that to a great natural depth. The Vines are planted at 3\frac{1}{2} feet apart on each side of the houses, and are, of course, spur-pruned to single stems. They root better inside than outside, borders having been originally prepared and raised, yet still of sand, for there is no other soil in the locality. As the houses are but 5 feet apart, however, the intersecting outside border for two rows of Vines to run in, affords very limited room. Fearing that because of the known natural tendency of Vine roots to run downwards, they might in his case have begun to get too much into the lower sand stratas, Mr. Bury had, during the winter, trenches 20 inches wide, opened inside of each house, and on either side at about 5 feet from the stems. When roots were found they were clean cut off at the outer side of each trench, and drawn up carefully, were pegged into the trench wall nearest the Vines. Then, when all had been so found and treated, some fresh soil, really a very thin addition, consisting of wood-ashes, old pot-soil, Mushroom-bed manure, &c., was wheeled in and strewn along the top of the soil cast out from the trench. Then being mixed, a portion was thrown into the trench and trodden down; the severed roots were then unpegged and laid so that the points projected upwards at an angle of 45°, and the whole of the soil was then filled in. Such treatment might well be regarded as drastic, but the effect on the Vines seems to have been most beneficial, for throughout they are carrying splendid crops, and there can be no doubt the bulk will in every way equal, if not excel, that of previous years. Most noteworthy is the really capital flavour found in both Alicantes and Gros Colmars when ripe, whilst colour is excellent. Mr. Bury believes in the efficacy of light-ample light, as aiding coloration, not only directly, but also in imparting to the leafage that substance and vitality without which neither good colour or flavour can be looked for. Shanking seems to give no trouble whatever on the sand so long as the roots are kept out of the lower strata. A. D.

FLORISTS' FLOWERS.

THE HOLLYHOCK.

I have in previous numbers of the Gardeners' Chronicle written about the Hollyhock disease, Puccinia malvacearum; it is very trying, especially in wet seasons, but this year the plants have not suffered materially, although it appeared very early in the season. Now is a good time to put in cuttings and eyes, but care should be taken to remove every particle of the disease. The eyes are obtained from the lateral shoots, and may be inserted singly in small pots, placing them in a partly exhausted hot-bed; the leaf attached to the bul may be removed, but not the leaf stalk. Cuttings may also be obtained from the base of the plants, they form roots readily in the

aforesaid hot-bed. During the excessively hot and dry weather of the early part of the summer, the plants required a great deal of water, and to prevent evaporation the surface of the soil around the plants had been well mulched with manure, syringing the undersides of the leaves to keep down red-spider. In deep well-manured soil the Hollyhock grows very tall with the above treatment, and forms one of the most stately of garden plants. Well grouped in pleasure-grounds in front of shrubs, the Hollyhock is equally well adapted for effect at a distance, or to bear close inspection; even the single Hollyhock has its admirers, and in truth, some of the varieties are very pretty.

THE PANSY.

The distance is great between the stately Holly. hock and the lovely lowly Pansy; but each have their admirers, and each of them have passed through periods of prosperity and adversity. The Viola has now a special society all to itself, but according to the report of the special society's exhibition, the l'ansy was strongly represented; it would, therefore, be well to call the society The Pansy and Viola Society, for although the Pansy is a Viola, the two names are quite distinct for garden purposes. The hot season has certainly been very trying, both for the Pansy and Viola. Neither of them can endure the hot, dry seasons of the London district. The difficulty is to keep them free from aphis and red-spider; either parasite is sufficient to check their growth and cripple the flowers. Cuttings may now be put in, and in the south it will be found they do best on the north side of a wall, or in some similar position where they can be sheltered from too much sunshine. There is no need to put them under glass; in fact, I believe they do better in the open. If the soil is heavy, an inch or two of leaf-mould and sand put on the surface will be necessary to cause them to root freely. If the young growths have red-spider or aphis upon them, they must be dipped in a solution of soft soap and tobacco-liquor. The soft soapy water will kill the aphis, but it is necessary to add tobacco-liquor to compass the death of the red-spider.

THE POLYANTHUS.

This has been a very trying season for the Polyanthus. The season for blooming was all that could be desired, as the weather was fine, but after that no rain fell for two months, and the usual result of hot, dry weather, the leaves became rusty from the attacks of red-spider. The best varieties of the laced Polyanthus are lovely border flowers, but we in the south are confronted with hot dry weather when the plants ought to have damp, chilly nights. I well remember seeing a splendid show of them in the garden of Mr. Horner when he lived at Kirkby Malzeard, near Ripon in Yorkshire; parasites did not touch these plants, indeed Mr. Horner remarked that any plants which he received infested with red-spider gradually recovered, and this troublesome parasite died out, the air of the Yorkshire wolds not being conducive to its healthy development. Seedling Polyanthuses should now be planted out where they are to flower next season. I always choose a shady place for them; they need it more than the Auriculas do. The seed is now being saved: it is very soon scattered unless it is carefully watched, the pods open at the top, and the seed falls out. The time to gather the pods is when the seed can be seen through the transparent capsule to be of a brown colour. It may be sown now or in the spring. I sow in the early spring months, and the plants are ready to plant out in July.

THE PINK.

This is one of the most charming of garden flowers, not only for its beauty, but the delicate perfume is even more pleasing than that of the Carnation. No delay should take place in getting the slips taken off and planted in some shady part of the garden. Forty years ago I was very successful in striking them outfoldoors without any glass protection, but I always took the chance to take them off when the day was cloudy and wet; if this was done on a hot sunshiny day, the "pipings" did not root so freely. I have put a lot in this week over a hot-bed, the heat

is not excessive, but enough to heat the soil to 85° or so. The glass lights are kept over the frame, and tilted a little at the back, but at no time are they shut down close. Roots are soon formed, and care must be taken not to let the young plants become drawn, as they ought to be in niee stocky form about the end of September to plant out. It ought to be generally known that the lacing on Pinks is seldom well defined unless the plants are put out soon enough in the autumn to become well established before the winter. J. Douglas.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

CATTLEYAS .- By this season strong plants of Cattleya labiata and C. Gaskelliana will have made a considerable quantity of new growth, and in some the flower-sheaths will have appeared. Care should be taken that water is not allowed to remain in the growths, or decay may follow. At this stage it frequently happens that the outer sheath encircles the growth so tightly as to prevent air gaining access to it, a state of things which quickly causes the sheath to turn black; this arises from too much moisture being present between the sheath and the pseu labulb, and if it be not counteracted without lelay the new pseudo-bulb may decay. It is prudent therefore to examine the plants at short intervals of time, splitting the envelope from top to bottom, and thus allow the moisture to escape. The plant so treated should be kept rather dry at the root for a few days afterwards, then, if the growths are found to be sound, the plant may receive ordinary treatment. My remarks on this subject will apply to Cattleya gigas, C. Dowiana, and C. D. aurea. Among the plants of C. gigas which have finished flowering, there may be some which will require re-porting, or fresh material substituted for that which is decayed. This work should not be delayed, as new roots soon start, and a disturbance of the compost is then attended with danger. As regards plants in an unsatisfactory condition, which have not been disturbed at the roots for several years, they should be turned out of their pots, have all dead roots cut off, and the remainder washed clean. Some of these plants may not require pots so large as those they came out of, and should be placed in clean ones of a suitable size. Healthy specimens requiring more potroon should have the old pot broken in pieces, and be afforded another one a size or two The kind of compost to be used is furnished on p. 787, vol. xix. Keep the plants perfectly firm in their pots by means of stakes. The new roots on entering the fresh material furnish food for the new pseudobulbs, and it is an advantage to place the plants in a drier and better ventilated house than the Cattlevahouse, where they would enjoy more sunlight, and where the naturation of the pseudo-bulbs would be accelerated. Till re-potted plants are re-established. water should be afforded only in quantity sufficient to prevent much shrivelling, slight shrivelling does no harm. Plants of C. Dowiana and C. D. aurea may also be re-potted as they go out of flower, and be placed in the lightest part of the Cattleya-house. great care being taken not to afford water copiously, or growth instead of rest will ensue.

GRAMMATOPHYLLUM MULTIFLORUM, G. FENZ-LIANUM, AND G. F. MEASURESIANA.—Plants of these species, both those that have flowered and those which have not, will now show new breaks, and should be examined as to the available rooting space. Teak baskets are preferable to pots for these plants, and the baskets should be comparatively small, as these species do not succeed if there is much material about the roots, being chiefly aërial. The compost should consist of fibry peat, with all of the soil sifted out of it, and a handful of clean crocks mixed with it, which press firmly around the base of the plant, and prick in a few heads of live sphagnum-moss. Growers commonly water these plants too frequently at the beginning of their season's growth, and, as in the case of Catasetums, Cycnoches, the deciduous Calanthes, &c., their young growths rot as a consequence. Special care is needed in affording water, and it is sufficient at first to merely sprinkle the baskets with a fine rose can till new roots form and new growths appear. Hang the plants in the Cattleya-house till they get re-established, when more heat, light, and mo'sture may be afforded.

THE KITCHEN GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

BROCCOLI.—It is now time in most localities that the mid-season and late varieties of Broecoli should be planted; but in very warm localities planting may be left till the end of the present month, care being taken not to crowd the plants in the seed or nursery beds. It is a good practice where land is plentiful to make two or more plantings of Broccoli, and to sow or plant in different aspects; the more open and exposed, the better the plants endure frost. I usually clear off a Strawberry-bed early in this month, and plant with Broecoli, without digging the ground, but hoeing it, and raking off the weeds and rubbish. Before setting out the plants, drills are chopped out with the hoe or spade to about 3 inches in depth, and if the ground is too hard to allow of planting with the trowel or dibber, a crowbar is used to make the holes to receive the plants. Varieties of medium growth may stand at 2 feet apart each way, and strong growers at 24 feet.

ASPARAGUS.—Next year's success will largely depend on the kind of treatment afforded during the next two months. It should be borne in mind that if land is allowed to become overrun with weeds, strong crowns will not form, and the shoots next year will be correspondingly weak. It is essential that the season's growth should be strong, and means should be taken to assist it by liquid manure applied once in fourteen days, and dressings of salt and artificial manure. The stems should be supported in some kind of way, either with short-sprayed Pea-sticks stuck in around the stems, or by running lines of soft string along the rows at 2½ to 3 feet from the ground, and securing the stems to these. If dry weather continue, afford water to the plants before and after applying the salt, &c.

PEAS.—Although it is too late for sowing late Peas, early ones may still be sown. It is my practice to sow this last succession on a warm border, giving the preference to a dwarf variety of the Chelsea Gem type of Pea, such being easily protected from small birds with netting. Drills should be made of 6 inches in depth, and the seed covered to a depth of 3 inches, which leaves a shallow trench to hold water, and a mulch, if this last be necessary, but which may not be afforded before the Peas are 6 inches above ground. Al the mid-scason and late Peas should be mulched and the ground well watered, appearances indicating a continuation of the dry weather, otherwise the crops will be light, especially on light soils. The mulch may consist of long or short manure, partly decayed leaves, even dry Bracken may be used, but lawn-mowings may only be used if all other materials fail. One good watering and a heavy mulch applied directly afterwards, is more beneficial than two waterings alone.

VARIOUS.—Herbs coming into flower should be cut and spread out to dry slowly in a shed; and in any case a portion of each bed should be cut, if only to promote young growth, and the better wintering of the plants. Cut away the flower-spikes from Sorrel. Continue to plant out Cauliflowers for autumn use; also Vegetable Marrows in spure corners, or in Potato pits, and frames. The lights will not be required. Radish seed should be sown frequently in the coolest part of the garden; when once ready they last but a few days, usable during hot weather, and these and saladings must be abundantly watered.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

PINE-APPLES. - As soon as a batch of strong suckers is obtainable, preparations for potting should be made, so that solar-heat may be utilised in affording them a good start. A steady bottom-heat not exceeding 95 will be required, and this is best provided by a bed of fermenting material, consisting of Oak or Beech leaves mixed with a small quantity of fresh stable litter. For potting-soil, use a rich fibrous loam, torn in pieces by the hand, pressing it firmly into the pots (which should be 5 or 6-inch ones for the largest suckers), and making it very firm round the base of the suckers, as doing this tends to speedier formation of roots, and sturdy foliage. Afford one thorough watering, to settle the soil, and keep the frame rather close and moist till the emission of roots has commenced, is determinable by growth commoneing in the leaves. At this stage the plants should be inured to more light and a freer circulation of air, when the ordinary When the pinery treatment should be given them. roots reach the sides of the pots, and before they become pot-bound, a shift should be afforded them,

using a rather fresh fibrous loam, torn up roughly, discarding the finer particles; a fair sprinkling of bone-meal, and charcoal if the loam be clayey. The pots used should be either new ones that have been immersed in water for a few hours, or quite clean old ones, and pot firmly.

PEACHES AND NECTARINES, EARLIEST-FORCED. See that the excliest-forced trees get abundant root-waterings, and syringing morning and evening, se as to preserve the foliage fresh as long as possible. If the upper lights of the Peach-house are removable, they should now be taken off, so as to expose the trees to the weather. Pot-trees from which the fruit has been taken may be placed in an open situation out of doors, sheltering the pots from the direct action of the sun by plunging them in the soil or in other pots, &c. As the succession trees are cleared of their fruits, much of the old bearing wood should be cut away, and the growths thinned where crowded; use the syringe freely to cleanse the foliage. and maintain the borders in a thoroughly moist state. Should the wood be weak, and the trees show signs of exhaustion from overcropping or other causes, liquid-manure should be applied, and the wood well exposed to the light, and the foliage made healthy, so that the buds will be enabled to develop properly and strongly. The lateral or side shoots should be stopped at the first joint, unless the buds are in an advanced state, in which case lateral growth may be allowed to develop for a time. with fruits now swelling should have their shoots stopped, tying back such of them as obstruct direct sun from reaching the fruits Keep the borders moist, and mulch them with half-decayed stable-minure. As an arid atmosphere is not desirable, even in a house with ripening fruit, available surfaces should be damped two or three times a day during hot weather. Afford plenty of ventilation during the day, and sufficient at night to ensure a due circulation of the air.

UNHEATED HOUSES.—The trees in these houses will in most cases have finished stoning, and the final thinning may now take place, unless the trees are young and of great vigour. Apply liquid-manure copiously to the roots, keep the shoots thun and secured to the trellis, drying the trees thoroughly merning and afternoon, except on wet or dull days, when the afternoon syringing may be dispensed with.

PLANTS UNDER GLASS.

By Jno. McInture, Gardener, Woodside, Dirlington.

THE CHRYSANTHEMUM .-- The latest will by this date have been shifted for the last time; backs" for forming bushes should have formed strong erowns; and all the plants will have been placed out-of-doors to finish their growth. The usual seasonable pressure being now past in the plant houses, more time will be at the disposal of the gardener for attending to the varied wants of his Chrysauthemum plants. From now onwards is a critical time with these plants, and if the gardener aims at great excellence, in whatever form his plants are grown, they should be carefully staked, and the stakes should be sufficiently tall that no shifting of stakes will become necessary. The plants should be placed in a sheltered yet open position, arranging them in straight lines on a bottom of coal-ashes, or if the walks in the kitchen garden are asphalted, they can be stood on these without anything else beneath them. Our plants ripen their wood and produce finer blooms stood on asphalte than on any other miterial. It is a good arrangement to have strong posts permanently fixed, and furnished with rows of galvanised iron wire, to which the plants, or rather the stakes, may be fastened. Earwigs commit much havoc in the summer months, and the Chrysanthemum grower must pay close attention to the work of catching them by hand. The bush-plants, if time permits. should now be staked, but passing green thread through the crown, so as to keep the shoots in proper order. Done in this manner, bushes do not become a bundle of sticks, and they have a natural appearance. Side-shoots will need removal to throw the energies of the plant into the main-stems, and the production of flower-buds. No hard-and-fast line can be laid down to suit all varieties in regard to the most suitable time to "take the buds," grower must determine this matter for himself. Some few varieties produce the best blooms on the terminal bud; but in the greater number of varieties the finest flowers come from crown-buds, and experience alone can determine this point. In this garden we begin to take the buds in the first week in August, and in the second week in September, and

buds obtained later than this may turn to passable blooms, but they are of no use on the exhibition-tible. If no exhibition-blooms are required, the best system to my mind is to grow three plants in one pot, cut them back at the end of the month of May, and allow three breaks to form on each plant—that is, nine shoots in all. From these take the terminal buds, and you will have nine fine flowers on each specimen, and the latter will he sufficiently large enough for most purposes, being dwarf in stature. If the plants were potted into sound materials they should not be afforded manure till the soil is getting exhausted of its fertility. I afford manurial aids from the time of taking the buds till the flowers are about to expand. A collection of Chrysanthemums should be examined as to the state of the soil as regards moisture morning and evening, a serious check being given them by lack of water at the roots. Aphis must be rigorously kept in check with tobazco-powder

MISCELLANEOUS.—At this season regular and constant attention should be given to keeping the various houses neat and the plants clean, and the arrangement occasionally changed in so far as regards the smaller portable plants. Do not allow seed to from on Fuchsia and Pelargonium plants, as it is bad for the plants, and gives them an uncared-for appearance.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

APPLE AND PEAR TREES .- The chief work in the fruit garden which will now require considerable attention consists in the pruning of the bush, cordon, pyramid, and trained Apple and Pear-trees, taking the early varieties first, thinning the fruit if it be too abundant, and affording them water copiously, with addentately an application of manure-water to trees that may be carrying full crops; those trees which have little or no fruit, and growing strongly, having only clear water. When pruning the trees a sharp search should be made for insects injurious to fruit and leaves. The woolly aphis (American blight) on the bark of old and young shouts and rootstock of the Apple; and the coccoons and webs of the small Ermine-moth (Yponomenta padella among The woolly aphis (American blight) on the foliage of the Apple, the larvæ of the slug-worm on the leaves, and the coccoons of the Woodleopard moth on the folinge and among the branches of the Peir, are common pest. In the case of webs and coccouns, the simplest method of ridding the trees of them is to collect and burn them, and even the smaller infested shoots along with them, if of small account. Little can be done at this season tokill American blight or the mussel-scale, beyond the application of supposed and clear water applied with the gardenengine. Winter is the proper season for applying means for their destruction; and I would direct the reader's attention to former Calendars for information Pear and Cherry trees on which the on this subject. larvæ of the sawily are found should be marked for treatment in the winter, at which season the surfacesoil under the trees to a depth of 4 inches may be removed and charred, or deeply buried in the kitchen garden - in this way destroying the pupu. generally winters just below the surface of the soil. The roots should be covered with fresh soil.

PLUMS.—These trees are in general carrying a fair crop of fruit, with the exception of one or two varieties, as Denyer's Victoria, and Jefferson, which have set heavy crops, requiring to be rather severely thinned.

PEACHES, NECTARINES AND MORELLO CHERRIES will require constant attention in the matter of laying in the young shoots for extending the area of the tree, and fruiting. The upper portion of these trees should have the first attention, the partial demulation of shoots diverting the sap to the branches in the lower half—very necessary indeed where glass copings are allowed to remain over the trees during the summer season, which tend to develop much growth at the top of the trees. Although we have had in this locality some refreshing rains, still a very insufficient quantity has fallen on the borders, which are near to high walls, and heavy applications of water to the roots of fruit trees are very necessary. The fruits of some of the early varieties of the Peach are approaching the end of the final swelling, and these should be well exposed to the sun. In doing this do not cut off or mutilate the leaves, but secure them with twigs for the time being.

APRICOTS.—These fruits are likewise approaching ripeness, requiring the same attention. Let all

syringing cease of these trees whose fruit is getting ripe.

PRESERVE-FRUITS.—Attend to the gathering of fruits of all kinds for preserving purposes, according as it becomes fit for this kind of use, choosing a time when it is quite dry, and endeavouring to have it gathered early enough to allow of the work connected with boiling-up, &c., being undertaken the same day. The Strawberry-nets can now be used for the guarding of red, white, and black Currants. Continue to layer Strawberry-runners in pots or otherwise for forming new plantations, keeping the runners supplied with water if the weather be hot and dry.

THE FLOWER GARDEN.

By HEDLEY WARREN, Gardener, Aston Clinton, Tring

HINTS ON WORK IN CENERAL.—In weather favourable for weeding and rolling walks, that is, when showers have softened the surface, this job should receive attention. In shrubberies the removal of decaying matter, foliage, and flower-stems should be attended to. The mowing of grass lawns is at the present time work that cannot be slighted, if a close velvety turf is looked for. Climbing Roses and other similar subjects will often stand in need of the best wood being slightly secured against wind and rain, and the weak and superfluous shoots removed. It adds greatly to the good appearance of the waning glories of the Rose-beds if all dealor decaying flowers be gathered off the plants daily. The beds and borders of Roses may require a thorough soaking with clear water.

BEDDING PLANTS .- These plants, now beginning to grow freely, will require, in some cases, to get close to the soil by pegging down the side shoots, a matter that should have early attention, so that the beds may the sooner be furnished, and the ground e wered. Verbenas, Calceolarias, Violas, and Petu-nias should be well supplied with moisture at the roots, otherwise their period of flowering will be curt ded. If such plants get exhausted, the removal of all seed vessels and decaying flowers, and a thorough application of water to the soil, will usually re-invigorate them. Carpet plants should occasionally have the unnecessary growths removed, and be pressed level, taking great care to keep the figures accurately defined by trimming and removing encroaching shoots. Succulents are much benefited if the flower-buds are removed as soon as they are the flower-buds are removed as soon as they are discernible. Mentha Pulegium, Veronics, and similar spreading plants are kept within bounds by clipping them with a pair of sheep shears. In many instances Pyrethrum parthenifolium aureum is throw ing up flowering stems, which should be removed, entirely keeping the plants dwarf, and yet fresh-looking. Abutilons, Castor Oils, Solanums, "Tolooking. Abutilons, Castor Oils. Solanums, "To-baccos," and other subtropical plants should be securely fastened to stikes as stem-growth progresses. or much damage may be done by win l. Flowerbeds are not unfrequently seen which contain too many plants, the outcome of a desire to make in mediate effects, or because the nature of the soil has not been considered, a strong retentive soil, if carly rich, producing a luxuriant growth at the expense of bloom. Much of this flowerless luxuriant riance might be obviated by planting less thickly, or by thinning out much of the superfluous growth at intervals during the summer. Antirrhinums have proved to be excellent plants in a dry season like the present, affording a wealth of bloom for a long time, with more to follow. Tropæolums are doing finely, making sturdy growth, notwith-tanding the drought As a dwarf variety of Tropæolum, Mrs. Clibran proves to he a very valuable plant, its bright yellow flowers showing up well. It is a variety that will in many places take the place of the yellow Violas and Calceolarias, and where these plants do not succeed I would certainly recommend a trial of the variety.

CANNAS. — The Gladiolus flowered type is gaining favour as a pot plant, and as a bedder. The plants should be grown in warm spots, the beds should be very well drained, and liquid-manure freely used after the flower-spikes appear. When Cannas are raised from seed, the same should he sown as soon as ripe; when large enough, pottog off the seedlings singly, and keeping them growing in a warm-house all the winter. Under this kind of treatment Cannas make strong flowering plants by the spring.

MR. J. IRELAND.—We are informed by Mr. Ireland that he has resigned his post of Orchid-grower and Foreman at Messrs. J. Cowan & Co.'s Nursery, Garston, Liverpool, and he is looking out for a situation commensurate with his abilities and knowledge of Orchids and general nursery work.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a quarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for a production in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will groutly oblige by sending to the Editor early intelligence of local events likely to be of intenst to our readers, or of any matters which it is desirable to bring under the natice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, JULY 14

Meeting of the Fruit and Floral Committees of the Royal Horticultural Society, Drill Hall, James Street, Westminster, Lecture by the Rev. J. H. Pemberton on New Roses.

SHOWS.

TUESDAY, J

July 14 Royal Horticultural Society's Stecial Rose Show, at Drill Hall (Competitive).

WEDNESDAY, JULY 15 (Clverston Rose National Rose Society Royal Botunic Society Promenade, Geneva (six days).

THURSDAY, JULY 16 Rose and Hortcultural Shows at Halifax, Selby, and Finehley. Jursey Summer Exhibition.

SATURDAY, JULY 18-New Brighton Rose Show.

SALE.

FRIDAY,

July 17 (Imported and Established Orchids, at Protheroe & Morris' Rooms,

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -63°.4.

WE hear and see a great deal of Sports in the plant variation, and are often called on to make comment upon it. It does not happen, however, that the subject is made the object of a law suit so often as might be expected, and hence the case we have now to refer to is the more interesting. It appears from the report in the current number of the Revue de l'Horticulture Belge, that a difference of opinion arose between M. VINCKE and Messrs. Sander & Co. as to the price paid by the latter for a plant of Cypripedium Harrisianum x. This plant was the first hybrid Cypripedium raised in this country. Its parents were C. villosum and C. barbatum. In course of time numerous variations have made their appearance, differing from the original Harrisianum, and excelling it in attractiveness. These characteristics unfortunately are not always stable, the fine variety of one year may degenerate in the next season to an ordinary form of C. Harrisianum x, or to something not so good. This variation is very interesting to the botanist, but it is evident that the amateurs and the dealers in Orchids may look upon it in a very different light. Thus when Messrs, Sander & Co. saw in bloom a fine variety of Harrisianum in the possession of M. VINCKE, they purchased it, but the next year, when the plant produced flowers of an ordinary or inferior character, they were auxious, according to what is alleged to be the custom of the trade, to have the money refunded. The case was tried before the Tribunal of Commerce of Bruges, and from the summary of the proceedings given in our contemporary we translate the following particulars:—

The action (between M. VINCKE, plaintiff, and Messrs. Sander & Co., defendants) related to the price of a plant of Cypripedium Harrisianum X, which the defendants alleged that they had bought for the sum of 1000 francs, only on account of the peculiarities of colouring which the flower displayed. They said that the seller of an article ought to guarantee the existence of the special characteristics, which caused the sale to be effected, and that, the year after the sale, if the plant no longer boro a similar bloom, restitution should be made, as is the custom of the trade in dealing with Orchids. The plaintiff replied that there could be no special guarantee, that the plant had been bought in flower as it stood, and he denied the alleged custom of the trade.

The tribunal gave a verdict for the plaintiff, the costs to be paid by the defendants. "Whereas the defendants bought the plant in the state under which it was offered, without any stipulation or special guarantee, especially as to the production of similar bloom at the next flowering season; whereas, if it be shown that the plant did not again produce the same [a similar] flower to that it bore on the day of the sale, that fact would not nullify nor cancel the sale; that, in fact, the plaintiff parted with the plant under the conditions stated by the defendants, and without guarantee as to the fixity of the colour or the tint of the bloom; that there was therefore no positive mistake to annul the contract, nor concealment which justifies cancelling, but simply a circumstance, often happening in Orchid culture, that is, the occurrence of variation in the flowering; whereas, the defendants who are Orchid importers, must be acquainted with these possible variations, and that this being the case, if they had desired to protect themselves in case of such an event, they should have stipulated in special terms, or effected a conditional purchase. As to the custom of the trade, which the plaintiff considered had reference only to the sale of Orchids not in bloom, the tribunal passed the matter over as not being proved, and as not affecting arrangements made between the parties.

All plants are liable to vary, some much more than others. Hybrid productions and their descendants are specially prone to vary. These facts are of course perfectly well known to trade-growers, and it would be an impertinence for outsiders to attempt to interfere with recognised and legitimate trade-customs. The purchaser in this case, as we understand, bought the plant telle quelle, just as it was, and without any guarantee of persistence. The Belgian tribunal has asserted, that in the absence of any such specific guarantee, the purchaser cannot recover if the plant becomes sportive. In these days of "hybrids" and "sports," and the great extension of commerce in such productions, it would be well if the trade could come to some definite understanding for the avoidance of disputes. Of course, the application is not confined to Orchids. Chrysanthemums, Roses, and other commercial commodities are just as variable in their way, if not more so. We should be glad to hear the opinion, alike of hybridists and of merchants, upon a point of great importance to both.

Varieties of Canna indica.

THE new varieties of Canna are beautiful things in the flower-conden but outling will not

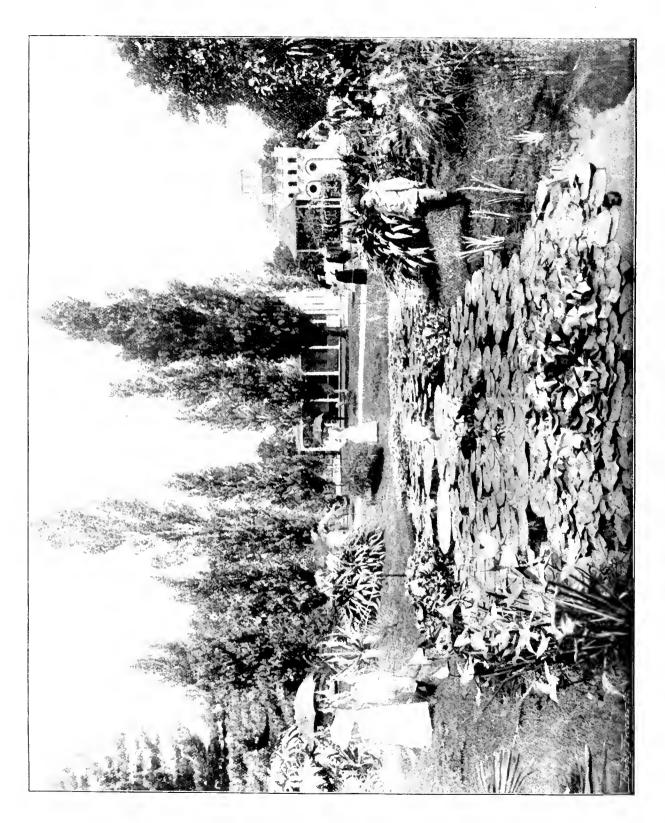

garden, but cultivators will not get the utmost ont of them that they are capable of unless special preparations are made for them. Merely to dig the ground after manuring it is not enough. It should be remembered that the Canna is a native of the tropics, and can only be relied upon to flower well in the warmest of summers when some endeavours are made to imitate tropical conditions. The first of these is warmth of soil, and this can be obtained in a modified degree by putting, say, a bed of $1\frac{1}{2}$ foot thick of fermenting materials, consisting of two-thirds last year's Oak or Beech leaves, and one-third short stable-litter, treading the mass fairly firmly together. This affords warmth and drainage, but failing the leaves and dung, their place may be taken with furnace-clinkers, brickbats, &c., to the depth of a foot, putting a layer of rotten dung, 6 inches thick, on the top of these. The spot chosen for the Cannas should be the hottest in the garden (at the foot of a south wall if cut blooms are looked for), and the plants should stand at least 2 to 3 feet as under, according to strength, so that the sun may reach them all round, and the soil; mulching in our climate does harm, in preventing the sun-heat penetrating the soil, and its place should be taken by a bi-weekly stirring of the soil to aërate it, and provent the loss of moisture, a crumbly surface doing this almost as effectually as a mulch. The rest is a matter of water and liquid-manure. The foliage should not be wetted at night, but about seven in the morning if the previous day was hot and it is likely to be so the next. If the bare appearance of the soil in the early stages of growth be not liked, put around the bed a row of Aralia papyrifera (Chinese Rice-paper plant), A. Sieboldi, Farfugium grande, a dwarf Solanum, or some of the taller varieties of tuberous Begonias-now, we fear, almost lost to gardens, but which are as graceful as a Fuchsia.

TOWER GROVE PARK (see Supplementary Itlustration).-We have had frequent occasion to mention the beautiful garden and botanical Institute bequeathed to the town of St. Louis by the late Mr. Shaw, an Englishman by birth, an American by adoption. By his intimate relations with the late Drs. Engelmann and Asa Gray, he had become acquainted with the requirements of Horticulture and Botany, and did his best to supply them. Dr. TRELEASE is now the head of the establishment, which has rapidly become one of the most important establishments of its kind. American journals report that great damage was done to the garden by the tate cyclone, but our promised report has not yet arrived. We shall take an early opportunity of alluding to the subject again.

HORTICULTURAL CLUB.—The annual excursion of the elub, to which ladies are especialty invited, will take place on Thursday, July 30, under the superintendence of Mr. HARRY J. VEITCH, who has kindly consented to make all the arrangements. The members will meet in the waiting room at Euston Station, London & North - Western Railway, at 9.50 A.M., and will proceed vid Bletchley by the 10.10 A.M. train to Leighton, where breaks will be in waiting to convey them to Ascott, the seat of Mr. LEOPOLD DE ROTHSCHILD, who has most kindly invited the members to luncheon; they will then drive across Buckinghamshire, twelve miles, to Halton, the seat of Mr. A. DE ROTHSCHILD, where they are invited to partake of tea and light refreshments, returning to town from Wendover Station at 7.55 P.M.

NATIONAL CHRYSANTHEMUM SOCIETY'S ANNUAL OUTING.—Mr. R. DEAN, Hon. Sec., Ealing,

t		
	¥	
	1	

AQUATIC GARDEN, TOWER GROVE PARK, ST. LOUIS, MISSOURI,

requests us to announce that the annual pic-nic and outing will take place on Monday, July 20 next. The menibers will travel to Elstree Station by the Midland Railway, to visit the gardens and grounds of Aldenbam House, Elstree, by the kind permission of Lord ALDENHAM. His lordship has granted permission to members to fish in the lake, and, provided the family are not in residence, permission also to play lawn tennis in the tennis-courts, but those desirous of playing must take their racquets. There will also be ample provision for cricket. Dinner and tea will be provided in a spacious marquee on the lawn. As this is certain to be a popular trip, early application must be made for tickets, so that necessary arrangements may be made. Members must state whether they require tickets from Mansion House or St. Pancras, so that ample accommodation may be provided.

THE GARDENERS' ORPHAN FUND is benefited by many means, and we are glad to hear that in connection with the Croydon Rose Show the efforts made by well-wishers and supporters of the Fund were rewarded to the amount of £7 10s. Not more than 10s. of this, Mr. Cummins informs us, is likely to be required to cover the expenses. At other shows a'Rose-fair in aid of the Fund might do similar service to "our orphans."

OUTING OF THE FOREST-GATE AND STRATFORD AMATEUR CHRYSANTHEMUM SOCIETY.—Mr. W. A. STURROCK, the Hon. Sec. of this Society, desires to inform our readers that the annual excursion of members and friends (ladies invited) will take place on our day of issue to Easton Lodge, Dunmow, by kind permission of the Countess of Warwick. The train leaves Liverpool Street at half-past 2 r.m., arriving at Dunmow at twenty-five minutes past 3 r.m. The Countess has arranged to drive the members to Bishop's Stortford Station in time to catch the eighteen minutes past 10 r.m. train for Liverpool Street.

ROYAL HORTICULTURAL SOCIETY.—The next Frnit and Floral and Scientific Meetings of the Royal Horticultural Society will be held on Tuesday, July 14, in the Drill Hall, James Street, Westminster, 1 to 5 P.M. Special prizes will be offered for lloses. At 3 o'clock a lecture will be given by the Rev. J. H. PEMBERION on "New Roses."

WOBURN FRUIT FARM.—We are asked to state that Mr. Spencer Pickering will be very pleased to meet any horticulturists at the Woburn Experimental Fruit Farm, Ridgmont, on L. & N. W. Ry.. on either the 20th or the 24th of this month. Visitors are requested to send a notice of their intentions to Mr. Pickering, Harpenden, Herts, not less than three days before their proposed visit.

THE BRITISH PRODUCE SUPPLY ASSOCIA-TION .- The association has been formed in order to bring the growers of British produce into direct relation with consumers, especially in large towns. It is proposed to open the central depôt for business on October 1, 1896. The association will either deal through tradesmen, or it will deliver to customers direct. In either case, all goods will bear the brand and trade mark of the association, so that purchasers will have an absolute guarantee both of origin and quality. Eventually it is hoped to deal in all kinds of British produce, but at first the following will be obtainable: Meat, poultry, game, hams, bacon, eggs, cheese, butter, tongues, sausages, fruit, vegetables, flowers, jams, preserves, pickles, &c. All sales will be for cash with order, or on delivery, but deposit accounts may be opened. By dealing with the association great encouragement may be given, and help afforded to farmers and others who grow British produce; and, at the same time, a guarantee obtained that the article is really what it professes to be. It is not necessary to be a member of the association in order to deal with it. The Earl and Countess of WINCHELSEA held a reception at the depot Winchelsea House, Long Acre on Thursday, as these notes were passing through the press.

STOCK-TAKING FOR JUNE.—There is one reward for working away through a mass of figures such as those contained in the Board of Trade Returns for the past month, or any other period, which is that of proving that "our side" is right, that British enterprise and energy are receiving their reward, as is the case to-day, when we find the Imperial revenue of the past quarter exceeding that for the same period last year by nearly 13 millions, the increase being contributed to by all items on the sheet with only one exception—the "Estates column; and these Board of Trade Returns now under notice show an increase in imports amounting to £1,334,671 for the month of June, and the exports in excess of those for June of last year by exactly £2,729,953. But just here may be introduced the usual excerpt from the monthly summary table of imports for the past month :-

180%	1896.	Difference
€ 30,894,584	£ 35,229,355	€ +1,304,671
12,505,318	12,504,950	_90,362
1,551,788	1,606,000	+ 54,221
5,210,850	4,646,045	-373,832
3,676,176	4,490,017	4 822,841
1,213,218	1,216,702	+ 4., 454
70, 71	92,424	+22,653
	2,505,318 1,551,788 5,219,880 2,676,176 1,213,218	\$3,894,584 \$5,229,255 12,595,318 \$12,594,956 1,551,788 \$1,696,999 5,219,889 \$4,646,948 3,676,176 \$4,499,017 1,213,218 \$1,216,792

Whilst noting the imports of to-day, giving an eye to those of the future is allowable—this in connection with the terrible storms which have recently swept over the fair lands known as Sonthern Russia, which have torn up, or otherwise ruined the corn crops, vineyards, orehards, and Tobacco-lands; ruin remains where a month since plenty smiled. The accounts to hand of the wide-spread devastation are very pitiable, and we can only hope they have been exaggerated—at any rate, they form a factor in the estimate of expectations from that quarter of the globe. The figures relating to fruits, roots, and vegetables, are always of interest. The following partake of the old character:—

IMI	SORTS,		1895,	18:00.	Difference.
Fruits, raw	:				
Apples		loish	74,553	37,917	-12,6.9

By the way, we may just note here that the imports for the six months ending on the 30th ult., amount to £216,481,035, an increase of £12,793,335 for the same period of time last year. Turning to—

Exports,

we find these reach the sum of £20,530,053, showing an excess of £2,729,953 over the figures for June, 1895; the figures for the six months are given at £119,002,722, an increase of £12,885,206 in the same period last year. The only decrease recorded in the month is £315 in raw materials—there is no decrease whatever in the six months record.

CARNATIONS.—A large quantity of excellent blooms, cut with the entire stems, come from Mr. A. PENTNEY, Worton Hall Gardens, Isleworth. The finest were Leander, Yellow Queen, and Germania, yellow-coloured varieties, the first two named from plants growing in pots: Mary Godfrey, a perfect wall or tree variety, white. With flowers not quite so fine

as these, were Queen of Bedders, purple in colour, with robust growth, and very free; Countess of Paris, blush-coloured border variety; Border Maid, very floriferous, colour cerise; Rose of Rutland, and Ketton Rose, two famous varieties for the border, of two different shades of pink.

ROYAL BOTANIC SOCIETY,—The experimental series of musical promenades in the Regent's Park Gardens on Saturday afternoons have proved so successful, and have been so largely attended by the publicand the Fellows, that a resolution will be brought forward at the Fellows' meeting on Saturday next in favour of continuing the promenades until further notice. The suggestion made at the last meeting, that recognised societies and institutions should be encouraged to hold receptions and garden parties in the gardens is already being acted upon—the Council of "The Salon" having arranged to give a Reception on the 15th inst.

ROSES AT THE NATIONAL ROSE SOCIETY'S recent exhibition of the National Rose Society at the Crystal Palace, writes Mr. EDWARD MAWLEY, Hon. Secretary of the Society, may be of interest to some of the readers of the Gardeners' Chronicle. Owing to the trying nature of the weather, and the extremely forward season, the number of blooms of exhibition Roses staged in competition was 5064, or nearly 800 less than the average for the eight previous metropolitan shows of the Society, and less than at any of the last twelve exhibitions except 1893. England Scotland, and Ireland were all represented, and for the first time a Scotch firm competed for the Nurservmen's Champion Challenge Trophy. Roses came from no fewer than twenty one different English counties while the total number of exhibitors amounted to seventy-three, sixty-one of whom were prize winners.

THE CARNATION AND ITS CULTURE in pots and borders formed the subject of a paper delivered by Mr. J. Davis before the St. Barnabas, Sutten, Carshalton, and District Cottage Gardeners' Society on the 3rd inst. This new society is likely to do much good in the neighbourhood it is intended to serve.

UTRECHT. — Dr. WEST has been appointed Director of the Botanic Gardens at Utrecht.

NURSERYMEN'S PICNIC.—The employe's of Messrs. W. P. LAIRD & SINCLAIR, Dundee, held their annual picnic on Wednesday, July 1. The party, in number over sixty, drove in brakes to Kinelaven Castle, where a very pleasant day was spent in good weather. The whole of the expenses were defrayed by the firm.

TROPÆOLUM SPECIOSUM has proved itself very difficult of cultivation in most southern gardens, especially upon south walls. An instance to the contrary we have had recently the opportunity of noticing in the gardens at Dover House, Rochampton. Mr. McLeon has planted it in four places at the foot of a wall there having a south aspect. All of them are doing well, and one in particular is exceedingly bright at the present time, with hundreds of its brilliant blossoms. They were not planted in the staple soil, but in loam.

GLADIOLUS KONIGIN [QUEEN] WILHELMINA. -Messrs, Krelage have kindly sent us from Haarlem flowers of this novelty, a coloured plate of which is given in a recent number of the Tijdschrift voor Tuinbouw. The spikes are many-flowered, the flowers facing one way, and of moderate size. The three upper segments of the perianth are broadly oblongacute, pale flesh-coloured; the three lower segments are narrower, of a similar ground-colour, but marked in the centre with a very pale yellow spatulate blotch, surrounded by a distinct rosy-carmine band, extending nearly the whole length of the petal. The throat of the flower is also marked internally with a pale reddish-orange blotch. Messrs. Krelage describe it as an early, free-flowering variety, well adapted for cutting. To those who may chance to see only the coloured plate, we may say that it gives but a poor representation of the elegance of the flower, and purity of its colour.

"BOTANICAL MAGAZINE."—Some plants of unusual interest are figure 1 in the present number. Among them are:—

Lowya campanulata, Baillon, t. 7482.—This is a plant like an Aspidistra, but with racemes of pale yellow flowers, which are succeeded by ovoid blue-berries, about 1 inch in length. It belongs to the tribe Ophiopogeneæ of Hæmadoraceæ, and is a plant certain to interest the plant-lover.

Pilocarpus Jaborandi, Holmes, t. 7483, is a Rutaceous tree, the leaves of which are used medicinally to promote the secretion of saliva. It is a native of Pernambuco.

Aspidistra typica, Baillon, t. 7484.—A native of Tonkin, differing from its congeners in having the parts of the flower in three instead of in fours.

Akebia lobata, Decaise, t. 7485.—A Japanese species occurring also in China, and differing from the old A. quinata in having the lobes of the leaves creaated, and in the smaller flowers.

Hæmaria Dawsmiana, Hook. fil., t. 7486, better known in gardens as Ancestochilus Dawsonianus; see Govd. Chron., 1868, p. 1038.

PHENOLOGICAL REPORT FOR 1895.-The Report on the Phenological Observations for 1895, by Mr. EDWARD MANUEY, from the Quarterly Journal of the Royal Meteorological Society (April, 1896), is now to hand. Over a hundred observers in different districts of Great Britain contributed their notes on the climate and its effects on vegetation and on animal life, and these, collated into tabular form, are here presented. Making due allowance for varying localities, the general climatic conditions during 1895 were, stated briefly, the following-a very cold winter, followed by a dry spring and early summer :- "The yield of all the firm crops, except Potatos, was exceedingly poor. The one redeeming feature of the year, from an agricultural point of view, was the antumn, the glorins weather of which greatly favoured the completion of the harvest, the growth of the grass and roots, and the cultivation of the land. As regards vegetation generally, seldom did a year end under conditions so favourable for the one succeeding it."

THE RASPBERRY SUPERLATIVE.—Our correspondent and writer of Calendarial articles, Mr. G. Woodgate, the gardener at Rolleston Hall, Burton-on-Trent, in sending a few fruits of the varieties of Superlative Raspberry for inspection, states that "it is one of the best for dessert or culinary uses. The canes continue to bear fruits for a long period of time, and in warm years the current senson's canes bear fruits freely. Last season good fruit in quantity was picked from July 5 till September 7. This year he began to pick for preserving 55 lb on July 1. The canes are robust, and average about 7 feet in height." The fruits sent were fine specimens, but they arrived mostly in a state of pulp.

"LE JARDIN DU CREST."-In a handsome volume of over 200 pages, M. MARC MICHELI has published a list of the plants cultivated in the open air in his beautiful garden near Geneva. About 2000 species are cultivated, 1300 of which are Dicotyledons, and 700 Monocotyledons. The plants are grown in beds and borders; the rarer ones are placed in pockets of slate, well drained, and in which the character of the soil can be adapted to suit the requirements of particular plants. These cau be covered in winter with glass or any protecting material, which can be removed in summer. Special arrangements are made for Ericaceous plants, succulents, and water plants. M. MICHELI enumerates thirty-three species of Tulipa, thirty-nine of Fritillary, twenty of Calochortus, whilst Irids are represented by no fewer than 250 species. Twenty-five per cent, of the plants are of European origin, 12 to 15 from Oriental sources; Central Asia and temperate Himalaya furnish each 5 per cent.; China and Japan, 10 per cent.; the United States supply 12 per cent., Mexico 6 per cent. From Australia and New Zealand come 3 per cent., and from South Africa 9 to 10 per cent. In his catalogue, which is arranged alphabetically, M. Michfeld gives first the name of the species, then the authority for it (a matter of detail generally omitted by horticulturists), the natural order, the reference to the book where the original description may be found, and indications of plates or other illustrations. The native country and the date of introduction are also meationed. In addition there are numerous short remarks betinical and cultural, which add greatly to the value of the work.

SWEET BRIARS AT BURFORD LODGE—"I litely saw a long line of Lord Penzince's Briars in Sir Trevor Lawrence's garden," remarks a correspondent, "the plants occupying a space against a wall, a position in which they grow and flower freely. A considerable range of colour was observed in the blossoms of these plants. Among them Janet's Pride was noticed, a variety exhibited by Messrs. Paul & Son, The Old Nurseries, Cheshant, and said to have been found in an old rectory garden—a chance seedling, probably. The Briars of Lord Penzance's raising are admirable acquisitions to all who possess a garden, and they should always find a place where the climatic conditions are favourable, the grateful fragrance of the foliage apart from the beauty of the bushes when smothered with blossoms sufficing to make them favourites.

WARMINSTER AMATEUR ROSE CLUB SHOW .--The twenty-eighth annual exhibition in connection with this club took place in the grounds attached to East End House, the gardens of which were thrown open to visitors. In spite of the adverse season, there was a meritorious collection of Roses. Prize list -First division, twenty-four distinct varieties of Roses, single blooms, 1st and Challenge Cup, Mr. S. P. Budd, Bath; 2nd. Rev. R. Powley, Upton Scudamore. Twelve distinct varieties of Roses, three blooms of each variety, 1st, Rev. R. Powley; 2nd, Mr. W. Chapman, Sambourne House. Twelve Roses, distinct varieties, single blooms, 1st, Rev. R. Powley; 2nd, Mr. J. Smith. East End House. Six Roses, Tea or Noisette, distinct varieties, single blooms, 1st, Rev. R. Powley: 2nd, Mr. Hinton. Second division, twelve Roses, distinct varieties, single blooms, 1st, Mr. S. Smith, Henford Cottage; 2nd, Mr. C. A. Bleeck, Manor House. Six varieties of garden Roses, Briar and any non-exhibition variety, not fewer than three bunches of each variety, 1st, Mr. S. Smith, There were many small classes for six Itoses, single Rose blooms, garden Roses, bouquets, Strawberries, for size and flavour, &c. Arrangement of Roses shown in a basket, 1st, Miss Chapman, Sambourne House. Arrangement of Roses shown in a vase, 1st. Miss Gillett.

YORKSHIRE NATURALISTS' UNION. -- The 125th meeting will be held at Roche Abbey, for the investigation of Maltby Common and Woods, on the present Saturday. We glean from the circular kindly forwarded by the Secretary, Mr. W. DENISON ROEBUCK, that through return tickets at pleasure-party rates will be issued at all stations on the G. N., H. & B., L. & Y., L. & N.W., M., S. & L., Midland, and N.E. Railways, which have booking arrangements for Rotherham or Masborough, to Members and Associate of the Y.N.U. producing their signed card of membership. Tickets taken on Friday or Saturday, July 10 or 11, will be available for return any day up to Tuesday, July 14. Members will find accomodation at the White Swan Inn, Maltby, and the Black Lion lan, Pirbeck. Private lodgings might also be obtained at some of the cottages in Maltby for a limited number of visitors desiring to prolong their stay for a few days. Permission to visit their properties has been kindly granted by the Earl of SCARBOROUGH and the Rev. H. G. JEBB, M.A., J.P., Firbeck Hall. The garden and grounds at Firbeck will be open for the inspection of the members. Books and maps:-The distriet for investigation is included in sheet 82 N.E.

1-inch Ordnance Map (also published geologically coloured, as also are the 6-inch sheets, 290 and 296). Reference may be made to Böller's list of plants given in Ausling's History of Roche Abbey.

PUBLICATIONS RECEIVED.—Strawberry Culture (the "Salisbury" series), Geo. Tocker, at the offices of The Fruit terower, Fruiterer, Florist, and Market Girliner, 2-5, Salisbury Court, Fleet Street, E.C.

ROSE GROWING IN INDIA.

"The first and most important point to be considered in making a rosary in India is the watering of the plants. Hand watering is useless. They must be flooded, and the well should be close at hand. Roses are thirsty, hungry things, and need lots of water, for they love to be kept cool at the root in the heat of summer.

To susure flooding with facility, the beds should be 3 inches below the general level, with a slight fall from the drain. Simplicity is much to be desired in the plan of a rosary. As an example of extreme simplicity, I mention a plan of the Rose garden I have made at Chuprah and Dinapore, which has answered admirably at each place. It consists of oblong beds, 2 feet wide, with grass-turfed walks 3 feet wide, between which are always green from the moisture they obtain from the flooding of the beds on either side. The beds can be made any length (and this will depend on the extent the water can be carried) on either side of the centre walk, which should not be less than 5 feet in width.

Another matter of importance is to have no trees in or near the resary, as the roots of large trees absorb the moisture, and throw shade, which is not desirable. All plants, both flower and vegetable, thrive best in the open.

Rose plants should be allowed to grow as they like, and make as much wood as possible during the rainy season, and should not be pruned until it is quite certain that the cold weather has set in, and this will entirely depend upon the place one is in. I used to prune in the beginning of October when I commenced Rose gardening, and learnt from experience that it was a mistake, as I found one year that the half of my plants which were pruned a fortnight later than the others flowered the best, and since then I have never pruned till the beginning of November, generally the 10th, which I consider the proper time in these parts. If the plants are pruned before tho cold weather has actually set in, a few days warm weather, which I have often known about the end of October, will scorch the new shoots. After pruning, I expose the roots till the new shoots are well out, and then fill in with well-sifted and decayed horse-manure, the older it is the better, and flood twice a week until the buds are well out and full, when watering should be discontinued. In the hot and dry weather the plants should be flooded at least three times a week.

I have found that opening the earth round the plants at least twice a week makes them grow more than anything; it allows the air and manure to get at the roots. The malee should not be allowed to break the clods opened with the 'kurpee,' but should let them remain as they are.

The greater the above attention is paid to the plants during the hot weather and rains, the greater will be the satisfaction in the cold weather."

This note was accompanied by a diagram, which we do not give, showing long, narrow beds arranged crosswise in an oblong area, with narrow, grassy, sunken alleys to serve as water-carriers, for the purpose of flooding the beds with water, just such as are found in water-meadows. A border skirted by a path runs all round, enclosing the whole. Hybrid perpetuds, light and dark-coloured varieties alternating, were planted in the inner heds, and Teas and Noisettes on the outer border.

"The drains can be covered from view by placing pots on them. The drains can be made for 2 annas a running-foot; all that is necessary is to lay one brick flat as a foundation, and two bricks on edge, and

merely point them. The plants in the square should be 4 feet apart. "A Few Hints on the Cultivation of Roses," by Major-ticerral J. May. From the Journal of the Agricultural and Horticultural Society of India, Vol. VI., Part 4, New Society

A GROUP OF RESEDA ALBA.

In the group depicted in fig. 11 is shown a number of plants of a species of Reseda as yet not common in gardens, though an old inhabitant. As will be seen, the flower-spikes are elevated on tall stalks, and they are much longer than those of Reseda odorata,

they are doing injury to seeds, buds, plants, &c., by clappers moved by the wind, if they have not a boy handy to do this for them: by hanging white threads over seedling plants in a small and tender stage; putting nets over the wall-fruit trees and bushes, and over the Gooseberry bushes also in the late winter and early spring; netting seeds in lines and beds, or hanging threads furnished with chicken's feathers over them. I was a gardener for more than thirty years, and mostly on estates abounding with woods, game coverts, shrubberies, &c., and beyond killing bullfinches at the season when these birds devour the buds of the Plum, Gooseberry, &c., and woodpigeons in the winter, when the Cabbages, Broccolis, &c., form desirable food for them. I made it a practice never to destroy small birds. My re-

I thought well and safely laid years ago, by recommending in his Calendar such barbarous practices, which I am positive are unnecessary, to say the least. The cracking of the berries is entirely owing to atmospheric conditions, and no checking of sap is required. If those who are troubled with cracking will always, from the time when the first berry commences to colour until ripe, maintain warmth in the pipes when the sun does not shine on the roof, and keep the top ventilators always unclosed, but regulated in accordance with outdoor conditions, he will have no next to bore the laterals. The object is to keep the atmosphere of the interior buoyant and in circulation; the warm pipes will do this if the warmed air is able to escape. Mr. Barron, in his Vines and Vine Calture.

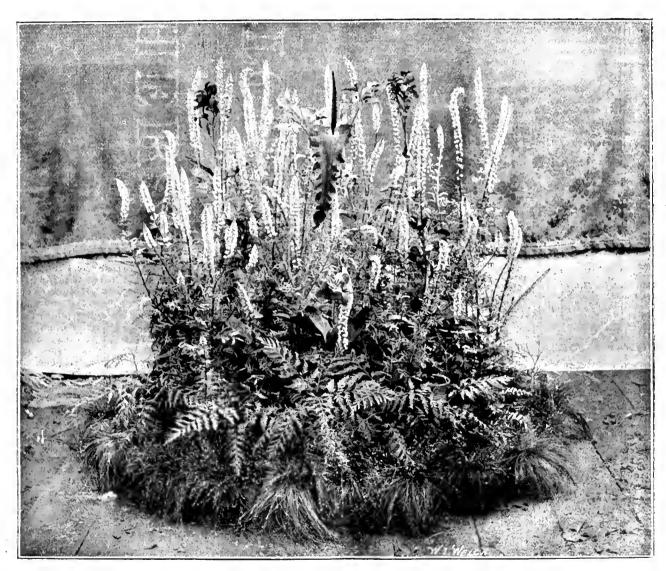

Fig. 11.— dot P + F P ANTS OF RESIDA ALBA, WITH FERNS AND GRASSES.

making the plant of much greater effect when employed in floral arrangements. We are indebted to the kindness of Messes. H. Cannell & Sons, Swanley, for the opportunity of figuring the plant.

HOME CORRESPONDENCE.

THE BIRDS AND THE GARDENER.—There is a great deal of nonsense being written by those who, having perhaps a mere patch of garden ground, would like to exterminate all the birds which are found therein, as they are believed to come, out of malice prepense, to devour the fruits of his labours. These owners of small gardens are, I fear, not very cognisant of the habits of the commonest of our wild birds, and so cannot distinguish their good deeds from those reputed bad ones. My advice to those much-plagued individuals is to scare the birds away when

ward was found in the comparative freedom of the gardens from vermin and insect plagues. I never killed an owl, hawk, crow, kestrel, or stoat, these being Nature's creatures, intended, as we may suppose, to keep rats, mice, voles, rabbits, &c, in due bounds: consequently the true gardener, who should know his friends, never kills them, although the gamekeeper does. The rook is sometimes troublesome in big kitchen gardens, and is a wary, artful bird; but he has a wholesome respect for a gun—if it really be one—only then. M.

MADRESFIELD COURT GRAPE. — An amateur friend of mine, who not only knows how to grow, but actually does grow and finish without a cracked berry, the above Grape, asks me whether Mr. Pope is in earnest when he recommends (p. 186 the boring of laterals as a sure preventive of splitting of the berries. My reply was that 1 am astonished to find a grower like Mr. Pope unearthing this bogey, which

says—"If allowed to hang long the berries are some what liable to crack," also "that it requires less heat than Black Hamburgh." These statements are not quite accurate, for it is well known eracking only takes place during its final swelling, and no amount of keeping will cause cracking. Win. Cranp., Madressiah! Court.

BRITISH HERBS AND THEIR USES—It appears to be an accepted fact, without any reason which I can discover, that certain herbs and berries, which are used to an enormous extent in this country, can only be grown abroad, and that no substitute equal to them is to be found here. I may take as familiar instances Tea, Coffee, Cocoa, and Maté or Paragnay Tea. Is it a fact that no plants grown in Britain contain the active principles of these in an equally agreeable form 'I very much doubt it. Take as an example the Paragnay Tea which, taken cold, is one of the most refreshing drinks in existence—do used of owe

English grown Hollies contain the same active minciples? It would appear probable that some, if not all, would be equal to the Paragnay Holly. The lifticulty is to test these; ours is a free country, and there are no slaves or bondsmen to experiment on. The average Briton considers himself too valuable to be used for experiments, especially where there is a thance of being poisoned, and losing his insurance aroney in the bargain. I can remember the time when our favourite Scarlet Ranner Beans were grown as an ornament in the flower garden, and the daring individual who risked his life by eating the pods, had yet to be made famous. No donot some of your readers will remember a similar experience with Tomatos. The person who first tried these not only risked eating the fruit of a plant helonging to a poisonous family, but his first bite must have been as astonishing as it was unpleasant. I remember my first bite at a Tomato, and why I ever tried another I am at a total loss to imagine—yet they have become both pleasant and desirable. The first expenditure of a valued threepence on a beautiful "Love-apple," whilst I was a small boy at school, and the first bite, is a memory which still causes internal qualms after a lapse of forty years. Thos. Fletcher, Grappenhall, Cheshire.

TOMATO DISEASE.—Like your correspondent, "J. B.," whose note I read in the Gardeners' Uhronicle for June 27, I have had some experience of this disease during recent years. I find that it only attacks the early plants, which are grown to fruit in May and June, and are more or less forced. In the later batches of Tomato plants I have never had disease, and have formed the opinion that it is caused by the atmospheric conditions, and not by applying bottom-heat. I would advise the discontinuance of overhead syringing as soon as the flowers begin to show, and to leave a moderate amount of top and bottom ventilation on during the night, so that the feliage is dry in the morning instead of dripping with moisture, as is the case if a house is closed in the disease gives no trouble. II'm. II'.

THE ALEXANDER PEACH.—It may be of interest to some of the readers of this journal to learn that ripe fruits of this early American variety were gathered on July 2 from a tree planted against a south wall. The fruits had not been hastened in any other manner than by the warnth of the wall. A. Methren, Bayham Abbey Gardens, Kent.

WELL-KEPT APPLES.—In reference to a note which appeared in your columns recently on the collection of Apples we exhibited at the Temple Show, allow us to state that they were kept in our new and enlarged fruit-house, on the open shelves, with a mat hung before them, since April. This fruit-house is on the same plan as that figured in the Gardeners' Chronicle at the time of the Pear Conference, and was fully described and particulars given for construction (by request) in the Report of the Royal Horticultural Society with papers read at the Crystal Palace, September, 1894. No artificial means were used to keep the fruit, care was taken to store fully-ripened fruit, and the floor being earthen the air is kept moist. Grarge Bunyard & Co., Maidstow.

SPARROWS .- It would be marvellous in our eyes -if it did not get there every day-that people who have merely read about a subject, should stand up as if they knew all about it) against those who have studied it with keen regard. Can such a man as Harrison Weir require confirmation upon a question which he has made so especially his own? Yet the ignorance of any sentimental child makes more impression on the public mind amount, perhaps, is the truer word—than the accurate knowledge of a great Little as I know, in comparison with him, every little is a help; and this I can say positively from my own observation), that sparrows are of very small service to us as against the race of caterpillars A few years ago, a triangular flower-plot (close to the window where I generally sit) was infested, I might say smothered, with thousands of semihairy caterpillars. I know their name as well as my own, but cannot stop to think about it now. Being touched up lately by some stuff similar to that which you air occasionally-though of course, you do it from politeness alone-1 kept close watch upon that grand supply of innumerable delicacies, offered gratis by benevolent—or pestilent—Nature to good birds. Good birds came, and hopped merrily among all this heaven-sent manna combining also the luscious wealth of the quail, and they never touched one of the sample. Sparrows there were by the dozen, robins also, and the gentle thrush, and the spry blackbird. I love birds, and watch them by the hour, and try not to grudge them their 50 per cent. of my fruit. Some of them are helpful in their way; but to talk as if they descended from heaven for our special benefit is, sir, in simple English, "rot." R. D. Blackmore.

DYOSPYROS.— The Persimmon (Diospyros virginiana) is perfectly hardy at Kew. There is a well-known specimen 60 feet high near the Temple of the Sun, at Kew, of which an account with an excellent portrait was given in the Gardeness Chronicle for November 3, 1888. It is unfortunately the staminate form, and therefore does not fruit. The European Date Palm (Diospyros Lotus) is equally hardy. It is represented by numerous specimens, of no great size at present, but one of these bears fruit tolerably freely. W. T. Thiselton-Dyer.

PHYLLOXERA RESTRICTIONS. - The present moment for approaching the Foreign Office to remove the disadvantages attending the trade of plants between England and Italy is most opportune. Owing to the entire failure of the Phylloxera laws to prevent the introduction or extension of the pest which unfortunately now prevails in, I believe, not less than 300 communes, from north to south, the Adriatic and Mediterranean shores, Sicily and Sardinia, the Italian Government has addressed the other signatories of the Berne Convention to so far abrogate the Phylloxera laws as to permit the free exchange of plants between them, with the sole exception of Vines. I have little doubt, therefore, that our Government would have no difficulty in obtaining the same conditions for English horticulturists. II. J. Ross. [We did our best at the Florence Congress and elsewhere to get these stupid laws abrogated or modified and have never ceased to protest against them, but we cannot say that at any time we received much encouragement from the English traders. Ep.]

VICOMTESSE HÉRICART DU THURY SYN. GARIBALDI STRAWBERRY .- Since the introduction of that valuable Strawberry, Vicomtesse Héricart du Thury, several attempts have been made to establish a supposed difference between it and the popular variety grown in Scotland under the name of "Garibaldi." The varieties so named have been cultivated side by side by many good growers within the past quarter of a century, and have invariably proved identical; and they are recognised as synonymous by Dr. Hogg in his Fruit Manual, by the Royal Horticultural Society, and by all the authorities on the culture of the Strawberry, who have investigated the subject, and given their opinion for the public benefit. However, in an interesting account given by Mr. D. T. Fish, at p. 5 of the Gardeners' Chronicle of the 4th inst., of the contents of Mr. William (not "John") Carmichael's garden at Edinburgh, it is stated—"The varieties here are true to name, and quite distinct; they were sent out in the same year as Garibaldi, by Dickson & Co., Edinburgh, and Vicontesse H. du Thury by Vilmorin of Paris." The same assertion is repeated on the next page in a quotation from Mr. Carmichael, who says:—"They are considered synonymous by many, but they are quite distinct, and both excellent preserving varieties of Strawherries, and very productive and good in flavour. Garibaldi is a week earlier, and dwarfer in foliage than Vicontesse H. du Thury." Mr. Mathieson, gardener at Meikleour House, l'enthshire, is named as furnishing corroborative evidence. There are here three gardeners of known repute making a definite statement as to the variety known as "Garibaldi," and that it is "quite distinct" from Vicomtesse Héricart du Thury. Mr. Carmichael pins his faith on Garibaldi being "quite distinct," because apparently in his garden it is a week earlier, and dwarfer in foliage, as above quoted. Granted that these differences exist in the small garden at Edinburgh (and there is no reason to doubt it), do they characterise the varieties when grown under they characterise the varieties when grown under ordinary circumstances, in all soils, and by various methods of culture! The general experience of the past quarter of a century answers "No." Could the doubt not be finally set at rest by Mr. Carmichael submitting his "quite distinct" varieties for trial in the Royal Horticultural Society's garden at Chiswick! Fragaria.

THE COMING FRUIT.

I have been asked more than once lately whether there is no fruit yet unknown to most English palates which might be introduced into this country, and form a pleasant article of food. As there seems to be some general interest in the subject, your readers may, perhaps, like to hear of some fruits which have come under my notice.

The Pumelow of India, one of the giant members of the Orange tribe, is well known to people who have lived in the East. Some very large specimens have been known to attain a circumference of more than two feet, and to weigh from fifteen to twenty pounds. Generally Pamelows are not held in high esteem in India and Ceylon, except by those who have lived long there, and know how to select the best sorts by their size and colour. The best Bombay Pumelows are said to be exceptionally good. They have a pink pulp of a juicy character, sweet in flavour. with a slight but agreeable bitter taste. The first Pumelows were brought to the West Indies by Captain Shaddock about 150 years ago. Since that time the fruit has always been known in that part of the world as the Shaddock, in compliment to the person who introduced it. Owing to circumstances of soil and climate, and to the raising of plants almost exclusively by seed, many varieties have sprung up that have become recognised by distinct names. Of the larger fruits, the Pumelow or Shaddock proper, there are two well-marked forms; the first is the Appleshaped Shaddock, usually with a whitish or a pale pink pulp; the other is a Pear-shaped fruit, with a pink, and sometimes a deep crimson pulp. Both these are large fruits, weighing from 3 to 6 lb. in weight: they have the characteristic pale yellow skin, and inside there is a white pithy layer more or less thick; then comes the pulp with the vesicles or juice-bags very prominent-indeed, the latter are so distinct that they can be easily separated the one from the other. The bitter flavour is very marked in the inferior sorts; in some instances it becomes quite acrid. The hest sorts have a sweetish flavour and only a slight taste of bitter. Of the smaller fruits, to which Macfadyen has given the name of Paradise fruits, there are in the West Indies two well-marked forms. The Apple-shaped fruits are known as Forbidden Fruit, while the Pear-shaped sorts are known as Barbados Grape-fruit. Both these are very attractive looking fruits; they have a pale yellow skin, usually very thin, are soft and silky to the touch, while the pulp is sweet and refreshing. The slightly bitter flavour is regarded as giving them tonic properties of great value in dyspepsia and allied ailments.

During the last fifteen years the Paradise fruits, generally known as Grape-fruit [!], have been in great demand in the United States. They have been very strongly recommended by the medical faculty, and in consequence their use has become an important feature in the diet of a large number of the American people. The consumption of them has increased by leaps and bounds, and every year for the past few vears it has more than doubled. A few days ago (says Garden and Forest) two barrels of small-sized Grape-fruit realised the extraordinary price of £5 each in New York; and seven barrels of similar fruit were sold in Philadelphia for £5 10s. each. Such fruit would retail at more than a dollar apiece. This is probably the highest price ever paid for specimens of the Orange tribe. It shows very clearly how keen is the demand for Grape-fruit, and what importance is attached to it as a refreshing and healthful adjunct to the foodsupply of the United States. At one time there was a better market for Grape-fruit-or, rather, Forbiddenfruit, as it was called-in the United Kingdom than in America. But the tables are now turned. America, especially since the destructive frosts in Florida, has now absorbed almost the whole supply from the West Indies. Sooner or later, however, English people will realise the special merits of the Grape-fruit, and a demand will arise for it, to the possible advantage of those West Indian Islands which are in a position to supply it. It would be well, therefore, for the people in that part of the world to establish small orchards of Grape-fruit trees of the best quality, and to be prepared to ship the fruit in such a condition that they may get the best price for it. This would be one way of alleviating, to some extent, the depression under which they are now suffering owing to the unremunerative character of the sugar industry. D. Morris.

PLANT NOTES.

FLOWERING OF AGAVE FEROX.*

A MAGNIFICENT specimen of this remurkable Agave is now in flower at La Mortola, when unfortunately (the season being over) scarcely a visitor is left to see it. As Mr. J. G. Baker says in his valuable handbook on the Amaryllideæ, the inflorescence of this species is unknown. I append a description in case none has yet appeared in print; and later I may be able to send you a photograph of this remarkable plant. Kurt Dinter. Curator, La Mortola, June 17, 1896.

NURSERY NOTES.

NEW EARLY PEAS AT MESSRS. SUTTON AND SONS.

THAT in raising new varieties of early Peas, some illustrations of which Messrs. Sutton & Sons of Reading had in pots at the last Temple Show, they have brought about a revolution in the early varieties there can be no doubt. Hitherto the type known as Ringleader, a very early selection of the Dillestone's Early Prolific type, and Suttons' Earliest Blue, both small-podded, roundseeded varieties, have represented the earliest types, with William Hurst, its variety Chelsea Gem, and American Wonder, in close company. But, thanks to this enterprising firm, we have now Early Dwarf, large and full-podded varieties of Marrowfat flavour; Peas of the quality of Telephone and Duke of Albany, and almost their size of pod, which are among the earliest, and they can scarcely fail to become valuable to the private garden and market garden. I have just seen them in their seed-farm at Reading, growing under ordinary field culture, without special treatment, beyond having the assistance of stakes, and by their side the earliest of the older types for comparison; thus affording opportunity for drawing fair and trustworthy comparisons. I am dealing only with the earliest varieties in this paper. To save repetitions of the name of the firm, it will suffice to say that the prefix Sutton comes before each varietal name of 1896. Foremost among them, and a most valuable acquisition, is the new dwarf-wrinkled Sutton's Forcing Pea, a singularly dwarf-branching form, growing to a height of 9 inches, a high-flavoured Marrowfat, producing large well-filled pods, averaging seven large Peas in a pod, the pods somewhat pointed. This is quite as early as American Wonder, but excels it in all other respects. It came from a cross made by Mr. Culverwell between American Wonder and Sutton's Royal Jubilee, and while retaining the dwarf habit of the former, there is added the longer pods of Jubilee and its fine quality. Sown out-of-doors on March 30. the crop was ready to gather on June 11. It s very prolific, and it appears to be well named-a forcing Pea. A stump podded form of t is also being tried, both have a strong constitution. Sutton's Seedling Marrowfat (1895), is from the same cross, it is a strong growing, very prolific variety, I foot in height, producing straight-pointed pods, as large as those of Telephone, and well filled; the height of the plant 1 foot. For an early crop, and for small gardens, this is a valuable variety, and especially for producing pools to exhibit the last week in June and the first in July.

Excelsior (1896) is another Early Marrowfat, a cross between Early Paragon and American Wonder, a robust grower, very prolific, producing large blunt-tipped pods, freely-branching habit, height 15 inches, pods of the character of Triumph, seven and eight large Peas in each; a very valuable variety for early exhibitions, as well as for garden purposes.

Very interesting was a group of dwarf varieties from a cross between A 1 and Chelsea Gem, all first earlies, varying in pod, some light green, some dark green, some with pointed pods, and some blunttipped. The very best plant found in each type is saved for seed, for a further proof. The practice observed by Messrs. Sutton & Sons of thoroughly fixing the character of a type before it is distributed is one to be highly commended. Seedling Peas will vary even into the third and fourth year, and sometimes for a longer period, and it is only those who have gone through the labour of selecting and fixing the character of seedling Peas who know aught of the patience and time expended on the process.

Favonrite Marrowfat (1895) is a very free-branching variety, an early second, growing to the height of 2 feet, producing large, broad, medium-pointed pods, really a wonderfully free cropper; and when it becomes more widely distributed is certain to be largely grown as a market-garden Pea for the earliest work.

Next came a very promising scedling, something in the way of English Wonder, but a great improvement in the size of pod, which is also of a deep green colour.

Early Giant, is remarkable for its long, bread, pointed, slightly-enryed pods, greatly resembling in general characteristics an early Duke of Albany, but dwarfer in growth reaching a height of 3 feet, and notwithstanding its height, it did appear as if a crop could be gathered from it as early as from any other. This may fairly be described as the largest podded early Pea.

May Queen is of the Exonian type, and about the same height. Exonian is a small-podded variety, pods freely produced and well filled; but May Queen is larger in the pod, of the same height about 2½ feet), blunt podded, and quite early. Several rows of this was very uniform in character. As showing the time occupied in fixing the character of a seedling Pea, it may be mentioned that this variety was raised in 1884 by Mr. Culverwell from a cross between American Wonder and Early Paragon, but it was not distributed until nine years after.

A I (1891), 3 to 4 feet in height, produces large, long, blunt-tipped pods, well filled, and of excellent quality; a valuable garden variety, and for early exhibitions.

Next came another promising seedling 3 feet in height, with a dark haulm, bearing long, straight-pointed pods, quite early, and looking as if it would be valuable for exhibition at the end of June. Another, equally promising, grows to a height of 34 feet, bearing very large, broad, blunt, pale pods, very handsome in appearance, it is also a great cropper, and will doubtless prove a fine garden variety. Another, of the same height, has rather smaller pods, but its productiveness is immense, and it should make a grand market variety. Another is 18 inches in height, and may be described as a dark-podded form of Favourite. It bears very handsome dark-green pods, flavour excellent, second early, robust. Another seedling, between Sutton's Early Giant and Duke of Albany, with very handsome green pods, is also highly promising. These are mentioned to show how large is the reserve of new varieties held by the firm. These will be subjected to further trial the next and following

Empress of India is a first early, though growing to a height of from 3 to 4 feet; it bears large, long, handsome light green pods, every way first-rate. This is rapidly making for itself a name as a standard variety. Bountiful came from a crop between Telephone and Early Champion, and though round-seeded, is yet of the flavour of the wrinkled types; it is as early as Early Champion, with a Telephone pod, not quite so large in size, but it is a wonderfully

free cropper, a blue round, the pods handsoms, slightly curved—an excellent market variety.

To show how closely and persistently the Peas are selected here, it may be stated that a stock of Ring-leader was among the trials, with pods twice the size of the old type. This is preferred to the old form, though a little taller in growth. The productive property is very great, and it is much approved by gardeners.

In looking over these new types of Peas, the visitor sees in all the rows a few plants specially marked, and these represent the very finest type or character of the variety. The pods of these selected plants are carefully gathered, and the seeds sowo next year for the production of seed for stock. It is in this way that the firm are enabled to keep their varieties so uniformly true. It means expense, and a great amount of labour, but it is a real investment, for the uniform character of the rows of a certain variety, sometimes from eight to twelve in number, are singularly manifest. The value of a rigid selection in maintaining the purity of stocks is beyond calculation. R. D.

DOUBLE BEGONIAS AT READING.

These plants are now in the finest form at the London Road Trial-ground of Messrs, Sutton & Sons, Reading. Two points have been kept steadily in view in improving the strain: one is, that the blossoms while being fully double, shall also be medium-sized, and finely symmetrical, in opposition to the larger, loose, "pocketty" blooms to use a term employed by the old school of Hellyhock raisers), which appear to find favour with some growers-a large, loose bloom of a Double Begonia is a floricultural eyesore. Another quality possessed by the Double Begonias of Messrs. Sutton & Sons is, that they are erectflowered, a quality gained after the exercise of the most rigid selection. A Double Begonia becomes a decorative agent of enhanced value when it displays its blooms in a horizontal instead of a pendent position, as many of the large-flowered varieties do. It is irksome to have to stoop to examine the surface of one of these flowers; to hold it up by the hand, however carefully, is to risk the danger of snapping off its somewhat brittle flower-stem. Pouble Begonias are exhibited in finely-developed character at some of the West of England flower-shows, at Trowbridge and Taunton in particular; but the plants, though large and generally profusely bloomed, lose half their effectiveness by the blossoms being so pendent, that when they are staged upon a table, it is only the backs of the flowers which are seen, remedy this defect as far as possible is the obvious duty of raisers. K. U.

MESSRS, J. VEITCH & SONS.

Admirers of the Carnation and Picotee coming to London would miss a treat if they failed to inspect the fine collection of new and old varieties now in full flower at this nursery. A good many of the varieties are grown in pots under glass, as well as in beds in the open air, so that the visitor has an oppor, tunity seldom afforded in a trade establishment of observing their behaviour under two distinct methods of cultivation. It may here be said that any good Carnation will grow as well under glass as in the open air provided it is afforded ample ventilation and is kept free from aphis, and its wants in regard to water are properly met. A good many of the novelties are kept in pots and cultivated in this manner, and amongst these we noted the following Picotees:--Brunette, a flower of neat form, with a crimson edge; Thos. Williams, with wire edge of similar colour; Amy Robsart, a purple-edged flower; Norman Carr, a nice large flower, with an edge of scarlet-tho variety not quite new; Edith D'Ombrain, with. a pink edge running deeply into the petals: Amalia, with a wire edge of purple colour; J. B. Bryant, a deep, full flower with a purple edge; and Dr. Epps, a crimson edge of great width, petals of much substance, and flower full, and very double.

The finest novelties in Carnations observed were Mephisto, a deep crimson-coloured, full flower; King

^{*} A. feroz, K. Koch.—Acaulescent Leaves forty to fifty in a rosette, oblong-spatulate, 3½ to 4 feet long, 14 inches broad in the middle, narrowed to 10 inches above the dilated convex base; middle flat, top concave, dull green, the very strong pungent point 2 inches long, edge bor-lered with recurved horny grey teeth, ¾ inch long at the base, I inch broad, leaf edge deeply sinuate between them. Peduncle, including the 10-feet long thyrsoid paniele, 25 feet long. Bracts triangular, 1 foot long, the peduncle half-surrounding, finely toothed on the top. Branches twenty-four, very stout, horizontal, the longest of them 2 feet long. Flowers greenish-yellow, 4 inches long; tube short, funnel-shaped; filaments 3½ inches long (2½ the length of the outside slightly orange-coloured segments); anthers 10 lines long pistal equal the segments.

Arthur, of deep scarlet colour, very showy when well cultivated, doing well in pots: Sir Audrey Campbell, of canary-yellow, good of its colour, but, like all the yellows, lacking in fragrance; Corunna is of sulphur-yellow, and Duke of Orleans buff-yellow. All of the above were raised by Martin Smith, Esq., Hayes, Kent.

Queen Anne (Gibbon's) is a fine flower, of a variety that is not new. It is a full flower, of deep pink colour, with petals somewhat curled. Miss Eric Hambro (Martin Smith) is white, and the perfection of form, the petals being nearly flat, and their edges quite smooth; Waterwitch, a flower of pale flesh, very double and full; W. A. Thompson, a flower having a centre of rosy buff colour and edge of crimson; Cardinal Wolsey is of the same shade of colour, but it grows more strongly, and the bloom is of greater size. Miss Helen Terry is a fine white bloom, very well filled in the centre-a fine thing; Snowdon, still considered a good white variety, the edge of the petals smooth and regular; Bendigo, well-known to Carnation growers as a fine variety, with a rich, purple-coloured bloom; Eudoxia, a flower that might not please many a good, full 'pink-coloured variety; Hayes Scarlet M. Smith), with a pretty filbert-like bud, warranted not to burst the segments, colour bright, form perfection; Uncle Tom resembles Mephisto, but it is darker in colour; Sweetheart, a showy fancy buff with a cerise flaking; Canary Bird, of a singular colour, with an edging of crimson; James Douglas, a flower of light-purple colour, a fine variety; and lastly, Mrs. Haves Fisher, in which there is an excellent white border Carnation.

We observed besides the above, Lady Ridley, white, a good grower; G. Cruikshank, similar to Cardinal Wolsey; The Dey, a rosy buff-coloured fancy, furnished with crimson and white stripes; Horace Trelawney, a flower of a deep shade of rosepink, full, and regular-formed; The Pacha, like to, but better than Mrs. Reynolds Hole; Magpie, crimson; the unsurpassed Joe Willett, Mrs. Frank Watts, and Magnum Bonum; Primrose Day has bright yellow flowers, a neat habit of growth; it is new. St. Gatien is a most desirable blush-coloured flower, with a pink stripe. There is a nice collection of fancy Carnations under name.

In the Caladium-pit there is a feast of remarkable beauty in foliage, the plants naturally dwarf, and kept so by having them inured to full sunshine, and keeping close to the glass. The collection consists almost wholly of the late Mr. Bause's seedlings. A choice gem is Lady Mosley, which has a leaf of rosy-crimson, and veins of a deeper hue, with a "wire" edge of dark-green, and removed from this about inch. a thin line of the same colour encircling the leaf. Cannas find a place at this nursery, and the collection at the present time brought together consists of the pick of continental varieties. C. Austria is the most recent introduction, and nothing finer in golden yellow Cannas has been produced, the flower being very large and the tint soft, clear, and bright. The splendid variety, C. Italia, was likewise observed in flower.

The ever-blooming Streptocarpus have received an additional new strain, with larger flowers, of deeper blue, violet, &c., and stouter footstalks. There are great hopes entertained of these new efforts of Mr. Heales' hybridistic skill, and it is certain that they will become favourites.

In the Cattleya-house the display made of C. Mendeli, C. gigas, and C. Mossiæ was very fine. Whole groups and lines of these plants being in capital blooms, especially the line of plants of C. gigas of recent importation.

The plants in the Nepenthes-house give excellent promise of pitchers later on. We were shown a cross between N. Veitchi and N. Curtisi superba whose operculum is larger than those of N. Veitchi or Curtisi superba, with short petioles, and pitchers dark brown and green in colour. The short petiole of the pitcher admits of the plants being used in table decorations, &c., where a long one would be inadmissable.

The rockery-house is looking at its best, the mosses

and Ferns being perfect as a setting for the few flowering plants disposed amongst them. Among the latter we noticed Hymenocallis microstephana, Streptocarpus, Clerodendron fallax, Allumandas, Crimums, Bilbergias, &c.

SOCIETIES.

ROMFORD AND ESSEX HORTICUL-TURAL.

JULY 2.—The annual summer show of the Romford and Essex Horticultural Society was held in the beautiful park attached to Gidea Hall on Thursday. Though not nearly so large or important as some of the East Anglian exhibitions, the commuttee may be congratulated on the success of their efforts.

Noted Mid and South Essex winners were well represented, Mrs. Willmott, of Warley Place, Mr. Georgi Alfnander, Warley Lodge, Mr. Takker, Middleton Hall, and Alderman W. W. Dufffeld, of Chelmsford, earrying off a number of the highest awards. No fewer than seven firsts went to the former for flowers—foliage plants, collection of plants, Begonias in pots, zonal Pelargoniums, Ivy-leaved Pelargoniums, plants for table decoration, and the best decorated fireplace Alderman Duffeld was 1st for stove and greenhouse plants and Colous, 2nd for specimen foliage plants and Culadiums, and 3rd for plants for table decoration.

diams, and 3rd for plants for table decoration.

Mr. Alexander was 1st for the most tastefully-arranged basket of pot plants, and best small collection of plants, Achimenes, Gloxinias, Begonias (divided with Mrs. Willimorr), and Caladiums. Mr. Tasker secured two 2nds -one for Gloxinias, and another for plants for table decoration, Mr. W. Bose, of "Bilgores," also got 1sts for stove and greenhouse plants in flower, and Ferns; and 2nd for decorated fire-place and foliage plants.

nre-piace and romage plants.

Roses and cut flowers were not a hig show, the principal winners being Messys, Prior & Son, of Colchester; the Roy.

J. Pembertor, Havering; Mr. Alexander, Mr. Tasker, Mrs.

Green, Harolt Wood; Mrs. J. W. Smith, Romford; Mr.

H. B. Michell, Elistbury, Romford; and Mrs. Williamott.

H. B. MICHELL, Eastbury, Romford; and Mys. WILLMOTT.
The best Fruit Prices went to Mys. WILLMOTT, My. Green
(four 1sts), My. Fairlynce, Chadwell Heath (three 1sts); the
Rey. F. Allen, and Lady Neave. My. Green's Strawberries
were grand specimens of the Gunton Park and Dy. Hogg
varieties. My. F. Charman, of Colchester, was placed 2nd
and 3rd for Strawberries, and 3rd for Black Cherries, Gooseberries, and White and Black Currants; and Alderman
Duffield 2nd for Gooseberries. East Anglian Durly Times.

WOLVERHAMPTON FLORAL FETE.

JULY 7, 8, 9. This Exhibition was opened on Tuesday last in the Public Park. It is several years since the town originated an annual fixture on the lines of those at Shrewsbury and York, and since then, the extent and importance of the display have materially and satisfactorily increased. In many particulars the schedule has close relations to the one issued from Shrewsbury, notably in the liberal prizes offered for specimen plants and for groups. In the Rose classes, however, there is a feature that, in the case of exhibitions held in August, is impossible of attainment. The park is a very pretty rendezvous of about fifty acres, but most of it is maintained as a pleasure ground, and on the recreation site alone there is not room (shall we say fortunately?) for the amount of variety entertainments there are at some of these fites. There is sufficient space though for a much larger horticultural show than has yet taken place. There were tive tents of good size set up on this occasion, and most of the space was well filled, if we except that in which the amateurs' exhibits were placed, and that also where the cottagers' produce was displayed The last-named class did not exhibit so generally as could have been wished Specimen plants and groups in the open classes were good, and, together with the Roses, were the principal features of the show. The exhibition of Pinks usually held in conjunction with this fixture was abandoned this year owing to the early character of the scason.

In the afternoon, after the luncheon, at which the Mayor presided, was over, a new conservatory that has been recently built at a cost of about £1.500, provided by the Floral Fétes Committee, was formally opened. This forms an important addition to the Park, and it is satisfactory that the profits which have arisen from the Petes should be devoted to the embellishment of the open spaces in the town, and to the provision of others.

PLANTS.

The largest class in this section was one for sixteen stove and greenhouse plants, and the 1st prize was won by Mr. J. Cypher, nur-crypton, Cheltenham. He had excellent specimens in bloom of Allananda nobilis, Rougainvillea Sanderima, E. glabra, Statice profusa, Phoene one predifera Barnesii, Allananda granditlora, Ixota Williamsii, and rather loss good specimens of Erica Kingsteniensis, E.

Parmentieriana, and E. tricolor Holfordii. His foliage plants included Thrinax elegans. Cycas circinalis, Kentia Fosteriana, Livistona chinensis, Croton Sunset, and C. Williamsii; Mr. Win. Finch. Coventry, who was 2nd, also showed well. He had magnificent specimens of Livistona chinensis, and Crotons Queeo Victoria and angustifolius. 3rd, Mr. Lewis Fewkes, gr. to Thos. CLAYTON, Esq., Castlebromwich.

Of six exotic Ferns there was only one exhibit, viz., that from Mr. J. V Maedonald, gr. to G. II. Kenrick, Esq., Edgbaston.

Six plants in flower were best from Mr. J. Cypher. He had fine specimens of varieties similar to some in the larger class noticed. Mr. W. Finer was 2nd. Mr. Cypher won also for six fine foliage plants, bis Croton Chelsoni in this class being very good. 2nd Mr. W. Finer. A class for five exotic Orchids was also won by Mr. Cypher, and he was 1st, too, for six specimen Palms; Mr. W. Finch being 2nd.

Mr. Lewis Fewkes, gr. to Thos. Clayton, Esq., was 2nd for six stove and greenhouse plants, his best plants being Croton Majestic, and Ixora Pilgrimi; and Mr. S. Postings, gr. to Mrs. Wight Boycott, Radge Hall, was 3nl.

In the gentleman's gardeners' or amateurs' classes, the best six Caladiums were shown by Mr. R. Sharpe, gr. to H LOVATT, Esq., Dushbury; and the best collection of Begonias by J. W. KENRICK, Esq. (gr., Mr. A. Ovyer).

Thos. CLAYTON, Esq., had the best group of six exotic Ferns.

Groups of Plants (open).—One of the tents was exclusively occupied by the groups of miscellaneous plants arranged for effect on a space not execeding 450 square feet. Seven exhibits were arranged on the grass in the centre, the promenades being on either side and at the ends. Though all the collections were of good appearance, the 1st prize was awarded undoubtedly rightly to Mr. J. Cypher, Cheltenham. In the centre of this group a graceful Palm resting on a rostic stand several feet high, supported by four pillars at the corners covered with cork-bark, and centaining numerous pockets in which were Ferns, Fuchsias, Caladiums, Odontoglossums, &c. Nomerous specimens of Cattleya citrina on rafts also were suspended, and were very effective. At the hase was a series of smaller groups, and at each corner of the exhibit a larger cone-shaped group of plants. The plants used were choice and good, Crotons being especially well coloured. The only possible objection there can be to this form of grouping, would be that the rustic arrangements, and the system of making most of the plants appear to be growing from rockwork, necessitate the exclusion of almost all plants of specimen size one might expect to find in such a group. The 2nd prize was won by Mr. W. Fincu, musseryman, Coventry, Messrs, Tom B. Doms & Co., 32, Queen Square, Wolverhampton, were good as 3rd; and Mr. J. V. Macdenshid, gr. to G. H. Kerrick, Esq., was 4th.

The best group of plants (Amateurs) arranged for effect on a space of 400 square feet was from H. Lovatt, Esq., a very satisfactory arrangement.

ROSES

The principal class for Roses was of the same extent as the largest at the Crystal Palace Show, and seventy-two distinct single trusses were required. There were only three competitors, and prizes therefore fell to each of them. It was not surprising that Messrs, Harkness & Sons, Bedale and Hitchin, after winning the similar class in the Metropolis, should be the best exhibitors so much nearer their northern establishment. Indeed, they staged a fairly good collection, in which the following varieties were of excellent quality. Of those in the back row, Marie Baumann, Dr. Sewell, Beauty of Waltham, Star of Waltham, and Comtee de Raimbaud. Centre row: A. K. Williams, Comtesse de Ludre, Lady Shethield, Chas, Lefebyre, Senateur Vaisse, Horace Vernet, Edouard André and Mrs. Jno. Laing. Front row: Due de Roban, Some of the blooms, as for instance, Heinrich Schultheiss and Captain Hayward, were of a nature that illustrated the difficulty there had been to show so extensive a collection upon this date in the present season. Messrs, Mack & Sons, York, were 2nd, and Messrs. Perkins & Sons, Coventry, 3rd.

In the class for forty-eight single blooms distinct, the premier prize was taken by Messis. A. Dickson & Sons, Newtownards, Ireland. The best blooms in this exhibit were Mrs. John Laing, Marie Rady, Duke of Albany, Ferdinand de Lesseps, Marie Baumann, Earl of Dufferin, Camille Bernardin, Madame Percire, and Bessic Brown. Messis. Harkness & Sons were 2nd, and H. Meeryweather, Esq., Southwell, and There were three other exhibitors in this class, of whom Messis. Perkins were awarded 4th prize.

Messrs Hardness & Sons were first also in the class for thirty-six single blooms distinct, and in this class the quality of the blooms was better. Alfred Colomb, Fisher Holmes, Comte et Raimband, Morie Baumann, Contesse de Eudre, Chas. Darwin, Dr. Andry, May Quenell, and E. Y. Teis were good. H. Merryweather, Esp., Southwell, was a fairly good 2nd; and Messrs, Droksons 3nd. There were three or four other exhibitors in this class.

The class for twenty-four distinct blooms was won by

The class for twenty-four distinct blooms was won by Messrs, Drewsons, and in this competition the firm exhibited a stand of fresh good quality flowers. The best were Captain Hayward, Marchioness of Dufferin, Alfred Colomb, Oliver Delhonme, and a pretty cream-coloured seedling. Messrs, Townsinh & Soris, Worcester, were find, and Messrs, Harkness & Sons 3rd. There were four other collections.

The class for twelve new Roses had but one exhibitor, viz., Messrs, Dick-ons, and they showed varieties similar to those noticed at the Crystal Palace in the same class.

The best dozen of any dark coloured Rose was one of Captain Hayward, from Messrs. Dicksons; Messrs. D. & W. Croll being 2nd with M. E. Y. Teas; and D. Prior & Sons 3rd, with Horace Vernet.

Messrs. Dicksons had also the best dozen of any light Rose in Marchioness of Londonderry; H. V. Macins, Esq., Worksop, coming next with Her Majesty; and Messrs. Mack & Son, Yorke, 3rd, with Caroline Testont.

Twelve blooms of Tea Roses distinct, were only exhibited by three competitors, of whom Mr. JNO. MATTOCK, Oxford, was 1st with small pretty blooms, especially the specimens of Comtesse de Nadaillae, Ernest Metz, and Madame de Watteville. Mes-rs. D. PRIOR & Sons, Colehester, were 2nd ; and Messrs. Jas. Townsend & Sons, 3rd.

Mr. JNO. MATTOCK was also lst for the most decorative arrangement of Roses, exhibited in the same method as at he Palace Messrs, Townsend & Sons were 2nd.

AMATEUR CLASSES.-The best collections of thirty-six Reses and twenty-four Roses were from the Rsv. J. H.

PEMBERTON, Havering-atte-Bower, Essex, who was 1st, and in beth classos H. V. Machin, was 2nd.

H. V. Machin, Esq., was the only exhibitor of twelve blooms of Tea Roses. There were other classes of minor

CUT-FLOWERS AND BOUQUETS.

This section included the usual classes for stove and greenbouse flowers, bouquets, and arrangements of certain cut-flowers. The hest twelve bunches of stove and greenhouse plants were from Mr. CYPHER, Cheltenham. All of the varieties were choice, but the flowers were not so fresh-looking as they might have been, though the Cattleyas and Dipladeniss were very good.

The best hand-bouquet was from Messrs. M. Jenkins & Sor, Newcastle-under-Lyme, beating the celebrated Coventry firm of Perkins, who, however, excelled Messrs Jenkins for a bridal bouquet and for a bridesmaid's bouquet, the latter being very pretty.

The most tasteful arrangement of cut Pansies and Violas was made by Mr. Jso. Smellie, Bushley, near Glasgow, who was awarded a Silver Cup or £5 in money; M. CAMPBELL, Esq , Blantyre, was 2nd.

Twenty-four Fancy Pansies (amoteurs) were best from Mrs. H. LOVATT, Newport, Salop, and the best twelve blooms also.

 M_{\star} Campbell, Esq., Blantyre, was first for twenty four Pansies in the open classes, and Mr. Jao. Smittle, 2nd, though we think the positions should have been reversed. M. CAMPBELL, Esq., was, however, rightly 1st for eighteen blooms.

The best collection of twelve bunches of Sweet Peas was shown by U. B. Johnston, Esq., Tettenhall, and there were several pretty collections.

FRUITS AND VEGETABLES.

The class for four bunches of Grapes distinct was won by Mr. J. Read, gr. to the Earl of Carnaryon, Bretly Hall, Burton-on-Trent. He showed Madresfield Court, Museat of Alexandria, Black Hamburgh and Buckland Sweetwater. The black grapes were very good Mr. J. H. Goodacre, gr. to the East of Harrington, Elvaston Castle, Derby, was 2nd He had fine black Hamburgh and Muscat Hamburgh, but bis Muscats were poor. Mr. Bannerman, gr. to LORD BAGOT, Blithfield, Rugeley, was 3rd.

The best two banches of white Grapes were of Foster's seedling, shown by Mr. Sidney Bremmell, gr. to H. H. France Haynerst, Esq., Shropshire. Mr. Bannerman was 2nd with Buckland Sweetwater, and Mr. R. Read 3rd with Foster's Seedling.

Black grapes were shown best by Mr. J. Gray, gr. to S'r Geo. E. MEYRICK, Bt., Bodorgan, Anglesey, who had two extra good bunches of Black Hauburgh, berries especially fine, Mr. Banneaman showing Black Hamburgh was 2nd,

and Mr. J. Read 3rd with the same variety.

The best green-fleshed Melon was one from Mr. Thomas Wilkins, gr. to Lady Theodore Guest, Henstridge, and Mr. J. Wilkes, gr. to Mrs Meakin, Cresswell Hall, Stafford, had the best searlet-fieshed Melon.

Peaches and Nectarines were good The best dish of six fruits was from Mr. Frank Harris, gr. to Lady H. Somerser. Ledbury, who showed Eastnor Bellegarde; Mr. Gray was 2nd with large Galande; and Mr. John Wallis, gr. to R. SNEYD, Esq., Keele Hall, Staffs, 3rd, with finely coloured Stirling Castle.

Mr. GOODACRE, had the best Nectarines in Lord Napier; Mr. J. Read was 2nd.

There were a few good dishes of Strawberries, and a few of

A capital collection of fruit in nine dishes was shown by Mr. F. Harris. His grapes (Foster's Seedling) were unripe, but Brown Turkey Figs, Golden Perfection Melon, Smooth Cayenne Pine, Hales Earley and Bellegarde Peaches, Pitmas-Orange Neetarine, Bigarrean Napoleon Cherries, and Black Hamburgh Grapes were capital. Mr. Geo. Reynolds, gr to the Messrs. de Rothschild, Gunnersbury Parks, Acton,

gr to the Messrs, acromscelle, Guinersonry Parks, Acton, Middlesex, was only a very few points inferior to the collection just noticed; Mr. J. H. Goodalae was 3rd.

Collections of Vegetables were not numerous, but several good ones were staged. Messrs. Sutton's prize was won by Mr. C. J. Waite, gr. to the Hon. W. P. Talbot, Surrey, Lady

THEODORE GUEST being 2nd

Mr. C. J. Waite also won the 1st prize in Messrs. Webbs
class, and in Messrs Carters class. Another prize offered by
Messrs. Dobbs (a local firm), was won by Lady Theodore

In the gentlemen's gardeners, or amateurs classes, the

best collection of fruit, of six varieties, was shown by the

EARL of CARNARYON, Brethy Hall. His Grapes, Pineapole. Figs and Peaches, were capital fruits. Load Bagot was 2nd, and had very fine grapes, the EARL of HARRINGTON being 3rd. The best collection of vegetables came also from the EARL OF CARNARYON.

MISCELLANEOUS.

Messrs. Barr & Son, King Street, Covent Garden, London, made one of their usual exhibitions of hardy flowers, her-baceous and annual. Pretty bunches of Lilium testaceum,

L. pardalinum, Michauxi, and other Lilies were noticeable.
An exhibit of Mushroom Spawn, made as attractive as its nature would allow, was made by Mr. WM. D. BASON, spawn manufacturer, Finchfield, Wolverhampton.

A large group of tuberous Begonias in double and single-flowered varieties was made by Mr. H. J. Jones, Ryccroft Nursery, Lewisham, S.E., and awarded a Gold Medal. Although the plants had been all brought from London, the group presented a capital appearance, most of the varieties being of good quality and the arrangement tasteful. An exhibit of herbaccous flowers, and annuals from Mr. J.

WHITE, 51, Broad Street, Worcester, contained some capital flowers of varieties of Gaillardias.

Messrs. Thomson, Spark Hill Nurseries, Birmingham, showed a group of flowering plants

Messrs, JARMAN & Co., Chard, Somerset, exhibited Roses and Sweet Peas.

Messrs, Hewitt & Co., Solihull, Edgbaston, Birmingham, exhibited herbaceous and hardy flowers, and some first-class blooms of tuberous-rooting Begonias

A large display of herbaceous flowers, Boses, &c., in neat bunches in earthenware bottles from Messrs Duksons, Chester, was excellent. Eschecholtzias and Gladiolus and Lilies made the collection very bright. The Hawley Challenge Cup offered for the best display of plants, floral arrangements, and fruit among honorary exhibits was awarded to this collection

Mr. II ECKFORD'S Sweet Peas were well represented, and were awarded a Gold Medal.

Messrs, E. Weber & Sons, Stourbridge, exhibited vegetable produce and flowers, and a large collection of Ferns was shown by Messrs, W. & J. Birklinherd, Sale, near Manchester, in their usual style (Gold Medd).

Messrs, Pritchard & Sons, Shrewsbury, had a fine lot of Carnations and Prootees, and Mr. Robt, Sydenham, Tenby Street, Birmingham, furnished a table with cut-flowers and

Smilax, arranged in rustic, silvered gates.

Messrs Enwards & Sox, Sherwood, Nottingham, displayed their Edwardian ware in the shape of baskets for plants and

epergnes for cut-flowers.

Miscellaneous plants were shown by Tom B. Dollas & Co., Welverhampton, Mr. S. HARBER, Tettenhall, Mr. R. Lowe, Welverhampton, and Gloxinias by Mr. F. A. Godfalv, Stour-

bridge
Mr. M. Campiona, High Blantyre, had cut-flowers of Carnations, Pansies, &c., and Mr. H. Brownstein, Sole, a fine lot of summer-flowering Chrysanthennums (Gold Medal). Roses were shown by the English Fruit & Rose Co.,

Hereford.

WIMBLEDON AND DISTRICT HORTI-CULTURAL.

JULY 8 .- This, the twenty fourth annual exhibition, was held in the grounds of Ricards' Lodge, Wimbleden Park, the residence of Percy Mortimer, Esq., President of the Society. Three tents were placed on the slope, which falls away to a pleasant valley. The tents were well filled, and an attractive exhibition was provided, which reflected much credit on Mr. W S Thomson, the Hon. Secretary of the Society and the stowards

Groups made a good feature, the 1st prize being awarded to Mr. J. Law, gr. to R S DEAN, Esq., the Priory, Wimbledon, Palms, Crotons, and various foliaged and flowering plants being surrounded by the long spikes of plants of Francoa ramosa. Mr. Thornton, gr. to E. CROCKER, Esq., Wimbledon Hill, was 2nd, his being a rich group, gay with tuberous Begonias and variegated-leaved plants, but rather

heavy in the matter of arrangement.

The best four stove and greenhouse plants came from Mr. Hutton gr to G. E. Frere, Esq., Wimbledon Furk, and included a good hush of Clerodendron Thompsoniana, var. Balfonri.

Mr. H. Alderman, gr. to G. HATFIELD, Esq., Wimbledon, had the best six foliaged plants, staging good specimens of Phoenix reclinata, Alocasia metallica, A macrorhiza varie-

gata, Kentia Fosteriana, Dracena Youngii, and one other Mr. T. Methven, gr. to W. Keiller, Esq., Fernwood, Wimbledon Park, had the best six stove and greenhouse plants in flower, in 9-inch pots, having among them two mee

places of Cattleya.

Some very good Fuchsias were shown, the collection of four which won the lst prize for Mr. W. Thorstox were indeed. highly creditable : Mr. H. Wells, gr. to G. D. CARVER, Esq. Ingresby, Wimbledon, was a good 2nd. Mr. Thornton had the best six Coleus.

Zonal Pelargoniums were well grown and flowered; the 1st and 2nd prizes for six plants were taken by Messrs. Jones and Chandler, the latter gr. to the Rev. Canon HAYGARIH, Tho Vicarage, Wimbledon Mr. J. French, gr. to Mrs. BARGLAY, Wimbledon Park, had the best twelve zonal Pelargoniums, restricted to a certain size of pot, small, but admirably-grown and flowered specimens; Mr. Law was 2nd. These were the leading plant classes, though plants were shown in various classes by amateurs and others

CUT FLOWERS.

The leading class for these was that for which Mrs. Percy MORTIMER offered a special 1st prize for twenty-four cut Roses, this was won by Mr. Will Taylor, Hampton Hill, who had this was won by Mr. WILL TAYLOS, HAMPION HIII, who had bright, clean blooms, the best being, Victor Hugo, Suzanne M. Rodocanachi, Prince Arthur, Harrison Weir, A. K. Williams, The Bride, and Madame Hoste. Roses were also shown in other classes, but they were much past their Special prizes were also offered for eighteen distinct bunch s of hardy plants, the best coming from Mr. A. Newell, gr. to Sir E Saunders, Fairlawn, Wimbledon Newell, gr. to Sir E SAUNDERS, Fairlawn, Wimbieson Common. Delphiniums, Lilles, and such like were in good character. Special prizes were also offered for table plant; and these were admirably shown, small, compact, well-grown examples being the rule. Lady Saundeas offered prizes for ladies' sprays and buttonholes, Mr. Newall being the most successful exhibitor. FRUIT ETC.

The best four dishes of fruit came from Mr. C. Bentley, gr. to Captain Bosworff, Cedar Court, Rochampton, who had Black Hamburgh Grapes, Stirling Castle Peaches, Pineapple Necturine, and a Melon; Mr. H. Alberman was 2nd, gaining a point in Grapes, but losing on other subjects.

Melons were also shown, Countess being the best-

Mr C Knowles, gr. to the Hon. Mrs. Egeaton, Roe hampton, had the best three bunches of black Grapes, and

also of white; the latter were Buckland Sweetwater.

Mr. A. Newfll had the best brace of Cucumbers showing Suttons' Progress in fine character.

Vegetables made a good feature, the special prizes offered by certain trade houses bringing very creditable examples. The best were shown for those offered by Messrs, D. S. Thon-SON & SON, the Nurseries, Wimbledon, Mr. FRENCH taking the 1st prize.

t prize. Mr. Thornton was 2nd. Messrs, James Cartor & Co., Holborn, were also donors of orizes. Mr. C. Bentley, gr to Captain Bosworth, Cedar Court, Rochampton, was 1st in this class; and Mr. J. Herros

The 1st prize for Messrs. Sutton & Son's collection was

won by Mr. Mills, gr. to G. D. Carver, Esq., Ingresby.

There were several classes for vegetables, but these were not of sufficient importance to call for further mention

MISCELLANEOUS.

Messes D. S. Thomson & Son contributed a very fine group of foliaged and flowering plants, and Messrs. J. Laino & Sons the same; and the former also had a large collection of hardy and other flowers.

NEWCASTLE-ON-TYNE HORTICUL-TURAL

July 8 9 10 -This annual exhibition was this year held about fourteen days earlier than usual, an alteration which has certainly not been any disadvantage, seeing that the high-class character of the show was fully maintained when the exhibits were taken as a whole.

Roses, amongst cut flowers, were wonderfully fine and northernmost growers having certainly the advantage, notally, Messrs. Crot. & Soss of Dundee.

Hardy herbaceous cut flowers, too, were surprisingly good, these alone making a fine display. Violas and Pansies were, as usual, of first class quality. Specimen-plants certainly showed a falling off, but groups and smaller plants are

Fruit was also good, if not quite so plentiful as on former

Miscellineous tride and o her exhibits were present in large numbers, adding much to the general effect

Table decorations and other floral arrangements were again well to the front; these have been well shown at

Newcastle for many years past.

For the past few seasons this Society has been unfortunate in selecting days which have proved unproportious as regards weather. It is to be hoped on this occasion it will be more fortunate, and thus recoup its previous losses.

PLANTS.

For a group of plants arranged for effect, Mr. McIntyre, gr to Mrs. Pease, Darlington, was an easy winner his group being put up with great taste, and not in any way crowded or too showy. Bamboos and light Palms (chiefly Cocos plumosus), with well-coloured Crotons, were the chief foliage plants, whilst Anthorium Andreanum, Amaryllis aulies, and a few treshids were the best-flowering examples. Mr F Edmonison, florist, Newcastle-on-Tyne, was placed 2nd, but the fault of covering rather too much ground with the material used was noticeable; usually it is the opposite to this

For six specimen plants, Mr. Nicholas, gr. to the Marquis of Zetlant, was the winner in a very easy fashion, his best examples being Erica depressa multiflora and Dipladenia amabilis, both extremely well-flowered Mr Nicholas was also 1st with four plants, which were

all good, owing to the next competing collection being very close. Mr. Nicholas showed a finely flowered Ixora and a splendid example of Anthurum Scherzerianum, here. Mr. WYLAM, Shrukhouse, Frantington, who came a near 2nd, had Stephanotis floribunda, covered with flowers, and a good

plant of Phomocoma prolifera, in fresh condition.

The best six foliage plants were staged by Mr. Nicholar, who had a grand plant of Kentia australis, and a finely-coloured Croton Queen Victoria; Mr. McIntyre, who followed closely, had Crotons and Cycads as his leading plants.

Mr. M'INTYRE was 1st however, with six Exotic Ferns, staging immense plants of Davallia Mooreana and D. fijiensis plumosa. The same exhibitor was also 1st for four Crotons, good plants of medium size, and well coloured.

The best specimen Palm was a fine example of Kentia Fosteriana, from Mr. F. J. JENNINGS, florist, Newcastle-on-Tyne.

The best singleflowered tuberous Begonias were those from Mr. Pitt, gr. to C. S. Bell, Esq., Wolsington, and the best double from Mr. Wm. Laws, Pouteland, each exhibit consist-ing of a dozen freely flowering plants.

The best arrangement of plants for fireplace decoration was by Mr. McIntyre, but it lacked decided features.

CUT FLOWERS, ROSES, ETC.

For seventy-two blooms in thirty-six varieties, Messrs. D. For seventy-two blooms in thirty-six varieties, Messrs, D. & W. Choll, bundee, was an advanced 1st, the flowers being remarkable abke for size and colour, light kinds predominated amongst the finest examples; the best throughout being Mrs. John Laing, Spenser, Mrs. R. G. Sharman Crawford, White Lady, General Jacqueminot, Prince Arthur, and Delta of Heliaband. This archibit as wind the Same nord, white Lady, General Jacqueminot, Prince Affair, and Duke of Edinburgh. This exhibit also gained the Silver Medal of the Royal Horticultural Society. Messrs. R. Mork & Sons, Catteriek, were 2nd, having G. Piganeau, A. K. Williams, and Caroline Testout as their best blooms. Messrs. HARKNESS & SON were 3rd.

Messrs, Croll & Son repeated their success in the next class, for forty-eight varieties, most decisively; here were to be noted Gustave Piganeau, Captain Hayward, Prince C. de Rohan, and other kinds as in the previous class. Messrs. HARKNESS & Son in this instance were 2nd, showing very bright flowers of medium size.

For thirty-six varieties Messrs. J. & A. May, Bedale, were 1st, dark varieties predominating; Prince Arthur, Harrison Weir, Horace Vernet, and General Jacqueminot being firstclass examples. In this class Messrs, Croul were 2nd with light kinds as in contrast to the preceding, two of the best

being Marquis of Downshire, and Merveille de Lyon.
With twenty-four trebles Messrs, Choll were again 1st with a very bright exhibit of splendid flowers; some of the best of these were Madame Hoste, Luciole, Viscountess Folkestone, Souvenir d'un Ami, Marie Van Houtte, and Innecente Pirola, the Teas being a striking feature here. The premier award went to the same exhibitors for twelve flowers of any one variety, Mrs. John Laing being thus henoured; the blooms were extra fine, and of deep colour. They were also 1st for twelve Teas. Here the best were They were also let for twelve Teas. Here the best were Madame Lambard, Jean Ducher, and Marie Van Houtte, good colour again being a leading feature. Messrs. MACK & SON

were 2nd in this latter class.

In the amateur classes, the competition was likewise good. The most successful being Mr. Finlay, gr. to Mrs. MAYNARD, Proud, Darlington, who was 1st for twelve trebles, staging a very even set of flowers, also bright and fresh. The best were Barniecide, A. Rothschild, and Etienne Levet. To this

were Barnecole, A. Rothschild, and Edenne Levet. To this exhibit was awarded a Silver Cup, offered by the Turner Memorial Trustees, and of the value of £5.

Mr. W. Huttchitson, Kirby Moorside, was 1st for twelve Teas, Ethel Brownlow and Madame Hoste being two of the best. For twelve in variety the same exhibitor was also 1st,

Dr. Hogg and Victor Hugo being the best blooms.

Hardy Herbacous Cut Florers—In this section there was an extensive display in the two classes, the best kinds now in season being shown. Unfortunately, through not complying with the terms of the schedule, several exhibits were dispullified. At the head of the cut flower section are the following words—"Set up in water and named, adherouse dispathjied." These plan instructions were intringed in several cases, some not having any names whatever, and others not completely named. This was most unfortunate, but the exhibitors who did comply should certain the completely named. composition on the exploitors who did compay should extend the horizontal that the class for eighteen varieties, no prize was consequently awarded; but special note should, however, be made of at least two fine exhibits, viz., those of Mr. F. Edmontson, florist, Newcastleon-Tyne, and Messrs. HARKNESS & Sons; these were both first-class displays.

The same failing occurred in the class for twelve varieties, but not to the same degree, there being sufficient number of persons showing in compliance with the schedule to take the prizes. In this class, Mr. W. HUTCHINSON was let with a very fresh and bright display, some of the best bunches being those of Corcopsis grandiflora, Gaillardia grandiflora, and a fine banch of Alstremeria chileusis; Mr. J. G. McKenzie, gr. to Rev. R. Burdon, Wylam-on-Tyne, was a near 2nd; and Mr. McIndoc 2rd, in whose exhibit were Troppedium speciesumand Sparaxis pulcherrima.

PANSIES AND VIOLAS, ETC.

For forty-eight Fancy Pausies, Mr. M. Caurelli, High Blantyre, N.B., was 1st, with blooms fine in colour and quite fresh. Mr. J. Smellie, Busby, near Glasgow, being a close 2nd

With twenty-four Fancy Pansies Mr. Campbell wis also lst, being in this instance followed by Mr. Davison, Outon,

For twenty-four sprays of Violas, six blooms in each spray, Mr. Camphell, was once more 1st, and that in keen competition, a few of his best being Charm, Magic, Lemon Queen, and Countess of Kintore; Messrs. W. Patt & Co., Bridge of Weir, Glasgow, was 2nd in this class, two of his being A. J. Rowberry, a deep yellow, and Archic Grant, a rich rurole

Carnations are always shown well at Newcastle, this occasion being no exception to the rule. Mr. J. Cavin., 1918-1811 Road, funderland, was 1st for twelve varieties with clear, fresh blooms.

Mr. Campbell was 1st for twelve varieties in bunches of not more than six blooms each; and the hest forms of the Malmaison here told beavily. Mr. CAVINS came 2nd with the tree and ordinary forms, the whole being a very fresh, clean exhibit.

Mr. Nicholas was a good 1st for twelve varieties of stove and greenhouse cut flowers, showing amongst other good things, Ixora Duffi and Dracophyllum gracile. Mr. McIndoe, gr. to Sir Joseph Pease, Hutton Hall, Guisborough, was a good 2nd.

TABLE DECORATIONS, ETC.

For a single stand for the drawing-room, Mr. F. Edmond-For a single stand for the drawing-room, Mr. F. EDMOSP-son was 1st with a light, tasteful arrangement, the only ex-ception being that the base was rather too massive. Miss EDUOXDSON followed in this class closely. Messrs. Perkins & Son, Leamington, were very successful in this section, showing in their usual artistic style, and taking 1st for handbouquets (which also gained the Silver Banksian Medal as the best exhibit in this section for bridal bouquets, for a basket of Roses—a most pleasing and effective arrangement, for a way the best in its class,

Miss Edmondson was 2nd for a basket of Roses; Mr. Jennings occupying the same position for a bridal bouquet, and Mr. F. Edmondson for a hand-bouquet, the latter a very free and and informal arrangement.

FRUIT.

For a collection of eight dishes, Mr. Kirk, gr. to J. Thompson Paron, Esq., Norwood, Alloa, was worthily to the fore with a fine exhibit, consisting of some fice Black, and Golden Hamburgh Grapes, a good Queen Pine, Royal George Peaches, Lord Kapier Nectarines, Brown Turkey Figs, and Windsor Castle Melon; Mr. McIndon who was 2nd, lad strong points in his Muscat Grapes, Early Transparent Gage Plums, and Pine-apple Nectarines.

Mr. McInnoe furned the tables on his opponent in the class for four varieties, having as his best Stanwick Elruge Nectarines and Muscat Grapes; Mr. KIRK following with good Granes and Peaches.

For four bunches of Grapes, not less than two varieties, Mr. McIndoe was again 1st, Muscats and Black Alicantes being his choice.

In the class for Muscats only, Mr. McIndoe was again 1st, his exhibit being first-class, colour and maturity, being conspicuous points

The best Black Hamhurgh came from Mr. Tullett, gr. to The best Black Hamhurgh came from Mr. tullett, gr. to Lord Barnard, Raby Castle, Darlington. The best Peaches were a fine dish of Royal George from Mr. Luke Thompson, gr. to A. GUTHRIE, Esq., and the next best, one of Beilegarde, from Mr. McIndoe, who was, however, 1st with a dish of Nectarines or Pine-apple; the 2nd going to Mr. McKenzin with Lord Napier.

A fine dish of black Tartari in Cherries gained for Mr. McIndoc the 1st prize, as did, in its class, another excellent exhibit of Tomato Invincible.

MISCELLANEOUS

The Silver Medal of the Society was offered for the most meritorious exhibit by florists and nurserymen not in th comp titive classes. This was awarded to Messes, W. Flatt & competitive classes. This was awarded to desses, w. Fill a Co. [Rexham, the chief features in which were the finely grown Coniters, and the hardy flowers. Mr. Jas Douglas steged several choice and new kinds of Curnations and Picotces, the best of which were Mrs Donglas, rosys-almon and of fine form; Pandelli Ralli, clear yellow; Wmifrel, deep terracotta (better than Reynolds Hole; Mr. Eric Humbro, the best white; Waterwitch and Miss Andrry Campbell, as well as Voltaire, a yellow-ground Picotee with a very bright rosy margin.

Messrs, Dobble & Co., Rothesay, showed an extensive lot of Pausies, Violas, Sweet Pers, bardy border flowers, and other specialties.

Messrs, Kent & Brydon, Darlington, showed hardy herbaccons and other flowers, including their tine ne v form of Chrys inthemum maximum. Messes, J. W. Birkenhead, Manchester, had a large display of choice small Perus. Mr Currengerson, of Rothesay, another of hardy flowers; and Messrs, Joseph Robson & Sons a large group of Conifers, &c.

Trade Notices.

THE Belgian Syndical Chamber at a recent meeting unanimously adopted the following proposition: "The trade in plants in Belgium shall, in the absence of any express stipulation to the contrary. be thus regulated -1. Plants are despatched and travel at the risk of the consignee. 2. Payment shall be made at the residence of the consignor. 3. Accounts between nurserymen living in the same horticultural centre (Antwerp, Bruges, Brussels, Ghent, Liège, are presented twice a year (in January and July). 4. Business transactions between town and town, or with foreign countries, are conducted for cush, with a discount of 2 per cent, or at the expiration of three months without discount.

THE firm of Cross & Donaldson, whose specialty is grass and Clover seeds, having been dissolved by mutual consent, the business will, we understand, be carried on as Cross & Cross, at 8, North Bank Street, Edinburgh, and in the old premises at Belfast, in which are fitted up an extensive range of cleaning machines of the most complete description.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fabr. for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

1. Scotland, E.; 2. England, N.E.; 3. England, E.; 4. Midland Counties; 5. England, including London, S. Principal Grazing, &c., Districts— 6. Scotland, W.; 7. England, N.W.; 8. England, S.W.; 9. Ireland, N.; 10. Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 4, is furnished from the Meteorological Office:-

"The weather was generally changeable, with frequent falls of rain over the western and northern parts of the kingdom, and occasionally similar conditions were experienced over the southern and eastern districts also.

"The temperature did not differ materially from the mean, The highest of the maxima were recorded either at the commencement or towards the end of the week, and ranged from 78° in 'England, S.,' and 77° in 'England, E. and S.W., to 68 in 'England, N.W.,' and to 64 in 'Scotland, N.' The lowest of the minima were registered on rather irregular dates over England and Ireland, but occurred on July 1 at most of the Scotch stations; they ranged from 41° in 'Scot-Lind, N and E ,' and in England, E.,' to 50' in 'England, N.W., and to 55 in the 'Channel Islands.'

"The rainfall was less than the mean over the greater part of the kingdom, but slightly exceeded it in 'So dland, N.' and 'Ircland, N.' and just equalled in 'Scotland, W.' and 'England, N.W.'

"The bright sunshine was somewhat deficient in most places, but slightly exceeded the normal in 'Scotland, E., England, N.E. and S.W., 'Ireland, S.,' and the 'Channel Islands.' The percentage of the possible amount of duration ranged from 51 in the 'Channel Islands,' and 45 in 'England, S.W., to 25 in 'Ireland, N., and 16 in 'Scotland, N.'

POTATOS.

Our market is now well supplied with home-grown. Prices vary between 5s, to 7s. per cwt. according to sample. At the moment demand is sluggish. J. B. Thomas,

SEEDS.

LONDON: July E. - Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E. write Merchants, of Great Maze Pond, Borough, London, S.E., write that to-day's seed market, as usual at this time of year, was as nearly stagmant as possible. Fine new home-grown Trifolium, is now obtainable at very moderate figures. French prices for this article, are several shillings per cwt. above English. Small sowing orders come to hand for Mustard and Rape seed. Canary seed, being now cheaper than ever before known, attracts some speculative attention. Hempseed keeps dull. Peas and Haricots, in the absence of any demand for same, are well held. Linseed is flat.

POTATOS.

Beneugu: July 7.-Quotations ranged from 4s. 61. to 7s. per cwt., with a quiet trade.

Spitalfields: July 7 .- Quotations: - Hebrons, 90s. to 100s.; Dunbars, 100s. to 120s.; Early Rose, 90s. to 100s.; Jersey Kidneys, 100s. to 110s.; do., Flukes, 110s. to 120s.; do., Rounds, 90s. to 100s. per ton.

STRATFORD: July 7.—Quotations:—New: English, 4s to STRATFORD: Jaty:—Quotations:—New: Enginer, 4s to 5s. 6d; Jorsey Kidneys, 4s. to 5s. 6d.; do. Flukes, 6s. to 7s.; Cherbourg, 5s. to 6s. 6d.; St. Malo Flukes, 5s. to 5s. 6d. and 7s.; Lishon, 4s. to 5s. 6d.; Canary, 4s. to 6s. per cwt. Old: light-soil, 20s. to 40s.; Magnums, 20s. to 40s. per ton.

Farrington: July 9.—Quotations:—Bedford Puritans, 5.. to 5s. 6d.; do., white Hebrons, 5s. to 6s.; do., reds, 5s. to 5s. 6d. per ewt.

LONDON MARKET AVERAGES: July 8 .--Snowdrops, 110s. 1030s; Hebrons, 100s. to 110s.; Early Regents, 100s. to 110s.; Early Roses, 100s. to 110s.

BINE OF CUCUMBER WITH FASCIATION: H. H. This appearance is usually the result of extreme vigour the plants, for which, owing to the denudation of many of the shoots when the plants are cultivated under glass, there are but few outlets left. It seldom appears after the fertile ingredients in the soil are partially exhausted. Twin fruits are due to the same cause

CHRYSANTHEMUM MANURE: Chrysaut. The formula given would be suitable for using at the rate of 2 oz. to the square yard, or, say, a teaspoonful to a 10-inch pot once a fortnight from the time the pots are filled with the roots till colour be repots are miced with the roots the colour of re-marked in the buds. Fowls'-manure should be heated by throwing it in a heap against a wall under cover, covering it up with dry earth. It will in a few months lose much of its moisture, and decay will have set in. Fresh fewl's dung is dangerous in use. When decayed it should be the same manner, or a bag may be filled with it and suspended in a cistern or water-butt, along with another filled with soot. The water when used should be of a light-brown colour, and not muddy. Your third question is answered in these replies. Get Artificial Manures, by Ville, published by Longmans & Co., London.

COMPLETE INSTRUCTION IN CULTIVATING STRAW. BERRIES, MELONS, AND CUCUMBERS, AND THE CONSTRUCTION OF GLASSHOUSES, &c.: Provide. Such a vade mecom is the new edition of the Gardeners' Assistant, shortly to be published by Messrs, Blackie & Sous, London and Glasgow. The price will probably be under the sum named in your note.

Correction.—Messrs, W. W. Johnson & Son, Limited, of Boston, the raisers of a new Pea, selected among a few others to receive an Award of Merit by the Fruit Committee of the Royal Horticultural Society which met at Chiswick on the 29th ult., inform us that their new Pea is called, and will be distributed as, "Boston Unrivalled," not as "Boston Unequalled," the name given in our note of the meeting appearing on p. 15.

ELECTRIC LIGHT, &c.: Austria. The reason why no other communications have appeared is probably because our growers do not see their way to make it pay. Something also must be attributed to our national apathy in the matter of the reception of new ideas and novel practices. Our American cousins find in some cases that it does pay for early forcing purposes. 2. The fertiliser you name seems deficient in potash, unless some is contained in the porphyry. Experience is the only test.

FOREST-GATE AND STRATFORD AMATEUR CHRYSAN-THEMUM SOCIETY: H. A. S. The schedule of your monthly meetings for the current year is a satisfactory one, and calculated to produce some very interesting and instructive exhibitions at the various meetings. We may suggest that, instead of offering money prizes at such meetings, it would be better to substitute medals or such like, that may be kept as souvenirs of the members success. Thanks for the photos. We shall most likely re-produce one or both of them for the interest of our readers.

HYBRID PERPETUAL ROSES: X. L. Such a list as you require would be readily furnished by any good Rose nurseryman. It would occupy too much of our valuable space to be given here.

Insects: J. W. T. Conistone. The large caterpillar is that of the "Puss-moth" (Cerura vinula). R. McL.

—L. B. G. The insect attacking your Dendro-biums is Xylchorus morigerus—in its perfect state a beetle. There is no better means of getting rid of it than by cutting away the parts affected and burning them. burning them.

JERUSALEM ARTICHORE: P. N. You will find at p. 151 of the Gardeners' Chronicle, January 31, 1891, a note from Canon Ellacombe, which shows that in the seventeenth century the name Girasole was applied to the Ricinus or Palma Christi, and not to the Jerusalem Artichoke.

MALFORMED FUCHSIA BLOSSOM: G. H. H. The malformation is due to some check in an earlier stage of growth.

MELON FOLIAGE DISCOLOURED: G. W. II. The appearances are not of fungoid origin, but they point to either lack of timely vertilation after the sun has come out brightly, or to fumes from fer-menting stable-litter, or to defective panes of glass.

Names of Fruit: Tho. Kyte. 1, is probably Elton Cherry; 2, Waterloo do.; 4, Black Eagle do.; 6, Werder's Black Heart do.; 8, Bigarreau Napoleon do. Cherries, unless they are seen on the tree, are difficult of recognition.

Names of Plants: Correspondents not answered in AMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number. — R. W. W. Vanda teres. — W. W. Tillandsia (Anoplophytum) stricta. — W. H. D. 1, Indigofera Gerardiana; 2, Cedronella triphylla (true Ralm of Gilead); 3, Achillea decolorans; 4, Delphinium cashmirianum; 5, Cotyledon orbigaleta; 6, Sadum oppositifications tyledon orbiculata; 6, Sedum oppositifolium.— C. W. C. 1, Carpinus Betulus, Hornbeam; 2, Potentilla fruticosa; 3, Genista radiata; 4, perhaps Gaultheria procumbens; 5, Alnus cordifolia.—
K. D. Next week.—A. L. Next week.—C. Walva moschata, white variety.—C. M. 1, Magnolia conspicua, so far as we can tell without the flower; 2, Liriodendron tulipiferum, the socalled Tulip tree.—*Chester*. Euphorbia Lathyris, the Caper spurge.—*F. F.* 1, Funckia ovata; 2. Potentilla atrosanguinea var.; 3, Cytisus capitatus; 4. Acer pictum var. rubrum, the A. colchicum rubrum of gardens; 5, Acer dasycarpum var.; 6, Epilobium lancifolium, white.—X. F. Schizanthus pinnatus. — X. F. Allium Moly. — W. J. W. Utricularia vulgaris.—C. H. J. 1, Thalictrum minus: 2, Campanula next week: 3, Dactylis glomerata variegata; 1, Geranium pratense, double; 5. Lysimachia vulgaris; 6, Œnothera Frascri; 7. Hesperis matronalis.

Poor-flavoured Melons . L. A. M. The fruits were either not true to name or the cultivation was at fault, or both. Good varieties are very frequently spoiled in flavour by the excessive application of water at the root, made with the idea of obtaining great size in the fruits, and this end is reached at the expense of flavour.

REPORTS OF MEETINGS: J. D. S. Brief accounts of such society meetings are very acceptable.

Spruce-Galls: A. P. H. The galls are the work of an insect—Chernes abietis. They greatly disfigure and injure the tree. Cut off the affected shoots so far as possible, and burn them.

STRAWBERRIES: Sir C. S. Carolina superba.

TOMATO CULTIVATION," BY MR. GRAY: P. F. S. We cannot inform you if the paper you mention will be published; and we should advise your applying to the secretary of the society for information on this head.

VRIESEA-VBIESIA: O., Amsterdam. The Index Kewensis, which is henceforth our guide till a more excellent way is shown, writes Vriesia, which we presume, was the original spelling of the founder of genus, and which is perhaps more classical. Vriesea is more in accordance with the verna glar. Trem orum maris accipe:

AND SIMPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitand Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to II. G. CGVE, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements.

HUDDERSFIELD and DISTRICT CHRYS-ANTHEMUM SOCIETY.

The SIXTH EXHIBITION of the above Society will be held in the Town Hall. Huddersfield, on TUESDAY and WEDNESDAY, November 10 and 11, 1898. Schedules are now ready, and may be had on application.

Marsh, Huddersfield.

JOHN BELL, Hon. Sec.

Excerpt from " Edinburgh Gazette" of July 3, 1899

TOTICE IS HEREBY GIVEN that the Firm of ICEA S DEREID (IVEN that the Firm of CROSS AND DONALDSON, SEED, OLICARE, and MANURE MERCHANTS, Edinburgh and Beifist, of which the Subscribers were the sole Partners, has this day been DI SOLVED by mutual consent.

The Subscriber JOHN DONALDSON, is authorised to Collect all Debts due to, and will Pay all Debts due by, the Firm. June 20, 1896.

June 30, 1896.

ALEXANDER CROSS, JOHN BLAIR, of 28, Charlotte Square, Edinburgh, Writer to the Signet, Witness.

ARCHO LIVER, of 28, Charlotte Square, Edinburgh, Solicitor Supreme Courts, Witness.

I take this opportunity of informing you that I inteod carrying on the business of Wholesale Seed Merchant as hitherto, at my late firm's address, 24, St. Giles Street, Edinburgh, nuder the style of JOHN DONALDSON & CO., and I trust to marit a cootinuance of your favours—I am, Yours faithfully, JOHN DONALDSON.

Yours faithfully, JOHN DONALDSON.

SPECIMEN GREENHOUSE TREES and PLANTS.—Noblemen or Gentlemen having in their possession Large Trees or Plants that have out-grown their available space, and which they would be wilhing to present to the New Public Wioter Garden, lately completed at Sefton Park, Liverpool, about to be handed over as a gift to the Lord Mayor and Corporation of that city, are requested to communicate with Mr. H. HEBEERT, Superintendent of Parks and Gardens, at Liverpool, who is authorised to defray all expenses attending the removal of any accepted plants.

The Plants most desired are the following:—Palms, 15 to 20 feet high, and big in proportion, and has been built by Messrs. Mackenzie & Moncue, of Edinburgh, with every modern improvement, a happy home will be secured for any Trees or Plants presented as above Address, Mr. HENRY HERBERT, Superintendent's Lodge, Setton Park, Liverpool.

ORCHIDS — ORCHIDS.

Clean, healthy, well-grown plants at reasonable prices; many large specimens and rars varieties.

CHOICE DENDROBES A SPECIALTY. PLEASE WRITE FOR LIST,

JAMES CYPHER. EXOTIC NURSERIES.

TENTS! TENTS!! TENTS!!! — I bave TENTS! TENTS!! TENTS!!!—I have purchased 5000 ARMY TENTS (40 ft. circumference), scarcely used. Complete with poles, pegs, and lines. Cost £3 each, Will send any number, carriage paid, for 28s, each; inferior qualities, 22s, and 24s, each. Cesh with order; can be sent on approval. Specially adaptable for sporting and pleasure purposes. TWO JUST SUPPLIED TO BUCKINGHAM PALACE. The following unsolicited testimonal is one out of many hondreds weekly:—

"April 29, 1896. Dear Sir,—Accept my thanks for the tents, safely received to-day. I am very pleased with them.

"F. H. HILL, Duddingston Park, Portobello, Midlothian." MARQUEES for Flower Shows, Sports, &c.—Mada of best Tent Canvas, 30 feet by 16 feet, with Poles, Pegs, Rnnners Lines, Mallets, and Bags, all complete, ready for use, cash £14, cost £236.

ANDREW POTTER, Melbourne Works, Wellow, and in the content of the cost £24.

SAVACE & SON, PLASHET NURSERY, EAST HAM.

MUNGO CHAPMAN, late of Easter Duddingston Lodge, Mid-Lothian, begs to intimate to his friends and acquaintances that he retires from his present situation on the 20th of the present month. He has arranged to reside at St. Niciana, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the management of one of the most choice private collections of plants to be found in the British Isles—that of the late Charlee Jenner, Esq.—Mr. Chapman can confidently undertake to supply what is select and true to name of the most cuitable plants for Borders and Rock-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully amployed in getting up Stock.

May 19, 1896.

SATURDAY, JULY 18, 1896,

RIDGEMONT FRUIT FARM.

N the 9th inst., at the invitation of the Duke of Bedford and Mr. Spencer Pickering, a party of scientific men visited the experimental farm established by the Duke to settle various controverted points of practice, to ascertain which varieties are best adapted for commercial purposes and which most suited to local conditions. The cultural details are under the direction of Mr. Lewis Castle. The area occupied is about 20 acres, nearly level, rather exposed, and with a sandy loam soil overlying the Oxford clay. On a hot dry July day the soil was dusty, but in wet weather it is said to become pasty. The plantation has been established little more than a year, so that some considerable time must elapse before any definite results can be arrived at. In the meantime, the establishment is a model of good cultivation, and thus already affords an excellent object-lesson. The ${\tt experiments} have been planned and {\tt carried} {\tt out}, {\tt so}$ far as circumstances will allow, with scientific precision. The soil has been analysed, and careful records taken, so that we shall ultimately have for fruit as exhaustive a mass of information as is now available at Rothamsted in the case of agricultural crops. Only a comparatively few varieties of each kind of fruit are grown (unless in the case of Strawberries). In this way the risk of the whole experiment breaking down under its own weight is partially obviated. But even under existing circumstances, the collation of the evidence obtained will be a serious undertaking. The general scheme of the experimental trials may be gleaned from the following notes.

At the present time the most striking features are those plots which are designed to show the effect of neglect. Two long plots are very conspicuous is this respect, the one where the planting has purposely been badly done and uo care taken subsequently, the other where weeds of all kinds have been allowed to grow on the plots-the result of the struggle for existence in both cases is most striking throughout the whole length of the plots. The unfortunate fruit-trees are rapidly succumbing to starvation and other adverse circumstances.

A few miles off a series of experiments on agricultural crops has been carried on for some years under the auspices of the Royal Agricultural Society on the Duke of Bedford's land, under the direction of Prof. Voelcker, and on the same general lines as those at Rothamsted. So far as the action of manures is concerned, the results are broadly like those at Rothamsted, with slight variations from different local conditions.

Among other experiments are some made with a view of explaining the causes of Clover sickness, by inoculating the soil with bacteria from various leguminous plants, and then growing Clovers on the soil so treated. At

present the results are not conspicuous, but a crop of Lucerne is flourishing on land which will not at present carry Clovers. Considering the dearth of such experiment stations in this country, and the extreme importance of the results to be obtained, it is highly gratifying to see such work being carried out, work which will lay the cultivators in this country under profound obligation to the Duke, by whose enlightened direction the scheme has been thought out, and is in progress of realisation.

APPLES.

Dwarf Trccs. — For the following experiments (Nos. 1 to 180) dwarf Apple-trees on a broad-leaved Paradise stock have been planted. The trees were all three years old when planted, eighteen trees being taken for each experiment. Six of these are Bramley's Seedling, six Cox's Orange Pippin, and six Potts' Seedling, these three varieties showing marked differences of habit. The distance allowed between neighbouring trees is 11 feet in all cases, except in that of Bramley's Seedling, where the distance has been increased in one direction to 13 feet 6 inches to suit the more vigorous habit of this variety. Every set of eighteen trees devoted to each special method of treatment is planted in a line running across the three plots.

There are six experiments in which the treatment of the trees will be normal, and these are distributed at about equal intervals down the plots, so as to ascertain whether trees, when similarly treated, yield the same results, independent of their position in the plots.

Treatment of Branches.—The results to be compared here are those produced by different methods of dealing with the branches, as regards cutting-back, pruning, and pinching. Moderate and hard-pruning will be compared; some trees will have the growths pruned, but not pinched; others will be subjected to the reverse treatment; while in one experiment the branches will not be shortened in any way. The different effects of branch and shoot reduction in summer and antumn will also be compared.

Treatment of Roots.—Root-pruning is the subject of investigation in these plots. Some trees will be pruned annually, others every second or fourth year, and some only when it appears to be necessary. In one experiment, lifting the trees without (as far as it is possible) injuring the roots will be tried; and in another, the roots will be neither pruned nor disturbed in any way.

Treatment of Surface-soils.— In these five experiments it is intended to ascertain the effects on trees of loose or hard surface-soil, and also the differences produced by the soil being occupied with other plants. In one instance the ground is heed and covered with straw, in another grass is grown and cut, in a third the surface is hardened, in the fourth the soil is dug close to the roots, and in the fifth weeds are allowed to grow.

Manures.—The different effects of artificial and farmyard-manure will be examined in these plots. As regards artificial manures, the separate and combined effects of the three chief food-substances—nitrogen, phosphorus, and potassium—will be examined, as well as that of other substances, the influence of which is at present less known.

Amount of Manure.—Here the amount of manure applied will be varied, and the results compared with those from an unmanured plot, and also from one in which the quantity of manure supplied is increased every year.

Time of Applying Manures.—In the majority of the experiments where artificial manures are supplied, the mineral manures will be used in the autumn, and the nitrogenous manures in the spring; but in these experiments the effect of the time of application of the dressings will be investigated by selecting different periods of the year for their application.

Methods of Planting. — Three experiments are d voted to the illustration of the effects of bad methods of planting and neglect. The first series

of trees will receive ordinary treatment in all respects except in being badly planted; the second are badly planted and neglected, hut will be manured; while the third are badly planted, neglected, and will not be manured. In the other plots, the effects of planting in ground dug only I spit deep, in ground dug 2 or 3 feet deep, and in holes with chalk bottoms, are investigated, as well as the effect of high and low planting.

Planting in Different Soils.—In these instances the stations for the trees were specially prepared and filled with earth mixed with chalk, stones, gravel, peat, or rich compost.

Times of Planting.—Comparison is here instituted between trees planted in autumn, winter, and spring.

Removing Flowers.—It is intended to remove all the flowers from these trees for several years to test the effect of so doing on their after-growth and produce.

Damaged Trees.—Some of the trees planted here were severely barked by hares, others were rejected from preceding experiments for various bark and wood injuries, indications of canker, &c. They will receive ordinary treatment, and be compared with healthy uninjured trees.

Some of the above-mentioned experiments are being repeated with a fourth variety of Apple—Stirling Castle—which is a weaker grower than any of the three varieties just mentioned. The distance between the neighbouring trees in this case is 6 feet 6 inches.

Standard Trees.—Similar experiments are also being made in some instances on standard Appletrees grown on the Crab-stock. Each experiment in this ease, is made on six trees of Bramley's Seedling (Nos. 189—199), six of Cox's Orange Pippin (Nos. 201—211), and six of Lane's Prince Albert (Nos. 213—215): these were all four years old when planted.

Different Methods of Training.—The irregular spaces at the top of the field have been utilised for experiments on different methods of training. From six to twelve trees of each of three varieties of Apples have been planted for each experiment. The varieties are:—Bramley's Scedling, Cox's Orange Pippin, and Stirling Castle—all on a broadleaved Euglish Paradise stock; but in this case the trees were planted as maidens, instead of three-year-olds. With the horizontal espaliers the trees will be trained so as to point in four different directions, in order to determine the effect of different aspects. Bushes, bowl-shaped and pyramidal trees; espaliers, cordons.

Varieties of Apples.—As it was found impossible to obtain the number of varieties of Apples required all of the same age, and all on both the Crab and broad-leaved Paradise stocks, a number of these stocks have been planted, which will be budded or grafted when ready for these operations. About 120 varieties of Apples have been selected, and of each of these there will eventually be eight trees, four on each of the two stocks. Two of these will, in every case, be subjected to severe pruning, and two to very slight pruning. The trees will also be so arranged that, by dividing the plots lengthwise, they will form two precisely similar halves, on which the effect of different insecticides may be tried.

STRAWBERRIES.

On the north-east border of the ground thirteen plants of each of eighty varieties of Strawberries have been planted. From these runners will be taken, and fresh rows planted annually 2 feet from the previous ones, so that ultimately each variety will be represented by plants of five different ages. Data will thus be obtained for the comparison, not only of different varieties under similar treatment, but also of the same variety at different periods of its life.

Supplementary plants of the different varieties have been planted between the Apple-plots in spaces which will eventually be used for paths. London manure, at the rate of 30 tons to the acre, has been used for all the Strawberries.

The different varieties are not at present in a

strictly comparable condition, owing to their not having been planted at the same time, and owing to some of them, chiefly those planted late, having been weakly when planted.

DEMONSTRATION PLOTS.

Three half-acre plots are devoted to demonstrating how ground may be advantageously cropped with fruit by farmers, growers for market, and cottagers, respectively.

THE ARRANGEMENT OF TREES.

Near the garden-house three plantations of bush Plum-trees have been formed, with the object of ascertaining the respective merits of different systems in which the same number of trees may be arranged in a given space.

Each plantation consists of 36 trees—12 Monarch, 12 Czar, and 12 Vietoria—surrounded by trees of Rivers' Early Prolific for protective purposes.

Each plantation represents an arrangement giving 1210 trees to the acre, and therefore, every tree has the same amount of space allotted to it.

HEDOES

About 3600 feet of hedgerows have been planted, with the primary object of forming a protection from the wind, and with the secondary object of ascertaining the economic value of different fruit-trees grown in this way. The distance between the trees in these hedges varies from 2 to 6 feet.

LOCAL APPLES.

Collections are being formed of varieties of Apples which are characteristic of particular localities, or which have originated in other countries, and are little known here, the object being to ascertain whether any of them are worthy of more extended cultivation in this country. Varieties of Scotch Apples, varieties of Irish Apples, Apples of Continental origin, comprising French, German, Italian, and Russian varieties.

THE NURSERY.

Part of the ground on the south side of the brook is laid out as a nursery, and planted with stocks for budding or grafting. These include Crab, Paradise, Pear, Quinee, Hawthorn, and Cherry-plums. Other spare parts of the ground have been put to a similar use.

TREES AND SHRUBS.

A collection has been commenced of species and well-marked varieties of Prunus, Pyrus, and Cratægus, together with other members of the natural order of Resaceæ, partly to form an ornamental border between the nursery and the brook, and partly with a view to experiments in raising seedlings for stocks, and for other purposes. The forms arranged under Prunus include Almonds, Peaches, Plums, and Cherries, representing the sections Amygdalus, Armeniaca, Prunus, Cerasus, Padus, and Laurocerasus.

The forms of Pyrus include Pears, Apples, White-beams, Mountain Ash, Quinces, and Medlars, representing the sections Pyrophorum, Malus, Aria, Adenorachis, Sorbus, Cydonia, and Mespilus.

The forms of Crategus are planted near the north-west end of the border, and at intervals are collections of Ribes, Ruhns, Spirca, Berberis, Philadelphos, Syringa, and Labaranum, with other trees and shrubs valued chiefly for their flowers or foliage. The banks of the brook and the borders will be devoted to various plants adapted for such situations.

On the north-west side of the farm are planted a number of quick-growing trees for shelter, chiefly varieties of Poplar, Maple, and Lime.

VIOLA BECKIANA (F. Fiala).—In the current number of the Wiener Illustrirte Garten Zeitung is a coloured figure of a new species of Viola from Bosnia. It has erect, slender stems, linear leaves, and very narrow stipules, with flowers suggestive of those of V. cornuta, but with a much shorter spur. There appear to be two forms, one with bluish-lilae flowers and a yellow eye, the other with sulphur-yellow flowers.

NEW OR NOTEWORTHY PLANTS.

EPIDENDRUM XIPHEROIDES, Krzl., n. sp.*

PLATE 111 in the highly esteemed Refug. Botanicum, represents under the name Epidendrum xipheres, Robb. f., a plant from which our species differ by its much larger bulbs and the smaller flowers of a different colour, but with which it agrees very well in the most important botanical characters. The general shape of the bulbs, the narrow thick leathery leaves, the arrangement of the flower-stalk, also the peculiar glassy warts on the ovary, the most striking of all characters, are about the same in both species, but there end the affinities. The sepals are lanceolate, the petals linear, both of them dark green, with sordid purplish lines, the lip is very prettily goldencoloured with a thick whitish callus, hollowed on its surface, from which five thick elevated lines run through the anterior part of the lip. The side-lobes are very small and inconspicuous. The plant is said to be of Brazilian origin, and flowered with Mesers. F. Sander & Co., at St. Albans. F. Kränzlin.

CYRTOCHILUM MICRANTHUM, Krzl., n. sp.†

This plant resembles in every respect a small flowering form of the old Cyrtochilum maculatum, Lind. The lip, however, is quite different, its lateral lobes being well developed, and the middle one larger, obevate, and rounded at the top. In all specimens of true Cyrtochilum maculatum, the side lobes are small and confluent with the lip itself, and the anterior or middle lobe goes out into a sharp point. As the crowd of varieties ranging under the collective name of Cyrtochilum maculatum has increased to the amount of a small genus, I believe it is better to establish a new species, if we have a tolerably good character to separate it from the typical forms. Such a character we find in the lip. The colour is not very pleasing; it is, in short, that of the paler-coloured varieties of Cyrtochilum maculatum; the lip, however, has also its peculiarity, the base being white, with two pale chocolate-brown blotches running sometimes together into a broad brownish band, the anterior half being pale yellow. The plant was introduced from Brazil; it flowered in June with Messrs. Sauder & Co., at St. Albans. F. Kränzlin.

Odontoglossum luteo-purpureum Ashworthianum.

This is an extraordinarily beautiful variety, and one of the largest of the coloured Odontoglossums, its flowers being 5 inches across the sepals from tip to tip, and $4\frac{1}{2}$ inches across the petals, all of the segments being broad, and of a similar thick texture to that usually found in O. triumphans, which in other particulars this variety resembles. So great is the resemblance that cursory examination of the flower would suggest a hybrid of that species. But the lip, although larger than usual, has the unmistakable crest of that form of O. lutee-purpureum known in gardens as O. hystrix. The sepals are of reddish-chestnut-brown,

with clear citron-yellow tips, and one or two yellow spots at the base. The petals are of a creamy-yellow tint on the inner halves, and citron-yellow at the tips, and they bear three large and a few small red-brown spots, and a purple ray at the base. The large fringed lip is of primrose-yellow colour in the front, and red-brown in the middle, in front of the handsomely-toothed and fringed white, yellow, and purple crest. It flowered with Elijah Ashworth, Esq., Harefield Hall, Wilmslow, Cheshire. James O'Brien.

ORCHID NOTES AND GLEANINGS.

CATTLEYA WARSCEWICZII, VAR. SHUTTLE-WORTHII.

This noble form of the plant, at one time known as C. gigas, made a great stir when it first flowered; and despite the large numbers since imported, it is pleasing to see that it maintains its good reputation. The flower is large, and the rich purplish-rose of the sepals and petals, and the dark, velvetty crimson-purple hue of the broad front lobe of the lip, make it a very gorgeous object, the bright dark purplish-rose veining of the exterior of the side lobes of the lip being additional beauties. The original plant, now in Lord Rothschild's collection at Tring Park, is carrying a grand six-flowered inflorescence. Other showy plants, viz., C. > Hardyana Laversinensis, and another very fine form of C. > Hardyana, are also in bloom at this place. J. O.B.

CATTLEYA GASKELLIANA, BANK HOUSE VAR.

This very fine variety is flowering in the collection of Mrs. Briggs-Bury, of Bank House, Accrington (Mr. J. Wilkinson, gr.). It is what is called in gardening phraseology, a "good square flower," well filled up in all its parts, and is remarkable among others for great substance and breadth of petal. The flower itself measures 71 inches across, and the breadth of the petal just touches 3 inches. It is of a fine rosy-lilac shade, the sepals and petals being alike in colour. The colour of the lip differs from the type, in having a brilliant yellow (not lemon) bletch on the epichilium, surrounded by roseatepurple lines, and edged with blush-pink; the interior of the lobe has grand rayed crimson-purple lines, the expanded portion of the lip measuring 2 inches by 2 inches. A comparatively small plant is bearing on one spike three equally fine flowers, partaking of the mixed character of C. Mossiæ and C. Gaskelliana. This Gaskelliana division of the Labiate Cattleyas comes in after C. Mossiæ, which is preceded by C. Schroderi, and by C. Trianæi, and is generally followed by C. Rex, and by C. labiata itself, which, along with others, provide a continued cycle of Cattleya flowers in anything like a good collection. J. A.

CHEMISTRY OF THE APPLE.

The research work connected with the chemistry of the Apple was commenced at the Ottawa Experimental Station in 1889, and has been continued up to the present time under the direction of Mr. Frank T. Shutt, M.A., F.I.C., F.C.S. The investigation was undertaken with a view of eliciting such information as would assist the intelligent orchardist in a rational method of fertilising. When the nature and amount of plant-food required by the Apple tree in bearing is known, the first steps towards the manuring question will have been taken.

The analytical work began by taking the Appletree leaves of the following five varieties: Duchess of Oldenburg, Tetofsky, Wealthy, Fameuse and Northern Spy; these were plucked at two different stages of growth, and their composition determined. This investigation has been continued by the chemical examination of the Apple fruit of four of these varieties.

The mineral matter and nitrogen—which together constitute the plant food taken from the soil—annually assimilated are represented by the increase of wood, the leaves and fruit. That contained in the

leaves is, or may be, practically all returned to the soil, that removed by the gathering and marketing of the crop is shown separately.

In order, however, to present the subject of orchard requirements and fertilisation in as complete a way as possible, as well as for the sake of comparison, the following table of the composition of Apple-tree leaves is first given.

ANALYSES OF APPLE-TREE LEAVES.

Composition of the leaf; Percentage composition of selected and important constituents in ash.

Composition of the Leaf.

Name,	When Gathered.	Moisture.	Organic Matter.	Ash.	Nitrogen in Organic Matter.
Duchess of Oldenburg	May 25, '89	70.94	26.67	2:39	2.87
Tetofsky	,,,	72-11	25:40	2:49	2.84
Wealthy	1.7	$71\ 25$	$26^{\circ}84$	1.91	2.88
Fameuse	,,	75.45	22.01	2:54	3.01
Northern Spy	.,	72.04	25.62	2:34	2.99
Average		72.36	25:31	2:33	2.94
Duchess of Oldenburg	Sep. 20, '89	57:30	38:75	3 95	2:48
Tetofsky	,,	60:49	35.87	3.64	2:20
Wealthy	,,	60.02	36'53	3:45	2:38
Fameuse	,,,	63 45	33.15	3.40	2:50
Northern Spy	,,	62:30	34.85	2.85	2.84
Average		60.71	35.83	3 46	2.48

The data thus given are very striking, and show that as maturation of the leaf progresses these organs of assimilation cease to store up moisture and nitrogen, but increase their organic matter and ash constituents. It will be seen that the moisture in the leaves has decreased between May 25 and September 20, on the average, II-65 per cent., and the nitrogen has decreased about half a per cent. On the other hand, the organic matter has increased during the same period, on the average, I0-52 per cent., and the ash has increased 1-13 per cent.

The next division of the table illustrates the mineral composition of the leaves, as shown by the constituents in the ash.

Percentage Composition of Important Constituents in the Ash of Apple-tree Leaves.

Name.	When gythered.	Phosphoric Acid.	Potash.	Lime.	Magnesium	Oxide of Iron.	Silica.
Duchess of Oldenburg	May 25	9.67	9.25	21.20	9:56	1.63	0.92

The variation shown in the same constituent by the five different varieties of Apple-tree leaves gathered on the same day is very considerable, whether taken at the earlier or the later date; but the effects of exhaustion are very strikingly brought out by a study of the figures showing the amounts of lime taken up and accumulated, with a corre-ponding decrease of phosphoric acid and magnesia, these latter ingredients passing into the sap of the tree for the formation of fruit and the ripening non-nitrogenous centituents.

^{*} Epidendrum xipheroides, Krzl., n. sp.—Aff. Epid. xipheri, Rehb f. Bulbis magnis ovoideis v. obpyriformibus, 7 cm. altis, 3.5 cm. diam., apice diphyllis; foliis linearibus acuminatis crasissimis cartilagineis canaliculatis ad 20 cm. longis ad 1 cm. latis; racemo tenur paucifloro; bracteis subuullis; ovartis brevi-pedicellatis cicatricibus hyaliums dense obtectis; sepalis lanecolatis acutis lateralibus latioribus; petalis linearibus apicem versus paulo latioribus æquilongis omnibus acutis; labelli lobis lateralibus brevibus obtusis, lobo intermedio late oblongo (fere quadrato) marxime undulato callo disci elevato carnoso supra exacato antice in lineas 5 elevatas carnosas exeunte; gynestemio basi cam labello coalito supra lato marginato, ceterum generis. Krānzlin.

[†] Cyrtorhelum micranthum, Krzl., n. sp.—Affine C. maculato, Lind., differt floribus minutis vix 2 cm. diametro et labello; labelli lobis lateralibus bene evolutis rotundatis, lobo intermedio obovato-oblongo antice rotundato lineis in disco 4 dentes aquales inter ipsos lobos laterales formantibus, lineis lateralibus brevioribus, callo didymo in ipsa basi; gynostemii alis subnullis. Sepala petalaque viridia apicem versus lutesceutia maculis magnis bru eis notata, labellum basi album a medio apicem usque luteo macula magna bunnea utrinque, lineis c'evatis violaceo marginatis. E. Brasilia importata dicitur; floruit Verulamii, Junio, 1896. F. Kränzlar.

Passing ever the enermons differences in the amounts of the various constituents taken up and retained by the different varieties of Apple-tree leaves, we see there is an average reduction in the phosphoric acid of 4.65 per cent., an average increase in lime of 10.51 per cent., and an average decrease in magnesia of 4.96 per cent, between one period of cellection and the other.

These figures serve to show the absolute necessity of a complete and full supply in the seil of available mineral constituents in the earlier or merely vegetative stages of Apple-tree growth, if an abundant crep of fruit is to be obtained.

COMPOSITION OF THE FRUIT.

The general composition, namely, the percentages of water, organic matter, and ash—which make up the whole, and the amount of nitrogen, are given for the four varieties of Apple examined in the following tabulated form:—

Analysis of Apples.

Variety of Apple.	Water.	Organic matter.	Ash.	Nitrogen
Duchess of O denburg	88:61	11:14	0.25	· 0 382
Wealthy	87:00	12.71	0.55	.0375
Fameuse	85:22	14:46	0.35	0.712
Northern Spy	87:08	12.65	0.27	*0445
Average	86:98	12:74	0.58	'0428

Although there is a great similarity in composition in the varieties examined, and none differ much from the average deduced from them all, it is of interest to note that the Fameuse is the richest in organic matter, in ash constituents, and in nitrogen. The Wealthy and Northern Spy contain almost identical amounts of organic matter and ash, and the Duchess of Oldenburg has the largest percentage of water, and lewest percentage of organic matter and ash.

Percentages of Important Constituents in Ash.

Variety of	Apple		Phosphoric Acid.	Potash.	Soda.	Iron Oxide.	Lime.	Magnesia.	Silica.
Duchess of Ol	denb	ırg	8 20	53 67	3.28	1:77	5*80	5 20	0.36
Wealthy			8.15	57:00	2*65	1.76	3.33	3.84	0.63
Fameuse			7.19	56 25	2.56	1.26	3 55	4:03	0.32
Northern Spy			11.68	54'11	1.94	2.13	3.86	3.99	1:11
Avera	ige		8-98	55 26	2.61	1.72	4:38	4 27	0.60

In this table the composition of the ash is given in detail. Of its components, phospheric acid and potash are the principal. The latter constitutes over half of the ash (55.26 per cent.), while the former is about 9 per cent.

No great differences between the varieties are here to be noticed, though the Northern Spy presents some striking variations from the average. Its ash contains nearly 3 per cent, more phosphoric acid, nearly 1 per cent, less soda, about 0.5 per cent, more oxide of iron and alumina, and about 0.5 per cent, more silica thau the ash of the other Apples.

The ratio of the potash to the phosphoric acid in the ash of the fruit is 6 to 1; in the ash of the older leaves (see Table II.) it is 2 to 1. Relatively, therefore, the demands of the leaf and the fruit on the soil for these two constituents are very different. It might here be remarked that the greater quantity of the ash ingredients of the fruit is contained in the seeds and walls of the every, comparatively little being found in the flesh of the Apple.

A comparison of the last table with that showing the composition of the ash of the leaf will reveal further interesting features. The total percentages of ash in similar weights of leaf and fruit are as 3.46 to 0.28. Lime is much more abundant in the ash of the leaf, while magnesia, oxide of iron, and silica are about the same, taking the older leaves for comparison. For the purpose of a practical presentation of the

subject, the data given in the fellowing table has been prepared:—

Weight of Important Fertilising Constituents withdrawn from the Soil in the Growth of Apples.

		Average weight	Lbs. [er Acre, Barrels.	
Variety of Apple.	,	per Bushel	Nitro- gen.	Phos- phoric Acid.	Potash.
Duchess of Oldenburg	Lb. 44	Lb. 7:36	Lb. 4:31	Lh. 25.98	
Wealthy		50	8.22	5.18	36:23
Fameuse		50	11.22	5.04	39:46
Northern Spy	•••	46	9.01	6.38	29:57
Average		47.5	8.95	5.23	32.81

In the above calculations the following data are used: Forty Apple-trees per acre in an orchard twenty-five years old yield, on an average, one hundred and sixty (160) barrels. One barrel centains 2 bushels and 3 pecks.

We have here shown the number of pounds of nitregen, phosphoric acid, and potash estimated as centained in 160 barrels of Apples, and removed per acre by a good crop. None of the quantities are at all excessive, and the cost of returning them to the soil would not be great. The largest demand is on the potash in the soil; next comes the nitrogen, and lastly the phosphoric acid. In the case of the leaves, the nitrogen stood first in order of requirement.

For the vigorous development of the tree and an abundant crop of fruit, the soil must contain these constituents in a more or less immediately available condition. It is for this reason, as well as to replace the exhausted plant-food, that fertilisers are necessary to profitable Apple-grewing.

Nitrogen.— To supply nitrogen, some organic manure is perhaps the most economical. Farmyard or stable manure are to be recommended. Besides adding nitrogen, they furnish humus or decaying vegetable matter, which serves a useful function by liberating carbonic acid, and which in turn sets free locked-up forms of mineral food. Humus, mereover, has much to do in bringing about amelioration of the soil, and the retention of soil-moisture. As the period of growth and fruit-development in the Apple is comparatively long, organic manures in most instances will probably give better results than those containing more soluble forms of nitrogen, such as nitrate of soda or sulphate of ammonia.

Potash and Phosphoric Acid.—To furnish potash and phosphoric acid, we would first mention woodashes, where obtainable, as these possess the ingredients in the relative proportion best suited to fruit-tree requirements, and in a condition that renders them easily available.

If wood-ashes are not obtainable, kainit salt and sulphate of potash may be substituted to supply petash; and hone-meal, basic slag, or superphesphate the phospheric acid. Bone-weal contains from 2 to 3 per cent. of nitrogen, in addition to the phosphoric acid, but requires a greater length of time in the greund to give up its constituents; its effects naturally last longer. For this very reason it is often advocated for orchard manuring.

Both weod-ashes and bene-meal furnish lime, which we have seen to be a necessary and somewhat important element. Soils differ so much in composition, that it is impossible to state definitely the amounts of the foregoing fertilisers that should be employed in all cases. The wants of the Apple tree for fruit and leaves have been given, and the principles for an economical return of these requirements indicated.

In conclusion it may be said that the best and most profitable crops can be obtained only when the seil contains what might be thought to be a large amount of plant-food, the greater part of which is more or less assimilable. An ameliorated soil, among other advantages, tends to a good root development. In such, the rootlets are able to procure food from a nuch larger area than otherwise; but in every

erchard, owing to the disposition of the reots, there must of necessity be much unoccupied soil, and hence the importance of supplying liberally and in excess of that which is absolutely needed for a season's growth and fruit, those forms of plantfood which we have been considering. J. J. Willis, Harpenden.

COLONIAL NOTES.

CEYLON BOTANIC GARDENS.

Dr. Trimer, who has conducted these gardens with so much success for several years, is, we regret to say, compelled to resign his appointment by reason of his impaired health.

Tea.—This year has, according to the last Report, been a most favourable one for Tea; the yield everywhere has been good, and the increase in exports greater than was anticipated. The total expert was 98,581,061 lb., against 84,591,714 lb. last year, showing the very large increase of over 13,000,000 lb. (nearly as much as the whole crop of 1887). The area now covered with Tea is estimated at over 300,000 acres, and a small but steady extension is still going on. The average price remained much as in 1894, i.e., about 8½d. per lb., or perhaps a little more. It is gratifying to see a substantial increase in the export to Australia, which attained over 9,000,000 lb. (9,109,592 lb.) during the year.

Coffee.—A remarkable and interesting fact is a large increase in the export during 1895, this being more than double that of 1894, viz., 65,833 cwt. This is the first time for many years that this has occurred. A gratifying circumstance, too, is that 6,076 cwt. of this is "native" Coffee—nearly four times the amount of last year. It is to be understood that the increase is due not to any increased acreage, but to better crops; probably with less chances of infection, Coffee has now to bear fewer "attacks" of leaf-disease, and so is able to ripen more fruit. Liberiau Coffee, however, as yet shows no increase; but this seems likely to be altered in the future, as a considerable area has been planted in recent years, and mostly appears to be doing well.

Wild animals—Monkeys.—A group of monkeys, six or seven (the large wanderoo) which frequented the gardens for some time without doing much damage, suddenly (in May) became destructive to the large Flame tree (Sterculia acerifolia) by breaking off the young succulent shoots. I tried shooting at them with small shot to drive them away, but they would persist in ceming to this tree, so that I shot one with a bullet. They then remained away for a few days, but began their destructive work again, keeping out of my way, and I was unable to get another shot. They nearly ruined the tree, which was a fine one, and the largest we had in the gardens.

Sambur Deer were also very troublesome during May and June; in fact, the damage done was serious, as they ate or broke down nearly all the plants in the back of the shrubbery for a distance of about 200 yards, shewing a special liking for Fuchsia, Habrethamnus, Balsams, Begonia, Iresine, Polygonum, Tecoma, Anthericum, and other liliaceons plants, and we were very thankful when Messrs. Jackson and Mr. A. J. Kellow sent in their packs of hounds and hunted them out.

Elephants.—Five elephants were in close proximity to the gardens for several months of the year, and during Angust and September they paid several visits to the upper part and broke down and destroyed a few lengths of the water-piping. It is very interesting, especially to visitors, to know that wild elephants are so close, and, unless they do any serious damage, I think it would be a great pity to have them shot.

The Report further alludes to the danger of the extermination of some of the rarer and more showy Orchids, especially Dendrobium Macarthiæ. The Government has i-sued an order forbidding their collection in the Crown forests without a special permit, which will be issued only on the recommendation of the director.

Mysore Government Gardens, Lal-Bagh.

Mr. Cameron, the superiotendent, has issued his annual report. The unusual drought caused much extra labour, but the efficiency and beauty of the gardens were well maintained.

PROGRESS IN THE HYBRIDISA-TION OF ROSES.

I have continued my labours every season up to the present one, 1895, in which, I am sorry to say, I was able to do very little. Next year, if I am alive, I fear that my doings will probably be still less. Not that my faith is shaken in the belief that new races of Roses may be brought into existence by crossing or hybridising the existing races, which will be valuable additions to our present possessions; but the pressure of advancing years is imperative. Unless I did the entire operation with my own hand, the necessary interest in it would be lacking, and in my eightieth year the needful energy for this begins to fade.

With regard to what I have achieved, I think I shall have done much if I do no more than establish the one great fact that the different races of Roses, however apparently opposed to one another in wood and spine, in habit of growth, in foliage, in hardihood, and all other autward characteristics, are capable of uniting in the production of a common progeny—a progeny which is distinctly different from either parent, though generally bearing undeubted proofs of their origin in traces of both seed and pollen parent.

The successful results of my attempt to combine the sweet foliage and the hardy constitution of the Sweet Briar with the red and yellow tints of the Persian Yellow Briar and the Austrian Copper Briar, and not only so, but with the crimson tints of the Bourbons, the Hybrid Chinas, and even the Tea Roses, afford an excellent illustration of this truth.

As I have mentioned the Hybrid Sweet Briars, I will pause a moment to make known a fact which I only became aware of in this autumn of 1895. It occurred to me to have the hips of the Hybrid Sweet Briars cut off, and I only regret that it did not occur to me earlier in the season. They were already of a bright red colour, and formed very pretty objects, but I thought it would add to the strength and health of the plant to part with them. I certainly was not prepared for the result, for all the plants, with one or two exceptions, took to blooming freely a second time. During all August and September, and, indeed. until the arrival of the sharp frost in the latter part of October, I had three or four glasses of these blooms on my breakfast-table every morning, perfuming the room with the very sweet seent of their flowers. From this experience, I conclude that if the flowers were cut off as soon as they fade in summer, and the hips not allowed to form them. selves, the autumnal flowering would be still more remarkable and abundant.

But it is time that I passed from my successes to the admission of what have been very like failures. I had directed my attention to the production of a Hybrid Perpetual of a new colour. Why not a yellow? Aud, indeed, why not a blue Rose? As the possible parent of a yellow Rose, nothing preeented itself so naturally as the yellow Briar-the Persian Yellow and the Harrisoni. I collected a quantity of the pollen of these Roses, and operated on the blooms of several Hybrid Perpetuals, notably General Jacqueminot and Jean Cherpin. I obtained abundance of hips, and in due time plenty of seed, and again in due time, some hundreds of plants. But excepting perhaps in two or three cases, no sign is visible in their wood, foliage, or growth of the yellow Briar; no doubt the greater part of them have not yet flowered, but I confess my hopes of success with them is pretty well extinct. One plant, indeed. about three or foor years ago, did give nnmistakable signs of the Briar parentage, the foliage was almost identical with that of Harrisoni, and when the flower showed itself, it presented a very pretty mixture of crimson and yellow. But it was very shapeless, and out of a dozen blooms, there would perhaps be only one that in shape could be said to give any pleasure to the eye. Moreover, it proved itself to be very difficult to propagate by either bud or graft; it is even difficult to keep it alive, one branch after another dying down more quickly than they are reproduced. The plant seems, if I may use such an expression, to resent the attempt to unite such incongruous parents, and to make continual protest against its having been called into existence.

Then for the blue Rose I collected the pollen of a Hungarian Rose, "Erinnerung an Brod" by name. The tints of this Rose are more distinctly blue in parts, and at times, than those of any Rose that I have met with.

I have had no difficulty in obtaining plants from the pollen of this Rose with several of the Hybrid Perpetuals, and I have a number of them now. But none have yet bloomed; and I cannot trace, in the growth or foliage, any distinct evidence that the qualities of pollen parent are represented in the progeny.

On the other hand, I have a seedling Rose, obtained from a parent of the Semperflorens race, which has bloomed and given me a flower which at times comes almost blue, but it is flimsy, loose in its petals, and greatly wauting in shape: it is the most continuous bloomer, however, throughout the autumn that I have ever seen. What its true colour may eventually turn out to be it is not easy to say, for it is wonderful how seedlings change from their first form and colour as time goes on.

Another experiment must be recorded which up to the present time has not met with success. The beautiful glossy foliage of the Rosa camelliafolia is very inviting to the eye of the hybridiser, and if I could only transfer this foliage to some of our Hybrid Perpetuals, I should consider it a useful triumph. But I could not get the camelliafolia to flower. From what I have read in the gardening publications, I conclude that other people have met with the same difficulty. At last my opportunity came. The splendid sunny season of 1893 ripened the wood of my plant so thoroughly, that in 1894 it gave me twenty flowers. Two of these I treated with the pollen of other plants, but obtained no hips. The remaining eighteen I reserved for pollen, with which I fertilised the blooms of numerous Hybrid Perpetuals. I had a good erop of seed, and I have, perhaps, a hundred plants. In vain have I looked for a shiny leaf. Many of the seedlings have a foliage inclining that way, and certainly different from that of the seed parent, but none (unless as they grow up they put on a more glossy appearance) carry the true Camellia-like leaf which was the object of my

In another experiment 1 have succeeded much better; I allude to the hybridising of the Rosa rugosa. Of these I have several plants, and a precocious one has already, in its second year, shown me a very handsome flower.

I reserve to the last an attempt upon which, if successful, I should set the highest value, but of which I cannot yet announce the result. I allude to a possible cross with the wild Dog Rose. There is no more graceful and beautiful picture presented to us in the Rose world than that formed by the running shoots of the wild Dog Rose scrambling over the upper branches of a tall Thorn or Holly laden with their pretty pink flowers; and plants of this our native Rose with flowers perhaps improved, at any rate, varied, in colour and form, could not be otherwise than welcome. In the summer of last year (1894) I fertilised some hundred of blooms of the common Dog Rose (growing in the open air) with the pollen of some of our best Hybrid Perpetuals, and with that also of the Yellow Briar, and sowed the seed last autumn. Some at least of this seed, according to all my previous experiences, should have vegetated and come up this year, but none of it has done so. It may very well be that they will come up this next spring of 1896. Many Rose seeds do take two years before they germinate, as the Sweet Briar seed constantly does. But the failure of the whole lot to give

a single plant this year is ominous—dreadfully ominous. I only don't quite despair; I wish I had done the work under glass, and should have done so, but I was disappointed by not getting the needful plants in pots.

I do not call to mind any other experiments which would justify a specific account. I will only add generally that my work has produced a great number of very charming garden Roses, some of them of new and unusual colours. It has also called into existence many hybrid plants, in which the Musk Rose plays the part of parent, with its habit of blooming in clusters, and the peculiar spicy scent of its flower; and others again in which the hardy Ayrshire Rose has contributed strength and a wandering habit, but no flowers as yet.

But I must not omit to say a word upon the results of hybridising in a second generation. I have for the last two or three years hybridised some of the hybrid Sweet Briars with the polleu of the Hybrid Perpetuals. The result has been a number of plants, but hitherto no bloom; the age for their blooming has not arrived. Also as an experiment I sowed some of the seed of the hybrid Sweet Briars, obtained from their self-fertilised hips, and have many plants. Some of these plants have flowered, and the flower has gone back pretty nearly to the original Sweet Briar. Lord Penzance, in "The Rosarians' Year Book."

CUPRESSUS McNABIANA.

THE eastern side of Red Mountain, California, is covered with the most curious forest I have ever seen. A body of Cupressus McNabiana, about a half-mile square, and scarcely mixed with any other tree, covers it completely. The trees are only from 12 to 20 feet high, as a rule, but, like the miniature trees of the Japanese gardeners, they have all of the appearance of great age. Old and gnarled, tough and twisted, covered with moss, and with limbs broken, they look like the old forests of Cedar of Lebanon as they are pictured. A forest 100 feet high, looked at through the large end of a telescope, would give the same impression. A fire has swept through one side, and the old trunks, standing black and naked, aid the deception. Only the surrounding objects by which to aid the sight, keep one from being quite carried away by the deception. These trees, dwarfed so strangely by the arid soil and bleak climate, are very old.

The west face of the mountain is no less curious. Here the Cypress forms a dense thicket, from 6 or 8 feet high in the open hills, to 15 feet high in the gullies, and stretching over the whole mountain-side till it breaks into cliffs at the canon. Where the fires have burned over, the little seedlings are coming up, but in no such profusion as I saw in the thickets of Cupressus on the coast. Here, at the most, there would be one tree in 3 or 4 feet. The little seedlings having the soil to themselves, are of a fine green, and quite shapely, and many grow into handsome trees. A few seeds carried down the stream to gravelly flats in the valley have formed an open grove of specimens as handsome as any in a park of perfect pyramidal form and very broad at base. Handsomer trees are seldom seen.

Many of the lesser shrubs and flowers are quite as distinctive of Red Mountain as the Cypress. One Ceanothus in particular I have never observed except in such soils. It is much like a Holly in leaf, and forms a low bush. The flowers are white. The stream which flows down the east side has a broad bed heavily grown with a coarse grass, which retains the soil and furnishes a home for many flowering plants. For fully a half-mile Lilium pardalinum, in a large spotted form, grows in abundance and forms great clumps. As I have seen it in July, the stems 4 to 7 feet high, and the canon fairly filled with a wayy mass of the grand recurved red and gold blossoms, I thought it the finest floral sight I had ever scen. Our common Columbine, Aquilegia truucata, is a fine plant and the parent of some good garden plants; it flowers in May and June. In the grass and on the wet rocks of the numerous little falls, a form with viscid leaves grows in profusion, and, uulike the type, blooms constantly through the summer season. The flowers are more of an orange colour than the type. A variety of Stachys, with tomentose leaves and a pleasant fragrance, is almost as common, and in the wettest places one can see large beds of an Orchid much like a small purple and brown Lady's-slipper. This is Epipactis gigantea, a pretty species well worth cultivation. A large clump graces my Fern-bed, and rapidly increases, blooming freely every year.

Few Ferns grow here, but a Pellaca (P. densa) is abundant in the loose rock which has broken from the cliffs above, and in the rock crevices as well. It grows in large bunches, and the small dissected fronds are quite handsome when the winter rains wake them

of the most attractive is Dendromecon rigidum, a shrub from 2 to 8 feet high, slender, with light lance-shaped leaves and a blossom almost exactly like a light-coloured Cahfornian Poppy, except in size. This heantiful Tree Poppy in our region is confined to high altitudes. A well-developed bush is not soon to be forgotten. Morning Glories are everywhere in our State. A very common one with good-sized white flowers grows in grain fields, and is a trouble-some weed, pretty as it is. Red Mountain, in Morning Glories, as in everything else, is odd, and the creeping form which I saw in bloom one morning in May bad halberd-shaped leaves densely clothed with woolly hairs and a fine white flower. The stem crept about a foot. Carl Pardy, in "Garden and Forest."

111 feet across, with a total height of 70 feet. It is heated by eight rows of 4-inch pipes, and similar provision is made for heating the upper part of the dome. There is to be a marble fountain in the centre. The boiler-house is about 30 yards away, hidden from view by a shrubbery.

The furnishing of such a structure is a matter of great importance, and it is hoped that gentlemen who may have fine specimens of Palms, Cycads, Tree-Ferns, Sikkim Rhododendrons, Camellias, or other suitable plants which have become too large for their present position, may be inclined to supplement Mr. Yates Thompson's munificence by contributing towards the furnishing of the structure. An advertisement in another column gives further details as

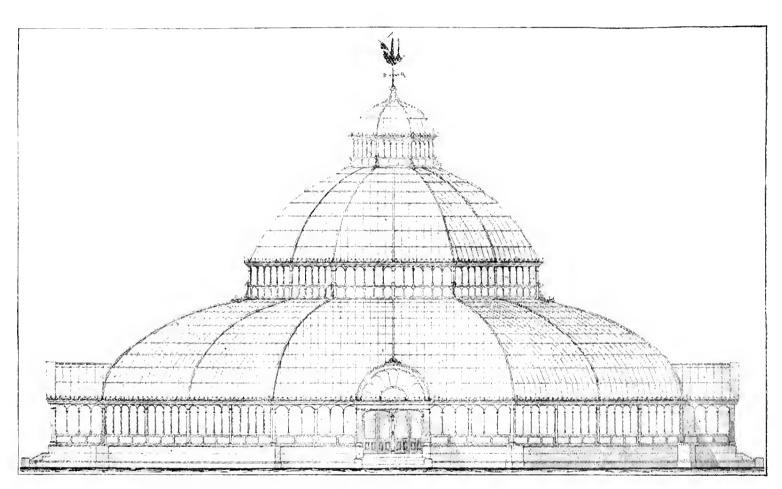

Fig. 12, +conservatory presented to septon park, liverpool, by Mr. H. Yates thompson.

from the long summer sleep; very delicate, too, the light green new growth resembling a Maiden-hair. Calycanthus occidentalis is not uncommon in the coast range, and is one of our finest waterside shrubs. It is rather prettier than the castern C. floridus, and, like it, the bark, leaf and fleshy chocolate-coloured flowers have a pleasant odour. It especially likes the clayey soil of this canon, and in some localities the growth is 10 to 12 feet high and completely fills the gulch. In clefts of the rock a rare Brodizea grows quite out of its range, for it is common 40 miles eastward. The flowers are white, and it prefers the courses of streams.

The higher slopes are also rich in rare plants. One

SEFTON PARK.

OUR public parks in this country are ill provided, if at all, with winter gardens, or places for shelter in inclement weather. Recognising this, Mr. Yates Thompson has munificently presented to the Lord Mayor and Corporation of Liverpool the fine conservatory of which we now publish an illustration and plan (figs. 12, 13). It has been erected in Scfton Park, Liverpool, by Messrs, Mackenzie & Moncur, of Edinburgh and Glasgow, and is intended for the use and enjoyment of the citizeus at all times, Sundays not excepted. The plants will be mostly planted out in beds and borders, with ample space for walking and for seats. The building is of iron and glass, about

to the mode of transmission of the plants. Sefton Park, we may remind our readers, was laid out by our eminent friend, M. André.

NOTES ON VEGETABLE PRODUCTS, TAKEN FROM CONSULAR REPORTS.

(Continued from p. 10.)

Hankow.—Vegetable tallow shows a slight improvement on 1894. This product meets with more attention on the Continent than in England. Its power of withstanding heat, which enables it to be shipped in "cheeses" without any packing, would seem to show that it was well suited for candles in hot climates,

but there has been very little readiness shown in London to deal in it. There are three or four qualities of the article, and its purity greatly depends upon the manner in which it has been

market were for many years almost entirely neglected, but in Europe it is much used for candles, as a component in the manufacture of soap, and for other purposes. Advices have been received from England

better undertaken previous to export. The beauty of the autumn tints of the Tallow-tree, especially when grown near water, recommend its introduction into the milder parts of England.

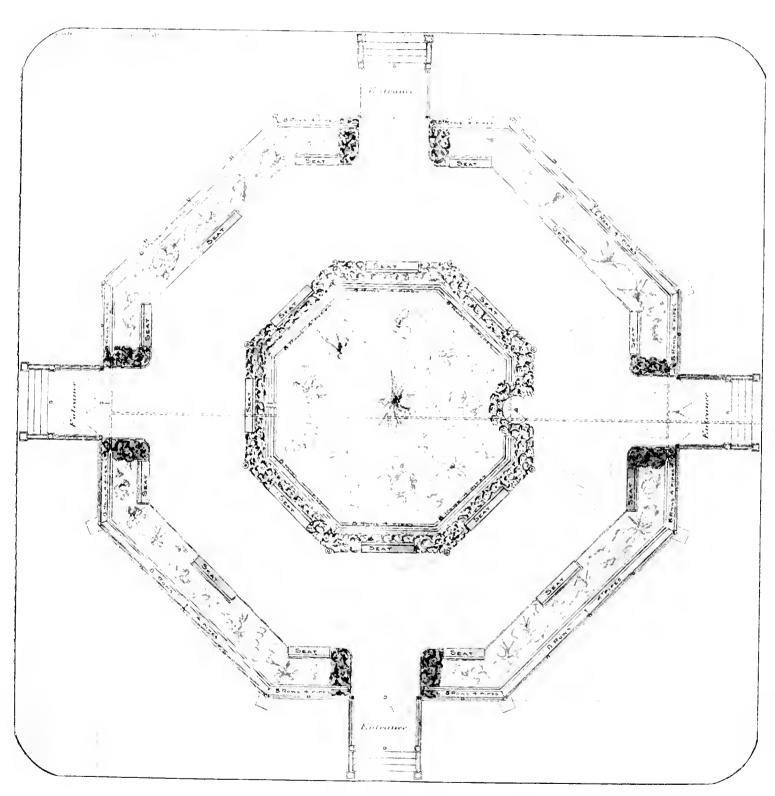

FIG. 13.—PLAN OF CONSERVATORY IN SEFTON PARK, LIVERPOOL. SEE P. 66.)

prepared for export. If crushed with the seeds, its quality is greatly deteriorated, and the cheeses contain elements which are difficult to remove. But if the coating is carefully removed from the seeds and then boiled, it is said to withstand any heat, and to be very serviceable. Samples in the London

to the effect that adverse duties on the Continent on export from Great Britain absolutely prohibit the trade thence. The stitement seems to admit of doubt. The production of this tallow is capable of very large extension. It appears probable that the earlier stages of manufacture of this article might be

Whether this last note refers to the tallow from Exceptaria sebifera, or from the Japanese Rhus succedanea, it is difficult to say; it would, ho vever, seem to allude to the former, except that the fat is usually very soft, and readily melts in hot weather, while that from the species of Rhus is hard and wax-like.

VEGETABLES.

SUTTON'S EARLY GIANT MARROWFAT PEA.

This is the quickest Pea in coming to maturity of any that I have grown. It is a good cropper, haulm 31 feet high, with long, handsome, well-filled pods, containing eight to ten seeds in each. The Peas are of excellent flavour, indeed, it is a true Marrowfat Pea, coming into use quicker than the small round-seeded varieties. Seed of this variety sown on March 17, at the same time as Laxton's Standard, Chelsonian, Sutton's Early Marrowfat, and Ne Plus Ultra, the dates when pods were ready for gathering were :- Sutton's Early Giant, June 15; Standard, June 23; Chelsonian, June 25; Sutton's Early Marrowfat, June 26; Ne Plus Ultra, June 27. Thus it will be seen that Early Giant was eight days earlier than Laxton's Standard, which is one of our best early Peas, very hardy, and an excellent cropper; but if Early Giant will survive the winter outside, it will be in advance of all other early varieties of Peas. II. H. Divers, Lelvoir Castle Gardens

THE WEEK'S WORK.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

HYDRANGEA PANICULATA is far more effective when planted in a mass than if dotted about the borders or shrubberies, the large white panicles of thowers being very showy, and they are, moreover, exceeding useful in a cut state for decorative purposes. As a late flowering shrub, this is one of the best, flowering as it does when but few others are in bloom; it thrives best in a cool moist position. [There should be a deep basin for holding water formed around each. Ed.]

GENERAL REMARKS.—The present season has been a very trying one for the occupants of the flowergarden, and many established plants, herbaceous perennials, have suffered, the foliage having become yellow —the Irises especially. Shrubby Phloxes should receive a thorough soaking of water whenever the soil gets dry, surface watering doing them more harm than good; afterwards affording a mulch of short deeayed manure or cocoa nut fibre. All plants in the beds should be well supplied with water, dead and decaying leaves and flowers removed, and constant attention given to the pegging-down of trailing plants where this method appears to be desirable, and to the removal of superfluous shoots. Most of the Roses are now past their best, especially on light and gravelly soils. These plants should be thoroughly well watered, both at the roots and overhead, which will not only cleanse the foliage but stimulate growth, and check the increase of red-spider, which is sure to infest them in such a season as the present. If these matters are attended to forthwith, a good supply of autuum bloom may be anticipated.

GLADIOLUS should receive similar treatment, and never allowed to become dry at the root, dryness being detrimental to the growth of good flower-spikes. Red-spider sometimes attacks the Gladiolus, the leaves and flowers suffering, so that it is very desirable to keep the plants in a vigorous condition, and plenty of moisture at the root, deep tilth and abundance of manure are necessary to ensure this.

THE BUDDING OF BRIARS.—The present month is the most suitable for the budding of Roseson Briar stocks, although it may be performed as late as the month of September. If the stocks are afforded water at the roots a few days before budding is begun, the bark will lift easily, consequent on there being a decided flow of sap in the plants. There are many losses this year among the stocks, and especially where the earthing up of the stems is not practised. is of much consequence in dwarf stock, which should be budded as low as possible, in fact, close to the roots, which may be easily accomplished by scraping away the earth. Rose-buds should be taken from shoots which are about three parts matured, and even in some cases the best buds will be found on plants growing in glasshouses, especially the more tender Teas. After a bud is inserted in the stronger shoots of a stock, or at the collar, and made secure, no further attention will be necessary for a period of about three weeks, by which time the buds which have taken may be identified by the falling away of the remains of the

leaf-stalk, and the fresh plump look of the bud itself. Stocks on which the buds have failed should be again budded, deing this on the opposite side of the stock, and at pruning time, not before, the snag above the bud may be cut off.

CARNATIONS.—In some places layering has commenced. The warmth of the season has favoured the growth and development of the border varieties, which, on the whole, are remarkably free from insect pests, and on heavy soils these are doing remarkably well. Layering in any case may now be preceded with, and if the directions afforded in a former calendar in regard to the preparation of the soil and the layering of the shoots have been attended to, the work will be facilitated. Layering at the best is considered a somewhat wearisome and trying job, especially when it has to be done under a hot sun. Layers made at this season soon emit roots, and form good plants before the winter. In September they may be severed from the motherplants, planted in beds, or potted and wintered in cold frames.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

STRAWBERRY BEDS.—When fresh beds of Strawberries are being planted, it is a common practice to plant the rooted runners at from 12 to 15 inches apart in the rows, with the intention of obtaining as much fruit as possible from the land in the first season. Such beds should have every alternate plaut in a row removed the first year of fruiting, as soon as the crop is gathered, thus affording space for those that are left to fully develop. All of the runners on these plants should be removed, and as often afterwards as they are preduced; this also holds good for plants which, having been forced, were afterwards planted out. Keep the beds clear of weeds by hoeing.

FIG TREES.—The young stocky, short-jointed wood of the current year should now be laid-in, leaving plenty of space in the fastenings used to admit of full growth without pinching the shoots. No more should be retained than space can be found for without crowding, and all other current season's shoots should be cut off.

APRICOTS.—The fruits will in most parts of the country have finished stoning, and a number of secondary growths will have pushed forth, all of which should be pinched back with the finger and thumb to one leaf. To prevent the young foliage harbouring insects, afford the roots a heavy appli-cation of water, and wash the trees with the gardenengine, doing the latter daily till the fruits commence to change in colour, when any further wetting must cease. Aut, woodlice, and sometimes mice, feed upon the ripening fruits of the Apricot, compelling the gardener to take means to preserve the fruit from injury. Woodlice can be caught by placing inverted small flower-pots filled with dry hay on the border, close to the Apricot trees, and once or twice a week, dropping the hay into a bucketful of scalding water. Ants are difficult to deal with, and the most effectual means that I know of is to pour boiling water with a small quantity of petroleum mixed in it into their nests late at night, which is, however, possible only where the nests are distant from the roots of fruit trees. They may be trapped by laying dead birds in their runs, which soon become covered with them, when the bodies may be gathered up and placed in boiling water. Mice should be trapped.

WALNUTS.—If any of these nuts are required for pickling, they should be gathered before the shell begins to harden. In gathering the nuts for this purpose the thick clusters should be thinned, which will aid the development of those which will remain.

PLANTS UNDER GLASS.

By JNO. McIntyre, Gurdener, Woodside, Darlington,

IXORAS.—Those now in flower may be moved into a cooler house, and if moderately shaded, the plants will last a long time in flower. The Exora is a plant that 1 do not think is benefited by manures of any kind, good fibrous peat and coarse silver-sand being all that is required to grow it well. Careful watering is very essential, or the plants will quickly become unhealthy. The present is a good time to increase the stock. Insert cuttings singly in thumbpots, using sifted peat and silver-sand. Put them in the propagating-box until rooted. As soon as this has taken place, shift them into 4-inch pots, and encourage growth as much as possible during the next three months. They will then make plants that

will carry four or five trusses of bloom in 6-inch pots next season, and such plants are exceedingly useful for vases in rooms.

CLERODENDRONS.—Specimens now in full bloom must be kept cool and in a tolerably dry atmosphere, for the purpose of prolonging their season of flowering. Water frequently with liquid from the farmyard, or add a sprinkling of Clay's mannre before watering them. Those which flowered earliest, if treated as recommended in former notes, will have flost all their foliage, and be ready for starting afresh to furnish plants for the late season.

ALLAMANDAS ought now to be showing abundance of bloom, and the season at which they are wanted must determine the treatment they should receive. If backward they will require to be pushed on. This would however be unfortunate, for if Allamandas are grown and flowered in a high temperature till they are required for exhibition, the plants may flag when staged. They should be kept cool a fortnight previous to removal to conservatory, or te the exhibition tent. The plants should now be afforded frequent applications of liquid-manure or other fertiliser. Complete all the necessary tying, so that the plants may have time to assume a natural appearance.

CALADIUMS grown in small pots may be fit for pots of a larger size, and they will then grow with increased vigour, and remain useful for a longer period. Use compost consisting of two parts yellow learn and one each of peat and leaf-mould, with a little sand. Add to this dried cow-manure, to the extent of one-third of the whole, and pass it through a half-inch sieve before using it. Afterwards apply water carefully for a few days.

ACALYPHAS may now have become leggy, and well-coloured tops should be taken and struck for use later in the autumn. Place them singly in 3-inch pots, using one part of leaf-soil, one of loam, and one of silver-sand. Put them into a case in the propagating-house, where they will soon make roots; then remove them to a shelf near the glass in a Melon-pit or other warm structure.

DRACÆNAS raised from eyes during the spring being now pot-bound, should be given a shift into 4 or 5-inch pots. Place near the glass, and afford them all the light possible.

MISCELLANEOUS.—At this season a careful inspection of the whole collection of plants should be made, and any plant that has become root-bound, and cannot be left over till the spring without injury, should be given a shift, care being taken not to give too much pot-roem, as it is getting late in the season, and most plants winter best if rather potbound. Pot on Cinerarias and herbaceous Calceolarias which may be ready; those sown last month should be pricked off into pans previous to placing them singly in pots. Use a compost for them consisting of good yellow loam and sharp river-sand. Schizanthus, sown last month to flower in the spring, should be pricked into thumb-pots, putting three seedlings in each pot. If the conservatory is required to be gay in March and April, these are splendid plants for the purpose, if well grown. They must not be afforded large shifts—smaller ones at short intervals suiting them much better. Give them a light compost, and during the next three months grow them in cold frames. Plants of Azalea mollis that have been in a Peach-house since flowering, may now be given a position in the open, well exposed to the sun. If the pots can be plunged in some cool material, it will assist the growth, and save much watering.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

SCHOMBURGKIAS.—These plants enjoy sunshine at all seasons. S. tibicinis, S. Sanderiana, S. Kimballiana, and S. Humboldti have hollow, horn-like pseudo-bulbs; they are now commencing to grow, and, if necessary, should be given fresh material to root in. Very little is requisite, as the plants grow more freely in a shallow than a deep compost. It may consist of fibrous peat and sphagmun-moss, in the proportion of two-thirds of the former to one-third of the latter. The drainage must be as perfect as possible, so that the compost maybe afforded frequent and copious waterings. They thrive equally well in pots or baskets, but, like Dendrobes or Mexican Laclias, it is essential that they receive abundance of light, air, and moisture. When growth is completed, afford less moisture, and place the plants where they will get the least amount of shade, but plenty of fresh air. Schomburgkia Lyonsii and S. undulata will grow well under similar conditions. The growth upon both species is now

well advanced, and should not be disturbed by repotting. S. crispa succeeds best under ordinary Cattleya-house treatment, if given a light position.

VANDA TERES is of exquisite beauty when in bloom, but many cultivators fail to flower it satisfactorily. Its particular requirements are plenty of direct sunshine and copions overhead waterings several times a day during active growth. a Mexican-house exists, this is the hest place for it, and if given plenty of fresh air during the day when the sun is shimng full upon the plants, and a thorough syringing at closing time, this species will thrive well and bloom profusely. The flowering period is past, and some of the plants may need overhauling. Some growers cut off the stems at about 2 feet from the top, and insert them thickly in beds of growing sphagnum-moss. The method is a very convenient one, especially where quantities of cut bloom are required from a small amount of space; but, as a rule, plants thus treated only produce three or four blooms on each spike, whereas plants cultivated in the following manner invariably give from six to nine flowers of good size and substance from each individual spike: -Half-a-dozen or more stems are fixed to long upright Teak rafts, each raft consisting of three or four reds, each rod being about three-quarters of an inch in diameter, and at least I inch apart to allow of a free circulation of air amongst the roots. The lower part of the raft is then inserted in a pot and made secure there with crocks, over which is placed a layer of fresh sphaguum-moss. At the present time our plants have overgrown the length of their Teak supports: therefore, about 2 fect of the stems of the plants and rafts will have to be carefully sawn off at the bottom, and the rafts lowered in the pots. Another new raft will then be screwed on to the top of the old one, to which the uppermost stems should be securely tied. the plants have been disturbed, they must be thinly shaded until the young roots have taken a firm hold of the new wood, when they may be gradually exposed to direct sunlight. The parts of the stems that have been cut off, if encouraged, will soon send out fresh growths, and in this way the plant may be propagated. Its allied species, V. Hookeriana, should be pagated in a similar manner, the proper time for the operation being about the beginning of September. Plants of this lovely species should be showing their flower-spikes. Place them at the end of the hottest house where they may receive uninterrupted sun-bight, and well syringe them overhead several times daily till the flower-buds expand. To successfully grow and flower this variety, the plant must, all the year round, be afforded warmer treatment than V. teres. V. Kimballiana and V. Amesiana do well in the same house as V. teres; they should be placed in such a position that air can circulate around them; and neither species should be syringed overhead, the water which lodges in the axils of the leaves frequently causing them to become spotted.

RENANTHERAS, ETC.—R. coccinea is another Orchid whose roots cling firmly to, and entwine themselves around Teak-wood rods. The plant delights in plenty of sunshine and a hot moust atmosphere during its season of growth. Identical treatment as regards light, heat, and moisture should be given to the rare and beautiful R. Storiei, to induce it to produce its panicle of richly-coloured flowers. R. matutina, now in bloom, should be grown with Aërides, Saccolabinms, &c.: so also should the singular Orchid Trichoglottis (Stauropsis) fasciata, and the pretty Stauropsis philippinensis.

RE-POTTING.—In the cool-house there are several plants that require to be re-potted or re-surfaced at once, the more important being Maxillaria Sanderiana, M. præstans, and M. Amesiana. As these varieties frequently thrust their flowers through the soil in a downward direction, basket-culture is the more suitable, and for the same reason no crocks should be used for drainage. Maxillaria grandiflora, M. venustum, M. Hubschii, and M. fucata, grow theroughly well in an ordinary flower-pot or shallow pan. All of these species root freely and make strong growths in a compost consisting of three parts sphagnum-moss to one of peat, intermixed with plenty of small clean crocks. Maxillaria Turneri may also be repotted now; this plant succeeds best in an intermediate temperature.

THE KITCHEN GARDEN.

By ${\tt C.}$ Herrin, Gardener, Dropmore, Maidenhead.

THE DROUGHT.—Owing to the continuation of intense heat, frequently accompanied by drying winds, watering plants will of necessity occupy a considerable portion of the time available in this department, in

order to keep Peas, Celery, &c., in a growing condition. The advantages of early mulching is now very apparent. On our rather light soil those Peas not early mulched and watered are virtually dried up, while others that could be well attended to in this respect, and have been watered twice weekly, are now podding fairly well, sufficient to supply a moderate picking daily. The variety Goldfinder, a Pea of the Ne Plus Ultra type, is one of the best now in use, and it appears to withstand the extreme heat better than the older variety. Keep the surface-soil well stirred by frequent hoeing. Early Runner Beans are flowering freely, and these, together with dwarf varieties, must be kept well supplied with water, or the crop will be a failure. Lettuces, Radishes, &c., also require frequent waterings to keep them growing.

CABBAGE. - A small quantity of an early variety of Cabbage seed may now be sown from which a first planting on a small scale may be made. So much depends on the weather in autumn and winter, that it is advisable where a considerable quantity of Cabbage is required, to make three sowings, early, mid-season, and late, allowing about a fortnight between each. the bulk of the plants or main crop to be planted from the middle sowing. If the first sowing be made about the 20th of the month, and the plants put out as soon as large enough, these will, providing the autumn be a favourable one, form heads for early use, and if not further required for Sprouts, the stumps may be cleared off, and the ground prepared for some other crop—Ellam's Early and Sutton's Flower of Spring form two capital varieties for early cutting. The seed-bed should be in an open quarter of the garden, and be well prepared and thoroughly watered a few hours before the seeds are sown. These may be scattered broadcast, or sown in shallow drills 8 inches apart. Should the extreme heat continue, it will be well to cover the seed bed with garden-mats until germination takes place, after which it should be covered with netting, otherwise the birds will be found troublesome.

MAIN-CROP ENDIVE.—The present is a suitable time to make a full sowing. Borders on which early Cauliflowers have been growing may be lightly forked over, breaking up the clods finely, and working in, if the border is in poor condition, a little short, well-rotted manure. After the drills are taken out about I inch deep and 12 to 15 inches apart, they should be well watered and left for an hour before the seeds are sown. Sow thinly, and after covering in, beat with the back of a rake to make the soil firm. The most reliable varieties are the Selected Green-curled, and the improved round-leaved Batavian.

LEEKS.—Those sown for the main crop will now be large enough for transplanting into drills, 5 or 6 inches in depth, and 15 inches apart. The ground for these should be well manured. Those planted out earlier from boxes will require—as will also the newly-transplanted ones—copious snpplies of water. The early plants that are growing freely, will require a little soil to be worked up around the stems, and this should be done after a thorough watering with weak liquid-manure has been afforded them.

LATE FRENCH BEANS.—These are generally very useful at the end of the season, and if a number of short rows of Ne l'lus Ultra can be sown on a border under a wall, protection from early frosts may be easily afforded by means of mats or canvas.

FRUITS UNDER GLASS.

y W. Pope, Gardener, Highelere Castle, Newbury.

GRAPE VINES .- The Vines that are now swellingoff their berries should not be neglected in the matter of an abundant water supply at the roots, especial care being needed during a summer like the present one. Museat varieties can scarcely be afforded too much water, provided the drainage of the border is in good condition, from the time the flowers appear until the fruit is well advanced towards ripeness. When the fruit of any variety commences to colour, a good mulch of short, dry material should be applied to the inside border after a thorough application of water, so as to check evaporation. The atmospheric moisture should be reduced, and a free discrete for the control of the control o free circulation of air afforded, allowing a little heat in the hot-water pipes in cool weather rather than allow the night temperature to fall below 70°. The laterals on all Vines carrying a crop of fruit should still be rubbed off by hand as soon as perceived. See that the leaves of Vines that have been cleared of fruit are maintained in a healthy state. Should the early Vines be exhausted, and the replanting of the house contemplated, a fresh border should be prepared forthwith, and canes planted, which should have been

raised from eyes struck in the spring, there being yet plenty of time to get them well-established before the season of growth expires. As the soil of which the new border will be made is likely to be deficient in moisture, care must be taken to make it thoroughly firm by treading and ramming it before the planting of the young canes is begun. When planting the Vines the roots should be carefully disentingled, and spread out to their fullest extent, covering them with the finer particles of soil, or with a speciallyprepared soil, and finishing with a good watering with tepid water, and a mulch of half-rotten manure. Keep the Vines close in a warm temperature, and shade them for a few days, afterwards gradually inuring them to sunlight and air. It is sometimes a prudent course to lift the roots of old Vines that are doing unsatisfactory, laying the roots in fresh soil, or entirely re-making the border. In any case, the soil or compost required should be prepared, so that there may be no delay when the opportunity offers for carrying out the work. When the borders are both inside and outside, these operations may be carried out with no risk of losing a crop, or of any perceptible check being given to the Vines by spreading the work over two seasons, one year taking the inside border, and the next the outside one. It must be done, however, in the late summer, or early in the autumn, whilst the Vines earry foliage, so that the roots will enter the new soil the same year. A good sprinkling of some approved kind of Vine-manurmry be mixed with the compost. It is very important that the work be done quickly and carefully, not letting the roots be exposed to wind and sun, but frequently damping them whilst out of the soil, and shading them and the vines. Should the borders require to be renewed, the drainage should be first put in good order.

THE APIARY.

Bu Expert.

VENTILATION.—While this very hot weather lasts, be careful to give the bees plenty of ventilation, by raising the hives with two little wedges of wood placed on each side, thus allowing the air to pass between the floorboard and the combs, and keep them working in the sections or shallow frames; this is all the more necessary, as the honey season is nearly finished, except in the "Heather districts." It is now useless to put on more crates of sections, but it is better to allow the bees to finish filling and scaling those that are already on. In cases where the bees are strong, and have filled their crates, remove some of the partly-filled ones from other hives where they are not so strong, and place them on the stronger lot, as by thus doing all the bees will be kept at work, and get the sections filled as well; and in most cases it will be found that where stock have thrown off swarms, and have not been returned, the sections will, as a rule, be left partly filled, and these are a trouble, because they have to be extracted, not being saleable as they are.

EXTRACTING .- This operation should be performed with great care, so as to keep the honey as far away from the hives as possible; an empty room if convenient is the best place to extract in taking care that all the windows and doors are closed, to prevent the bees being attracted, as besides the great inconvenience they cause to the operator, it also starts them robbing from cause to the operator, it also state them too have weaker stocks, which, when once commenced, is very difficult to put a stop to. When new honey is required for show it is well to extract it three weeks or a month beforehand, so as to allow time for the honey to clear itself, and the bits of comb, &c., which rise to the top of the bottle to be skimmed off. Put the honey by in a cool dry place till required. It is a common and harmful practice to take away more frames containing honey from the body box of the hives than the bees can spare, which compels the bee-master to feed with syrup in the autumn, when this might be avoided by taking less away. From six to eight frames should be left in any case, and be careful not to extract from any frame containing brood. After extracting, the frames or sections can be returned to the hive for bees to clear out, and then put by for use next year. Sections for show or sale, as they are taken from sections for show or safe, as they are taken from the hive, should be kept the same way up, carefully cleaned, and the propolis scraped off, which can be done with an old knife; and of course the sections show to much better advantage by being glazed and stuck round with a narrow edging of fancy paper. which can be bought very cheaply from any of the bee appliance dealers; three-eighths of an inch is about the margin allowed.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -63°.4.

THE great gathering of the clans Metropolitan has taken place, and, as usual, when the National sounds the Rose Show. trumpet, there was a goodly muster from all parts of the kingdom; contingents came from as far north as "bonnie Dundee," and from as far south as the Isle of Wight, from the Queen of the west, and from the metropolis of Rosegrowing in the east; in fact, from almost every county representatives came. They had not the exultant air of expectant conquerors as in former years—there was a sort of depression about them. Faces were not so "wreathed in smiles" as they are accustomed to be, and one instinctively felt that there was something wrong; and when the lids were removed from the boxes and the flowers lay open to inspection, it was at once seen what was the cause of all these downcast looks. As Mr. Mawley has already told our readers, there were fewer Roses than have been shown for years, and the quality of them was certainly very mediocre. One instance will sufficiently exemplify this, Imagine two of our best judges of Roses who on that account had been selected to choose out the best Rose in the show, coming up with a somewhat indignant air and asking, "Are we obliged to give the medal for the best Rose? Here is the best that we can find; we think it would be a discredit to the National to give it a medal." What could be said but that, "If the best Rose were an indifferent one, it must still have it." "Well, we do not like doing it, but I suppose you are right." In truth, the Roses were both deficient in size and substance; there were, of course, some good ones, and some boxes over which one lingered with pleasure, but these were the exceptions, and though to the general public the flowers seemed worthy of the honours that they obtained, many a victor was fain to confess that he had won with flowers which in some seasons he would not have cared to put up.

Great was the consternation of the committee, when a couple of months ago the intelligence was brought that resarians could not have their usual place, but would be obliged to be squeezed into the space in front of the great orchestra; the nave, where the show was usually held, being occupied by the carriage exhibition. Great efforts were made to try and alter this. but, after all, we are not sure but that the arrangement was more pleasing to exhibitors; the flowers were more together, and it was more easy to see them. As we have already given a full report of the flowers exhibited, a few points only need be now mentioned.

It has been seen that the Challenge Trophies went into different hands: Colchester had to give way to Bedale, or perhaps it should be said. Bedale and Hitchin combined; while the Amateur Trophy, which has during the last six years, with one exception, been taken by Mr. E. B. LINDSELL of Hitchin, was captured by one who formerly held it, the Rev. J. II. Pemberton, of Havering. The season was. no doubt, favourable to him, as he generally considers the Crystal Palace too early for him, so the forwardness of the present season was in his favour. The "Tea" Trophy also went to East Angha, as did the Harkness Cup, which is now retained permanently by Mr. ORPEN. With regard to the extent of the competition, it is a somewhat curious fact, that although fewer Roses were staged, yet very nearly all the prizes offered were taken. In some years there is a considerable saving to the Treasurer from this cause, but this year very little; it evidently shows one thing, that the arrangement of classes according to the number of plants grown by the exhibitors has worked well. The prizes offered for the Roses raised by Messrs. ALEXANDER Dickson & Sox brought forward an interesting competition in both the nurserymen's and amateurs' divisions, and showed what good Roses had come from that source; and there was one in Mr. LINDSELL's box which has not received the attention which it merits. We allude to that beautiful Tea, Muriel Grahame. The nurserymen's stand was not at all equal to the amateurs' (by-the-by, it is necessary to correct an error in our last issue, in which this prize is said to have been offered by the firm, whereas it was really offered by Mr. C. J. GRAHAME; and although he did not wish his name to be known. it is now so open a secret, that he should have the full credit of his liberality). Probably the best Rose that has been sent out by them is Mrs. Sharman Crawford, though run hard in such a season as this by Margaret Dickson. which has everywhere been very fine. The same gentleman offered a prize for Roses raised in England and Scotland; this was won by Messrs. ALEX. DICKSON & SON, whose stand contained some fine blooms. Some of the most interesting stands were those of 12 of one variety. Mr. Mount's glorious stand of Mrs. John Laing confirmed the view many of us have had, that this is the best Rose that Mr. HENRY BENNETT raised. There was also another box of Captain Hayward, which Mr. Mount exhibited so well at the Drill Hall earlier in the season, showing it to be a grand Rose for pot-culture, and now established as a good exhibition variety. Then there was a very beautiful box of that somewhat little-known Rose, which last year gained the Medal for the best hybrid at Derby-Comtesse de Ludre, and which as shown by Messrs. MACK & Son at the metropolitan show was a decidedly effective Rose. In the same way, the stand with Marchioness of Londonderry, which gained the 1st prize for the best twelve blooms of white Rose, contained many very beautiful flowers, although some do not like the tint of white (if we may use such an expression). The twelve blooms of The Bride which came next to it were very pretty, although defective in point of size. The stands for new Roses were mainly comprised of homeraised flowers. The French Rose which was most frequently shown and the most generally admired was Maman Cochet, and we may hope from its vigour it may prove a useful Rose; but we may be disappointed, as some have been with Ernest Metz; we had hoped great things from it, but it has not been the gain we anticipated. Dickson's new Rose, Helen Keller, promises to be another useful addition to the pink Roses we already have; however, if we could get some more of the highlycoloured Roses, such as the Earl of Dufferin, we should be glad of them, alike for exhibition and for our gardens. No medal was awarded for any new Rose, although several candidates for it were exhibited; one of these, Mrs. Frank Cant, a light blush form, which was commended, has already received an Award of Merit from the Royal Horticultural Society. Before passing from these exhibition Roses, a word may be said for the very beautiful paintings of some half-a-dozen Roses, exhibited by the artist, Mr. HAYWARD, of Twyford, near Winchester; they are unquestionably among the best paintings of Roses ever seen; so much did the judges and committee think of them that they awarded the artist a silver medal.

The class for hybrid Teas was better filled than has hitherto been the case, but this has been done by robbing the hybrid perpetuals of such flowers as La France, and the Teas of Kaiserin Augusta Victoria; while Lady Mary Fitzwilliam and Viscountess Folkestone have also been pressed into the service, although for many years they have been exhibited as H. P.'s.

Probably, no part of the exhibition was the subject of keener interest than that allotted to garden Roses and displays of decorative Roses, especially the former. Of these, the exhibits of Mr. H. V. MACHIN, who gained Lord PEN-ZANCE's handsome Cup for garden Roses; and those of Messrs. PAUL & Son, of Cheshunt, and Messrs. Cooling & Son, of Bath, were very fine, while their artistic arrangement left nothing to be desired. There were, it is true, but few of the single Roses amongst them, as they had mostly passed their prine. Mr. MACHIN's stand, which was admirably arranged, contained fine bunches of Red Damask, The Pet, Madame Worth, Perle d'Or, Bardon Job, Anna Maria de Montrayel, Mignonette, Red Pet. Macrantha, Gloire des Polyantha, Madame P. Ducher, China, Baron de Chassaneur, Maiden's Blush, Thoresbyana, Cecil Brunner, and Rosa Mundi. Messrs. PAUL & Sons' stand comprised, amongst others, Madame Chedane Guinoisseau, Gustave Regis, Madame Pierre Cochet, Madame Pernet Ducher, L'Idéale, Ma Capucine, Homère, Safrano, Bardon Job,

and Crimson Rambler. It will thus be seen the smaller Tea and Noisette Roses, and the little gems of the Polyantha class, came largely into requisition.

It will be seen from the list of awards which were given in a previous issue, that many new grewers have come forward; names which have not hitherto been seen in the list of combatants. This is the result of one of the sub-division of classes according to the plan proposed by Mr.

perhaps, not meet again; while each year shows the losses we have sustained, and we miss many a kindly greeting. The arrangements at the Palace are always as good as long experience and a desire to please can make them; and the thanks of Rose-growers are due to Mr. Head and his assistants for the manner in which difficulties are overcome and the wants of exhibitors provided for. We have had a pleasant meeting, and although in a Rose point of view, not up to the mark, we

be estimated by a glance at the accompanying illustration (fig. 14), which shows the freedom with which the species flowers. It is a deciduous shrub, the leaves being lanceolate, pointed, and from 1½ to 3 inches long; they are of a lustrous green, with a few hairs on the upper surface near the margin, the margin also being irregularly ciliate. The flowers, which appear in April before any of the leaf-buds have burst, are of a clear pale pink, becoming almost pure white before they fade; they are 1½ inch across, the petals being oblong, with rounded or emarginate tips, and there are a few spots of reddish brown or

Fig. 14.—RHOZODENDRON VASEYI: COLOUR PALE FINK, CHANGING TO WHITE.

GRAHAME; ether growers have moved upwards, such as Mr. GRAHAME in his new garden at Leatherhead, and Mr. W. Boyes of Derby; there is still, however, a lack of exhibitors from the North. In the ease of amateurs, we do not get much from beyond the Midlands; but perha's at Ulverston the northern exhibitors may make their appearance. Since the retirement of Mr. Whitwell and Mr. S. B. Hall, no one has arisen to fill the blank.

Rosarians, as a rule, make a point if they can of coming to the metropolitan show, and thus one meets with old friends who we may,

can have the satisfaction of laying blame on something which has in this country to bear a good deal—the weather.

RHODODENDRON VASEYI.—Among hardy shrabs introduced in recent years from North America, there are few of greater promise than this. It is perfectly hardy, even in the seedling state, and flowers when only a few inches high. Although introduced to Kew only eight or nine years ago, it has borne seed for several years past. In its native home, on the hills of North Carolina, it reaches a height of 15 feet; and the wonderful beauty of these bushes, as described by those who have seen them in flower, may

the three upper ones. Among the seedlings raised at Kew are one or two with flowers that are almost pure white on first opening. Rhododendron Vaseyi and R. rhombieum bloom at the same time; and although the flowers of the one now figured are smaller, the species are evidently closely allied. R. Vaseyi seems, indeed, to be the American representative of the section to which R. rhombicum and one or two other Japanese species belong, and differs much in general character from the other decidnous Rhododendrons of North America, from which, in conjunction with R. flavum (Azalea pontica), have been obtained the so called Ghent Azaleas that flower a month later.

Examination in Horticulture.—Examiners' Report.—"To the President and Council of the Royal Horticultural Society. Gentlemen, -We beg leave to report that we have examined the papers submitted to us-in all 152. Of these we selected 16 as worthy to be placed in the first class, 53 in the second, and 40 in the third. The remainder were passed over. The candidates were distributed over the whole of Great Britain, but no papers were received from Ireland. The Examination, as a whole, shows, in our opinion, that a more intelligent appreciation of the principles underlying practical horticulture is prevalent than was the case in previous years; nevertheless, there is abundant evidence to show that if the hands are trained to work, the eyes are not correspondingly taught how and what to see. Correct observation of the most common objects is still rare except among those who have had the advantage of adequate training. We have the honour to be. Gentlemen, your obedient servants,

June 20, 1896.

MAXWELL T. MASTERS, JAS. DOUGLAS.

 $\begin{array}{c} \textbf{QUESTIONs.} \\ Eight questions only to be answered, four from Devision A, and \\ four from Devision B \end{array}$

DIVISION A .- ELEMENTARY PRINCIPLES

1.-What are the objects sought to be obtained by digging the soil? Of what use is it to the crops?

2. What do plants do when exposed to bright sun-hine, and what takes place when they are subjected to total

darkness.

3.—Of the elements and compounds that go to make up the constitution of plants, a few occur in much larger proportion than others. Which are they, and whence are they starting the dark that go.

4.-What are the "reserve materials" of plants? Where are they stored? What use is made of them?

5.—What are the essential points in the structure of roots, as contrasted with that of stems?

6.-What are the special effects produced by nitrogenous

manures and by mineral manures respectively?

7. - Describe the shoot of a Peach tree and the arrangement

of its buds. -What part of the plant furnishes the vegetable known

as Asparagus?

9. -What are the main differences between the "seed" of a fungus? ϵ flowering plant and the "spore" of a fungus !

DIVISION B .- HORTICULITRAL PRACTICE.

1.-Describe the preparation of the ground for the Onion Top; the method of sowing the seed and subsequent treatalso the most suitable soil.

 $2.-\mbox{Wbat}$ are the circumstances which should regulate the trequency of watering and the amount of water to be given to plants in pots !

Describe the most suitable soil, and the methol of culture, for such tip-rooted vegetables is the Carrot and

-say what you know about the origin of the Cherry and

Apricot: the soil and manure most suitable to each; the discuses they are subject to, and the most effective remedies.

5.—Give the names of the best varieties of Strawberries

What is the most suitable soil for their culture? the culture (in detail) for forcing and the open garden.

6.—What is the origin of the Carnation and the garden

Pink? How may a supply of flowers be obtained from these plants all the year round? Describe the diseases and the methods of prevention and cure.

7.—Describe the culture of the Daffodil; its propagation; the diseases and other enemies that attack the plants, and the best treatment

-Describe the general details of Orchard House Culture; and state whether there are any advantages in growing fruit-

9.-- What are the best methods for ventilating hot-houses, and for shading the plants? Give general details

THE BOTANICAL GARDEN, ST. LOUIS .- With regard to the Botanical Garden at St. Louis, a view in which formed our supplementary illustration last week, we afford our readers the following note, descriptive of the effects of the recent cyclore, extracted from a late issue of transler and Forest:-It will be of much interest to the scientific and gardening world to learn the extent of the damage done to the Missouri Botanical Garden by the destructive tornado that recently visited St. Louis. The garden was in the direct path of the wrecking wind at its extreme western point. As this was the starting point of the destruction, the garden suffered less severely than the region just to the east, though the damage was considerable, more especially in the timbered portion. Something like 160 trees were either uprooted or broken off so near the ground that it was found necessary to take them out. Many of these were rare and choice plants, and an estimate of their value would be impossible. More than 250 trees were seriously damaged, many of them having their tops almost entirely carried away. Some of these, by judicious pruning, will, in a few years, grow to be beautiful trees again, while it is probable that a few will die. The shrubbery was badly whipped, but the damage to it was comparatively slight. The herbaceous plants were almost totally destroyed in the exposed places, but these are now all replaced by reserved stock. The grounds are rapidly being put in order, and in a month it is expected that all vestige of the storm will have been cleared away, and only the vacant places left to indicate its awful work. It is fair to say that the damage is not so great as to mar the beauty of the garden, nor to impair its usefulness as a place of instruction. In these particulars it will not suffer in the least. The injury to the buildings was mainly in broken windows and damaged roofs. The glass portion of the roof of one large greenhouse was entirely demolished, and the roof of the sonthern half of the herbarium and library building was carried away. By prompt action of the employés in the library building, its contents received no damage whatever.

CARDIFF HORTICULTURAL SOCIETY .- This Society made a wise arrangement when they decided to hold their annual show in the Cardiff Exhibitiongrounds. The dates are August 12 and 13, and there is every prospect of a good show being held. The tents will be fixed in the long avenue-a splendid site—but the space will be rather limited. Exhibits not for competition will only be allowed to those who make early application.

SCOTTISH HORTICULTURAL ASSOCIATION .-The usual monthly meeting of this Society was held at 5, St. Andrew Square on Thursday evening, the 2nd inst., Mr. R. W. E. MURRAY, the President, occupying the chair. The paper given by Mr. D. McIntere, Royal Botanic Garden, Edinburgh, was entitled "Fungi," and treated of several of the most injurious as well as beneficial, including cauker (Nectria ditissima, gummiug (Coryneum Beyerinckii), Apple-scab (Cladosporium dendriticum, Mildew, and Potato disease : Rhizobium leguminosarum, and Michoriza. The paper concisely pointed out the mod of germination, and stages passed through in the lift of these fungi, and the best method of prevention. A few of the best solutions employed in checking their spread was discussed by the members. After a hearty vote of thanks to the reader of the instructive paper the meeting closed.

FIRST-CLASS BULBS. - Subjoined are further results of the plebiscite initiated by the Dutch Bulb Society, and referred to on p. 790 in our last volume:--

Narcissus (single), Magni-coronati Group.-N. bicolor, John Horsfield, 396 votes; Golden Spur, major, maximus, moschatus, albicans, lorifolius Emperor, and bicolor Empress, 256 votes.

Medio-coronate Group.—Incomparabilis, Sir Watkin, 217 votes; Campernelli, 88 votes.

Parvi - coronati Group, - Poeticus ornatus, 315 votes; and the common poeticus, follows with 71 votes

Narcissus (double). - Orange Phænix, 369 votes; Van Sion, 366; and Silver Phænix, 357 votes.

Narcissus polyanthus. - Grand Monarque, 359 votes : Gloriosa, Grand Soleil d'Or, Bathurst, Her Majesty, Mont Cenis, The Pearl, Queen Victoria (yellow), and Don Carlos, 233 votes.

Crocus. - Mont Blanc, 351 votes; purpureus grandiflorus, Margot, Xerxes, Caroline Chisholm, and Albion, 200 votes.

Gladiolus.—Colvillei (red), 362 votes; Colvillei albus var. The Bride, and Colvillei albus, 289 votes.

Lilium. — Speciosum rubrum, 349 votes; speeiosum album, speciosum punctatum, speciosum album var. Kroonprinces, and speciosum album var. Kraetzeri, 263 votes. The beautiful Lilium Brownii gets only 68 votes, and the splendid Lilium auratum only 28 votes.

Scilla.—Sibirica, 301 votes.

Galanthus.-Nivalis and nivalis flore-pleno, both 287 votes.

Chionodoxa.-Lucilliae, 269; and sardensis, 208

Muscari.-Botryoides and botryoides album, both 247 votes.

Iris.-I. hispanica Blanche superba, 242 votes; I. Ovidius, 202 votes; I. Golden Cup, 194 votes; 1. Le Reconnaissance, 176 votes.

Fritillaria. F. imperialis maximus (yellow), with 236 votes; F. i. goudbont, 208 votes; F. i. maximus (red), 207 votes; F. i. snlphnrens, 196 votes.

Leucojum.-L. æstivum, 205 votes.

Representations of the above-named bulbs will be published from time to time in colonred plates in the Florilenium Harlemense.

SPECIFIC CHARACTERS .- At the last meeting of the Linnean Society, Dr. A. R. Wallace, F.R.S., read a paper "On the Value of Specific Characters." The object of this paper was to show that, accepting the facts of variation and heredity and the agency of natural selection, the characters which distinguish a species from its allies, and which are, therefore, either singly or in their combination, peculiar to the species, are necessarily useful. The causes said to be capable of producing useless specific characters were considered, and it was shown that such of them as did not involve the action of natural selection could not, except through a rare chance, extend the original useless variation to every individual of a species, and to those only. Useless characters, therefore, although often occurring sporadically, can never (except by chance) become truly specific. Some of the cases of alleged useless specific characters were then examined, and were shown to be explicable either as individual modifications due to environment, or as being adaptive and therefore useful, The conclusion arrived at was that, whether we can discover their use or no, there is an overwhelming prohability in favour of the statement that every truly specific character is or has been useful, or if not itself useful, is strictly correlated with such a character.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE." -The French edition of "Nicholson," published by OCTAVE DOIN, of Paris, has now reached the letter Phys. There are many additions to the letter-press and to the illustrations in this new edition.

NEW YORK. - Professor N. L. Baitton, of Columbia College, has been appointed Director of the new hotanical garden to be established in Bronx Park, in this city.

THE READING AND DISTRICT GARDENERS'
MUTUAL IMPROVEMENT ASSOCIATION had its
annual outing on the 2nd inst., when over 110 members took part in the event. The places selected to
be visited were Englefield (the seat of R. Benyon,
Esq.), Coombe Lodge, Whitchurch, and Shooter's
Hill.

THE GROWTH OF LEAVES.—At the last meeting of the Linnean Society, a paper was read by Prof. MACDOUGAL, "On the Relations of the Growth of Leaves to the Chlorophyll-function." The author remarked that the leaves of seedlings accomplish a large proportion, though not always their entire development, at the expense of the food derived from the seed. Rapidly developing but small leaves fur-

packets, and as in this form it is almost as beautiful and far more lasting than when freshly cut, it is a valuable acquirement. "Hunter's Preserved Ferns" should not be exposed to full sunlight, but, in a dry atmosphere, where in vases it will keep fresh, retaining its (apparently) natural colour and gracefulness for a long period.

CHESTER HORTICULTURAL SHOW AND FETE, August 5 and 6, 1896.—At the request of several intending exhibitors, entries will be received up to Wednesday, July 29, writes Mr. J. WYNNE FFOULKES, Hon. Sec., Crypt Chambers, Eastgate Row, Chester.

"FRUIT-GROWING," BY MR. W. WELLS.—This is the latest of the series of Manuals on Fruit-culture

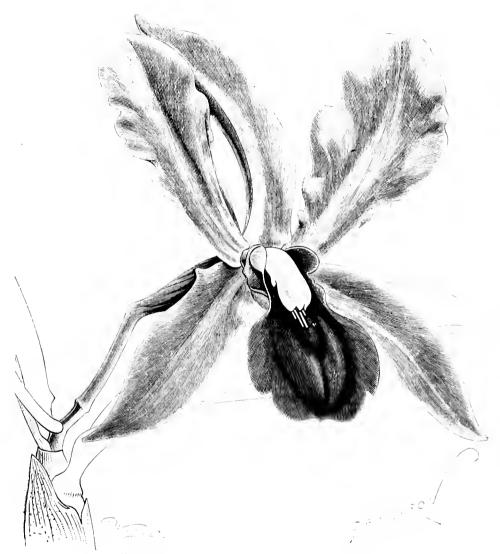

Fig. 15.—cattleya schröderiana; colour rosy-lieae.

nished with large stores of reserve food are able to carry out a complete development, but are unable to endure continued existence in an atmosphere free from CO_2 ; the slowly-developing leaves of many woody perennials develop normally and endure a long-continued existence under the above circumstances. This varying reaction of leaves is dependent upon a series of conditions which may be included in the phrase "availability of the food-supply." The death of a leaf in an air free from earbonic acid gas is due to insufficient nutrition.

PRESERVED MAIDENHAIR FERN.—Maidenhair Fern is well known as forming a most valuable addition to arrangements of eut flowers, but hitherto it has only been the favoured tew who were able to obtain a sufficient supply of it at all seasons. It can now, however, be obtained dried and coloured in

written by nurserymen in recent years, of which Mr GEORGE BUNYARD'S Fruit-farming for Profit was the first in point of time. Primarily written to afford a fillip to fruit-culture, these works have doubtless done much to make the possibilities of fruit culture in these islands generally known; and a good deal of the development of this industry is doubtless traceable to them. The contents of the manual, although differently arranged, do not materially differ from others of the above mentioned series. The chapters giving the reasons for an increase in fruit-farming and cidermaking are eogent and unanswerable; and that on packing fruit for transit by railway, &c., affords useful directions. We may remark that the author is a nurseryman, residing at Crawley, therefore a near neighbour of the author of a similar manual. Mr. Joseph Cheal, of the Lowfield Nurseries.

CATTLEYA SCHRÖDERIANA.

This pretty species (fig. 15), with flowers of rosy-lilac colour, somewhat resembling those of C. dolosa, was shown by Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, on the occasion of the meeting of the Royal Horticultural Society on Tuesday, June 23. The stems are about 4 inches in height, having two distinct joints, and the pseudo-bulbs have two leaves, which are oblong-ligulate. It is a desirable summer-flowering plant.

HOME CORRESPONDENCE.

A COMBINATION OF ROSES AND BRIARS.—The handsomest of hedges or clothed fences may be formed of Turner's Crimson Rambler Rose and Sweet Briar planted alternately. The absence of odour in the Rose is compensated by the delightful fragrance of the Briar. Anyway, the two varieties of Rose make a charming combination. K.

DOUBLE SWEET PEA.—We send herewith some blossoms of a Sweet Pea, which you will admit are a good step towards a double flower. You will observe that the standards are produced in duplicate and sometimes triplicate, and this feature makes the blossom far more attractive than has bitherto been the case when only one has appeared. James Carter at the

HOLLYHOCK DISEASE. - Although it may seem presumptuous to differ from Mr. Douglas when he writes about certain plants. I feel constrained to differ from him with all respect when, for instance. he states that Hollyhocks have not suffered materially from the well-known Puccinia this season. I have seen it in many places amongst not only double but single-flowered forms, the latter being now chiefly grown in rural districts, literally rampant, eating up leaves and stems wholesale. Then it is not my experience that a moist season favours the development of this fungus. So far from that being the case, I always found moisture at the roots and on the leafage as most helpful to robust growth, and strong growth enables the plants the more effectually to resist the attacks of this insidious and too commonly terribly destructive disease. Moist seasons may be harmful to the bloom, and especially so to fertilisation, but the roots and leaves undoubtedly like it. Those who would still, under the discouraging conditions by which surrounded, grow Hollyhocks (and when well grown they rank amongst the noblest denizens of our flower gardens), should have the ground for them well trenched, burying a good dressing of manure : give the plants plenty of room, water liberally in dry weather, and always raise from seed, which should be sown in fresh soil every year, if ruised outdoors. The moment the bloom is over, the stems should be cut off close to the ground, removed, and burnt, and a very light sprinkling of gas-lime and soil be given about over the roots, and be heed in. Seed for own sowing or sale should never be saved from infected stocks, and there can be no doubt but that even seed, microscopically examined, would be found carrying fungus-spores. D. [See Gard, Chron., July 15, 1882. p. \$7.—Ed.]

MEALY-BUG ON VINES AND XL ALL VAPORISER.—Last season I used this preparation ma late vinery containing amongst other varieties Lady Downes and Gros Colmar. I did not find the slightest trace of injury, although used twice in close succession. I have also this season used the preparation in a Black Humburgh vinery with equally satisfactory results: destroying thrip, the foliage being at that time in a very tender stare, the Grapes just thinned, in fact, I have many times tried to funigate with tobaccopaper, but never yet without some injury being done to Gros Colmar, this being in my experience the tenderest foliaged Vine in cultivation. XL All is undoubtedly the most valuable aid to gordeners discovered in recent years. Can any reader say, is it satisfactory as against spider in early stages? R. Grindreal, Trum Inn, R.S.O. Hereford.

EARLY PEARS.—Whilst the fruits of the Cherry, Peach, and Nectarine, Raspberry, Gooseberry, and Strawberry are in season, that is, during the months of July and August, many persons do not seem to need anything further as thirst-quenchers, and this fact may account for the general scarcity of early varieties of the Pear in most gardens. One hesitates to apportion any of our valuable wall-space to them:

and, indeed, it is not necessary in the warmer parts of the country. In summers like the present, the need for juicy fruits of all kinds in preference to intoxicating wines, beer, cider, mineral waters, acidulous decections in variety, which are apt to disagree with most persons if partaken in large quantities, should lead to the planting of a few trees of early Pears as espaliers and pyramids or half-standards in every kitchen garden. For July the following may be taken: Summer Francreal, syn. Doyeund d'Eté, Summer Doyenné, and Petit Moscat. For August, Jargonelle, Citron des Carmes, Bloodgood, Windsor or Green Windsor, Beurré de Juans, B. Précoce, Summer Rose, Peuch, Fondante de Cuerne, and Early Rousselet. In September the number of varieties that ripen is legion, and need only be alluded to. Bearre Hardy.

TOMATO DISEASE.—I, like your correspondent, Wm. W., in Gardeners' Chronicle, p. 46, am of the opinion that atmospheric conditions have more to do with Tomato diseases than any other agency. I once planted some stout Tomato plants at the front of a Fig-house, thinking that I might thus economise space, and obtain a crop of Tomatos. Alas! the truth of the Scotch saying that the "best laid plans of men oft gang agley," was never more clearly illustrated, for out of the forty-eight plants so planted I did not get one sound fruit. I attributed this to the fact of my growing, or at least attempting to grow, Tomatos under conditions which were quite suitable to Figs, viz, in a moist warmth There was nothing in the to account for the collapse of the plants-ne chemical or animal manure, and I was convinced that the close, moist air was the sole cause of my failure, because of the fact that plants raised from the same packet of seed, growing side by side until they were a foot high, and then planted in a house where air was admitted in considerable volume, yielded a splendid crop of fruits, and they were quite free from disease of any kind. I admit front air night and day to my Tomato-house, from the time the first flower trusses open, and this air, in entering the house has to pass over a hot-water pipe in which there is always a slight amount of heat. Another batch of Tomato plaots is planted in the front of an unheated Peach case, having a west aspect, and these, despite the syringing and damping, inseparable from such a structure, afford excellent return, and the plants are free from disease, which in my opinion, is prevented by the lively current of air passing through the housse night and day. J. F. McLood.

note about the Tomato disease; will you allow me also a little space to give your readers my experience in some of the large Tomato-growing establishments. I remember once putting out some plants in the month of May to furnish seed, which became so badly diseased that it was thought prudent to throw them away. These plants had very little bottom-heat, but they were afforded top and bottom ventilation. This season I planted one house in the month of April, the plants were never syringed after being planted, and I find the disease is just beginning to affect some of them. There is a fine crop of fruit on them, and the worst cases of infection occur near the ventilators. I am sure the disease does not come in this case from imperfect ventilation or from damp, for they are never afforded water at night; but I do find that the disease is worst when plants are fed with animal manure, whilst others which are given Pearson's Chemical Manure are not so bad. I have a Tomato grafted on a Potato bearing eighteen fruits, and if it is any use will gladly send it to you. W. J. [Please do. ED.]

—— I have ample proof that bottom-heat is not conducive to the Tomato disease, as for several years I have grown a few plants in the Pine-stoves, and though the pots are not plunged, the roots find their way into the pan the Pines are plunged in and travel a great distance. The youngest of the plants are from seeds sown twelve months last February. We have a few in two other houses in pots plunged in leaves and manure, put there for other purposes, with a flow and return bot-water pipe underneath, with the heat always on, without any trace of disease. I think, like your correspondent, "Wim. W.," that water applied to the plants over-head, which the plant does not want, or an atmosphere charged with moisture, are responsible for the Tomato disease. All our houses are unusually dry, and a good deal of damping and syringing other things is resorted to in the spring months to keep down insect pests, but I have not seen a trace of the disease for some years. I would here suggest that the Superintendent at Chiswick should put this to

the test by syringing a few plants twice daily in a house where a number of others are growing to see what the result would be. Of course, it is rather late in the season for the suggestion, but it might he done another season. Some of our large private growers could conduct a similar experiment; but a report of an experiment of this nature, coming from the committee of the Royal Horticultural Society, should have more weight. I recently read a report of a technical lecturer advocating the syringing Tomato-plants to keep them free from red-spider and green-fly, pests that seldom visit them; and if they do get on them from other plants, the constitution of a Tomato-plant is more than a match for them, if provided with something to grow in, and water at the roots. If red-spider could make headway on the Tomato anywhere, it would be in the hot, dry atmosphere of the Pine-stove; but here again it is practically helpless. W. P. R.

STRAWBERRY VICOMTESSE HÉRICART THURY syn. GARIBALDI.-It is amusing to find attention being again directed to the merits of this excellent Strawberry and its identity with other aspirants to its fair name. One could have hoped that this question, once strongly debated, had been settled for ever. But not so. That they are identical settled for ever. But not so. That they are identical there is no manner of doubt; any little difference there may be being entirely due to cultivation. Having had a good deal to do with the Vicomtesse. it may not be altegether uninteresting to your readers were 1 to relate something of my experiences on the points raised, although it is not altogether in with that of my Edinburgh friends. The Vicomtesse lléricart du Thury Strawberry was raised and sent out by M. Jamin, and not by Vilmorin, as stated by Mr. Carmichael. I well remember the following circumstance in connection with this Strawberry Sometime during the summer of 1858, the late Mr. Gilbert, of Burghley, and your present correspondent were one day eugaged amongst the Strawberries in the old Horticultural gardens, when we noticed one variety very distinct in habit from all the others. The late Mr. R. Thompson, on being appealed to, said, in his peculiar manuer, "Ah! by-the-by, that's the——" but what he said we did not know until next day, when he had it reduced to writing. This proved to be Vicomtesse Héricart du Thury. Mr. Thompson told us it was a variety he had noticed in France on a recent visit to that country, and advised that it should be taken special care of. From that date the Vicomtesse Hérieart du Thury Strawberry became one of the most popular of Strawberries. It was largely grown in the Royal Horticultural Gardens, Chiswick, as a main crop variety, and thousands of plants were distributed amongst the Fellows of the Society. A little later on it became a very popular variety for market purposes around Edinburgh, Aberdeen, &c. In 1867 it is described in the pages of Le Bon Jardinier, with the further statement that the cultivation of this variety for market purposes is yearly increasing. In 1869 a highly eulogistic notice appeared in the *Journal of Horticulture*, where it is stated to be grown largely in various parts of the country. The statement that the Vicomtesse Héricart du Thury Strawberry was The statement that sent out the same year as Garibaldi, about thirty years ago, is altogether wrong, and has no foundation; the fact being that the Vicomtesse Héricart du Thury as a Strawberry was grown in the Royal Horticultural Gardens at Chiswick, some years before Garibaldi as a Strawberry, or as a patriot, appeared on the scene. A. F. Barron.

Some twenty years since, when I fruited Garibaldi eleven months in the year, and exhibited it at some of the meetings of the Royal Horticultural Society, it then caused some discussion in your columns, very similar to those of last week, whether the variety was not the same as Vicomtesse Héricart du Thury ; but I thought the matter quite settled at that time, the raiser's name being given, and the year it was raised in, also the raiser's name of the Vicointesse. My stock came from my friend Mr. Denning, when gardener at Surbiton, and that was all I knew personally of its origin. I had no doubt in those days that they were distinct, so far that they were raised by two separate persons, therefore they must be distinct; but the resemblance is such, that it would take a very clever person to distinguish it. Many years since, when exhibiting at York, there was a person exhibiting several golden tricolor Pelargoniums, but some of the varieties were so much alike, that no one, except perhaps the grower, could possibly distinguish them apart. However, the grower was so positive that they had certain marks about them that he could easily distinguish under any circumstances (which we could not),

that I tried to find out the grower's talented gifts; so when he was absent I removed four of these plants, marking them so that I could eventually put them in their preper places. In the course of the day I ventured with another friend to visit these said Pelargoniums, and again pointed out that some of the varieties were so alike, I could detect no difference. By But the grower still thought otherwise. 1 put my hand on two that I had marked and said, I could see no difference whatever in these; and some others (really the ones I had taken the two from). "Oh," said he, "I can easily point out the difference," and accordingly he began to describe it (he did not detect the change that had been made). Then, again, with the other two he was equally at fault—he never, of course, knew that I had rung the changes. Here we may again refer to the Rose, Tomato, Pea, &c., if these were mixed up, even the best growers could not tell them apart, as I have proved by repeating the golden tricolor dodge. So I think the question of Garibaldi and Vicointesse Strawberry may be summed up in a few words: no doubt they are not the same variety, but they are so much alike that when mixed up, it would be a very difficult matter to distinguish the difference. Edward Bennett, Queen's Road, Echam.

- The question as to the identity of these varieties is by no means a new one, nor is it quite so easily settled as "Fragaria" supposes. My old friend, Mr. William Carmichael, of 14, Pitt Street, Edinburgh, has gone up for the meeting of the Royal Horticultural Society at the Drill Hall on Tuesday next with some of his seedling Strawberries, and he may or may not agree to send up plants of these two varieties for fresh trial and testing at Chiswick. Would it not be more courteous for "Fragaria" to do as I and some others have done—carefully examine the two varieties as now growing side by side in Mr. Carmichael's gurden in Edinburgh, and report upon them under his signature in the Gardeners' Chronich! It may also be expected that Messrs. Dickson & Co., Edinburgh, may have something of importance to add to the statement, not yet contradicted, that they distributed Garibaldi the same year as the Messrs. Vilmorin of Paris the Vicomtesse Héricart du Thury, and that these two Strawberries are one and the same. There is yet another point. How did it come about that the Vicomtesse is hardly known or grown in Scotland, unless under the name of The name and fame of both these firms are like Casar's wife-beyond suspicion, and yet for a period of nearly thirty years both have been doing a brisk trade in one Strawberry, according to "Fragaria," under two names. It may be admitted that of late years the sorts have got considerably mixed, and perhaps very generally deteriorated; but so soon as I saw the two varieties true side by side in Mr. Carmichael's garden here, they recalled fragrant memories of what they were long, long ago. As Garibaldi is a Strawberry of great commercial importance around Edinburgh, the question of its purity, and the growing of the finest strain, is one of vital moment to growers. As to the authorities, they do not help us much in this matter. Were it an affair of Apples, Pears, Plums, Peaches, or Grapes, I should turn to the Royal Horticultural Society, the Orchardist, or Dr. Hogg's latest edition of his useful Fruit Manual, with more confidence. Scott in his Orchardist, says little of the Vicomtesse Héricart du Thury, and merely names Garibaldi as a new American variety. Dr. Hogg thus describes the Vicomtesse Héricart du Thury, and dubbs Garibaldi as a synonym, without a word of its dual introduction through the Scotch firm of Dickson & Co. the same year: "Fruit above medium size, conical, with an even surface; skin, deep scarlet, becoming deep red as it ripens; seeds yellow, slightly imbedded; flesh, pale red throughout, firm and solid, brisk sweet, and richly flavourel. This is an extraordinarily abundant bearer, and a valuable variety for general cultivation. In forcing it requires less light than most other varieties. The foliage is almost evergreen, and it remains long in the same ground." Is this Garibaldi, Vicontesse H. du Thury, or either, as grown by Fragaria? D. T. Fish.

— I read with much interest Mr. John Carmichael's notes on Strawberries, in your issue of July 1. There is, however, one point on which I incline to differ with the above gentleman, viz., that Royal Sovereign will supersede Sir Joseph Paxton, as during the past two seasons here Royal Sovereign has been nearly over before Sir Joseph

Paxton was ready. It seems to me therefore that Royal Sovereign cannot well be looked upon as a coming rival to Sir Joseph, but as a good variety to precede it. I shall be glad to have the opinion of other growers, as to their experiences with Waterloo, as I can neither get it to grow nor fruit, and have therefore discarded it. J. Wilson, Greenside Nuesery, St. Andrews, N.B.

FRUIT REGISTER.

PEAR DOYENNE D'ÉTÉ.

This fine early Pear has fruit below medium size, but of delicious quality, ripening at a season when good Pears are not plentiful. We gathered our first ripe fruits of this variety on July 8 from a standard tree, which is an abundant bearer every year, and this year the crop is heavier than usual. The fruit has to be consumed as fast as it ripens on the tree, as it does not keep in good condition for any length of time. The season for it is over before Citron des Carmes, the next best early Pear, comes in. R. Turnbull, Beachley Gardens, Chepstow.

MADRESFIELD COURT GRAPE SPLITTING,

Mr. Crump may recollect that it was only in extreme cases that I recommended boring the laterals of this and other tender-skinned Grapes. In any ordinary, well-ventilated house there should be no difficulty in finishing it without a cracked berry, and, when well done, it has no superior amongst black Grapes, but it is sometimes difficult in low, oldfashioned structures, such as I have had to do with at times, and which I had in my mind when I penned the paragraph referred to. With outside borders, and very inadequate means of ventilating. I more than once saved my crop during heavy rainfall by adopting the method he condemns, and, in spite of its barbarity I should certainly pursue the same course were I placed in a similar predicament. Wm.

GOLDEN CHAMPION GRAPE.

Will some kind reader kindly inform me if the above Grape was a seedling; if so, what sort was it raised from? If I remember aright, Messrs. Veitch, of Chelsea, sent this Grape out in 1870. The late Mr. P. Grieve, of Culford, thought this Grape was only a sport. Any information on the subject will much oblige. W. C. Leach. [This variety was raised by Mr. Thomson, gardener to the Duke of Buccleuch, Dalkeith Palace, from seeds sown in 1863. The Grape from which the seed was taken was, according to Mr. Thomson's statement in the Gurdeners' Chronicle for August 1, 1868, "a cross between the Champion Hamburgh and the Bowood Muscat," figure of a bunch, together with a description of the fruit, both furnished by Mr. W. F. Burbidge, then a student at Chiswick, will be found in the abovementioned issue of this journal. Whether the seed was obtained from a self-fertilised bloom or from another source can never be known. ED.].

RASPBERRY SUPERLATIVE.

I read the note by Mr. Woodgate in the Gardeners' Chronicle of the 11th inst., p. 44, and cordially endorse his remarks on the merits of the Superlative Raspberry. My experience with the variety extends over a few years, I having in the autumn of 1889 planted R. Hornet, R. Baumforth's Seedling, and Superlative. I was, however, obliged to discard the first two varieties after three years' trial of them, being satisfied that in our light soil they were not likely to be worth growing. I have now in bearing more than 200 stools of Superlative, and although we possess a somewhat large plantation of other varieties. they will all eventually have to give place to this excellent variety. It is the earliest to fruit with us, a most prolific cropper, has large and handsome fruit of good colour, and it is less liable to the magget, which is so prevalent in wet seasons. A word as to my treatment of the plantations may not be out of place. I select the fruiting canes for the ensuing year, early in the season-say about the middle of June; these are loosely tied to the trellis;

and the erop being over, the fruiting-canes are removed, and the young ones tied securely in their places, placing them about 6 inches apart-the length of the canes at that time being about 9 feet. These are left their entire length till the following spring. and then, there being no chance of severe frost occurring, they are reduced to 63 feet. The roots are carefully bared, and a thick layer of fresh cowdung is firmly trodden down over them, and this slightly covered with fresh soil. The trellises are 6 feet high, they stand 6 feet apart, and consist of stoutish iron-wire, secured at the ends to wooden posts squared to 4 inches, with intervening supports of a somewhat smaller size. J. F. McLcod.

SOCIETIES.

ROYAL HORTICULTURAL.

JULY 14. -Unfortunately, the date upon which it was arranged that the exhibition of Roses should take place, proved to be too late a one for so short and precocious a season as the present one, and although there were numerous collections entered in the fifteen classes provided by the society at the meeting held in the Drill Hall, James Street, Westminster, on Tuesday last, the general quality of the blooms was by no means first-class. There might have been made a better show at the meeting held in the same hall three weeks ago. Orchids were comparatively few on the occasion under notice, but several interesting ones were included in the small collection. Other plants and flowers were fairly numerous, but though there was a good display throughout the building, there were not many novelties, except in such plants as Carnations, Cannas, Sweet Peas, &c. Fruits and vegetables occupied rather more space than for some time past.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messes. J. Fraser, H. B. May, H. Herrst, R. Dean, J. H. Fitt, George Stevens, Jas. Hudson, J. F. McLeod, J. Fraser, R. Milligan Hogg, Chas. E. Pearson, H. Selfe Leonard, J. T. Bennett Poë, Jas. Walker, Edwin Beckett, H. J. Jones, C. J. Salter, H. Cannell, Chas. Blick, George Paul, and Harry Turner.

Messrs, Harriand & Co., Cork, were awarded a Silver Flora Medal for an excellent collection of double flowers of tuberous-rooted Begonias. There were about 150 blooms, staged with some of their own foliage, on a ground-work moss, and the effect was very pretty. A very considerable number of varieties were represented, and most of them may be commended for their merit. They had travelled

Messrs, Waltace & Co., Colchester, again staged an exhibit, consisting of varieties of Calochortus now in flower, which includes some very pretty ones of the medium and large-flowered sections; also a number of Lilium blooms in many varieties, especially a fine lot of L. longiflorum gigan-teum, and forms of L. Thunbergianum, a species which has given very numerous varieties. A First-class Certificate was awarded to L. concolor, a stender-growing species, about 1½ feet high, which produces small fery-scarlet blossoms, being only 1½ inch across. The flowers are spotted thinly and faintly with a darker colour. The group was awarded a Silver Banksian Medal.

Mr. H. ECKPORD, Wem, Salop, exhibited a small collection of his newest varieties of Sweet Peas, most of which were included in a large collection shown in the Drill Hall on a former occasion. On the present occasion Awards of Merit were granted to Queen Victoria, Prince Edward of York, and Lady Grisel Hamilton.

Sweet Peas were also largely exhibited by Messrs, Jas.

VEITCH & Sons, Royal Exotic Nursery, King's Road, Chelsea; and by Mr. F. C. Foster, Brockhampton Nurseries. In the former collection the bunches were interspersed with Gypsophila paniculata, and the effect was good. In each of the exhibits, however, there were many large-flowered varieties with distinct and pleasing colours. Both exhibitors were recommended Bronze Banksian Medals,

Sprays of ornamental flowering and foliage shrubs were exhibited by Messrs, J. Cheal & Sons, Lowfield Nurseries, near Crawley. Cut blooms of Pinks, Violas, &c., v shown by the Crawley firm (Silver Banksian Medal

Mr. M. PRITCHARD, Christchurch, Hants, exhibited a magnificent collection of hardy and herbaceous flowers now in season; all of them indicated successful culture. We noticed Chrysanthemum maximum var. G. H. Sage, several varieties enrysantnemum maximum var. G. H. Sage, several varieties of Coreopsis and Gaillardias, Echinopsis, and other such species; together with a few varieties of herbaceous Phlox, of which Wm. Robinson appeared to be one of the best. A berried spray of the Scarlet Fbler, Sambucus racemosa was also included. A Silver Flora Medal was awarded the group. Messes, Young & Dorinson, Stevenage, Herts, exhibited

cut flowers of various annuals and hardy species of plants.

A magnificent group of Ivies in pots, and representing numerous varieties, was exhibited by Messrs. Cutbush & Sons, Highgate Nurseries, London, N., many of the varieties included in this group are not commonly seen in gardens,

and the exhibit was composed of nice plants in healthy con-

dition and appearance (Silver gilt Flor) Medal)

Messrs, J.s., Vencu & Soss, Royal Exotic Nursery, Chelsea, exhibited sprays of several flowering shrubs, including Clethra canescens, a very fine shrub of handsome habit, and producing spikes of white flowers. First-class Certificate). also sprays of Sanbucus accessors, heautifully berried; and other things. The Chelsea firm also exhibited some more fibrous-rooted Begonias, with showy coral-red flowers; a basket of plants of a new strain of Streptocarpus, with larger These new flowers than the popular hybrids already known ones were referred to in our columns last week. Also a plant in flower of Didymocarpus malayanus. This new species, unlike most of the Didymocarpuses, has pale yellow flowers; it produces two to five upon slender spikes, and is apparently very free in blooming. The leaves are nearly orate, light green in centre, and darker towards edges. The upper surface is velvety and very pubescent (First-class Certificate).

From Mr. Jas. O'BRIEN, Harrow-on-the-Hill, came a plant Adiantum Bessonianum, from the West Indies, and thought to be a hybrid between A. tenerum and A. trapeziforme. It is a handsome Fern with rather dense-looking fronds, and belongs to the section with large pinnæ (First-class Cer-

Messys, Jso. Laing & Sons, Forest Hill Nurseries, London, S.E., obtained an award of Merit for a seedling Gloxinia named Mr. F. J. Edridge, a variety with light purple flowers of good substance.

A splendid Gaillardia was exhibited in sprays of bloom by Mr. G. H. Sage, gr. to Earl Dysart, Ham House, Richmond. The variety has been named Mrs. Sage, and is sure to become a popular one, by reason of its long and strong stems, and its fine, almost perfectly-formed flowers, in which the usual colours are more clear, and more decided (Award of

Messrs, H Cannell & Sons, Swanley, Kent, again made an excellent exhibit of large-flowered Cannas, many of which an excellent exhibit of large-flowered Cannas, many of which were comparatively new, but such good and well known varieties as Queen Charlotte, Madame Crozy, and others were also represented. Awards of Merit were deservedly made to Amy Jules Chrétien, a self-coloured flower of a shads approaching salmon-rose; and Aurora, a fine handsome flower of orange-scarlet.

Mr. W. Farr, gr. to Andrew Pears, Esq., Spring Grove, Isleworth, exhibited a pretty Caladium unnamed.

A. F. W. HAYWARD, Esq., exhibited a few excellent paintings of Roses, and a few Pansies Silver Flora Medal).

CARNATIONS were much to the fore, as might have been excepted for in the Angel.

expected, for is it not July, the month of the Gilly-flower. Foremost came Mr. C. Blick, gr. to Martin R. Smith, Esq., Hayes, Kent, who was fortunate enough to secure six Awards of Merit as follows: for Mr. Macrae, self, pale carmine-red, full and fine in petal; Boreas, self, rich marcon, flushed with bright crimson, extra fine; Dick Donovan, a superb white self, pure, and with stout shell-like petals; Blushing Bride, flushed with delicate pink, fine substance: Gladiator, a large purplish maroon self of fine quality; and Voltaire, pale yellow ground, with edging of soft purplishrose. In addition, Mr. Smith had Princess Maud, Helmsman, and Daisy, all fine white selfs, but, as shown, not equal to Dick Donovan, the first named slightly flushed with blush; Benzonian is a shaded dark maroon self, of fine quality of petal; El Dorado and Golden Eagle are yellow grounds; El Dorado being paler on the edge than Voltaire, and Golden Engle paler still; Judith is a pale purple self. with a fine petal, very promising.

Mr. J. Dougless, Bookham, Surrey, received an Award of Merit for Voltaire, and he had Mr Nigel, of a pale huff ground colour, heavily edged with crimson-marcon; Marathon, a large and full pale yellow ground, edged with pale rosy-red; El Dorado, Mrs. Alfred Tate, also a yellow ground, large and full; Ladas, yellow ground, having a slight edge of pale red; Firefly, whitish-sulphur ground, heavily edged with crimson; Winifred, a clear pale salmon self, decidedly promising, though not shown in its best character; Nabob, pale creamy-salmon, fine petal; Lady Ridley, and Mrs. Eric Hamhro', two fine white selfs; Black Prince, dark winecrimson; Bendigo, a bright purple self; Waterwitch, and Delicata, the last in the way of Alice Ayres, white, with lines of bright pale red.

Mr. C. Turner, Royal Nursery, Slough, had several boxes

of new Carnations, viz., Clio (Award of Merit), a heavy searlet-edged Picotee, full, pure in the ground, and finelyshaped petals, bright in colour; also Virgo, in the same way, with a broad edging of bright pale rosy-scarlet; May Queen (Award of Merit), pale bright-yellow ground, the petals edged and slightly lined with pink and purple-large and full; Primrose League (Award of Merit), sulphur ground, the petal-edges lined with purple-rose and pink, large, and of fine shape; The Gift, yellow ground, very fine, having a neat edge of pale red; Louisa Phillips, a clear pale-yellow self, deeper on the petal edges; Delos, a pale bright-red self. a fine full flower; Mrs. Douglas, yellow ground; Knight Errant, self, deeper in tint than Delos; Macelesfield, salmon-rose self, becoming a little paler with age; Sir Gny, a delicate blush self, in the way of Waterwitch; and I uchess, rosy-pink.

Jim Smith is a very bright scarlet-red self, a brilliant horder variety, which is very free, and is not a pod-burster Award of Merit), from Mr. H. G. SMYTH, Drury Lane, W.C. From Mr. E. Corry-Sharpin, Bedford, came a heautiful

From Mr. E. Corres-Sharpin, heavily edged with pale rosy-red, very fine shape and petal (Award of Merit). Mr. T. S. Ware, Ilade Farm Nurseries, Tottenham, staged a large number of bunches of Carnations set up with sprays

of Gypsophila, and they included the old Clove, Alice Ayres.

Germania, and many others, all useful border sorts (Silver Flora Medal).

Mr. W. C. TROUGHTON, Blackheath, had a small bright scarlet self, unnamed; a useful border s at. Mr. GEO. Radforn, Rugeley, had Miss Ellen Oldham, yellow ground, heavily edged with red.

Fine sprays of Pterocarya caucasica in fruit were sent from Mr. E. Burrel, gr. to H.R.H. the Duchess of Albany, Claremont, Esher (Vote of Thanks). Figured in Gardeners' Chronicle, 1894, vol. ii., p. 364.

COMPETITIVE ROSES.

The Tea Roses were remarkably good, but generally the hybrid perpetuals were wanting in colour and fulness.

There were two stands of twenty-four single trusses, distinct, the Silver Cup offered as a 1st prize being won by Mr. T. B. Havwoon, Woodhatch, Reigate (C. J. Salter, gr.), the blooms small, but clean and bright, the leading varieties Her Majesty, Madame Gabrielle Luizet, Mons. E. Y. Teas, Duc de Rohan, Captain Christy, Earl of Dufferin, Pierre Notting Eelair, very bright in colour; Madame Prosper Langier, and La France. The 2nd prize was awarded to Mr. C. J. Graname, Wrydelands, Leatherhead, with larger blooms, but the coloured H.P.'s were pale in tint.

In the open class for twenty-four single trusses distinct, the judges found some difficulty in coming to a decision, and awarded equal 1st prizes to Mr. George Mon'x, Rose Nurseries, Canterbury, and Messis. Paul & Son, Old Nurseries, Cheshunt. Mr. Mount had, for the time of year, regard being also had to the weather, some very good Roses, chief among them, Madame Eugène Verdier, Duchess of Bedford, Mrs. J. Laing, Charles Lefebyre, Gustave Piganeau, Ulrich Brunner, A. K. Williams, and Her Majesty. The leading flowers in Messis. Paul & Son's stand were Her Majesty, Marie Rady, Paul Neyron, and Duchess of Albany. A 3rd prize was awarded to Messis. D. Prior & Son, nurserymen, Colchester.

With twelve single trusses, distinct, the Rev. W. H. Jackson, Stagden Vicarrige, Bedford, was list with good clooms of Emile Hausburg, Duke of Connaught, Duchesse de Vallambrosa, Ferdinand Lesseps, Marquise de Castellane, Earl of Dufferin, Captain Christy, and Marie Rady. Mr. E. West was awarded the 2nd prize, his best blooms being Annie Wood and Captain Christy.

In the open class for twelve single trusses, distinct, there were six exhibitors, Mr. G. Mount taking the 1st prize with Earl of Dufferin, Madame Engène Verdier, Charles Lefebvre, Mrs. & Laing, Duke of Wellington, Caroline Testout, Duchess of Bedford, Ulrich Brunner, and Xavier Olibo; 2nd, Messrs, Park & Son.

Mr. W. TAYLOR, Hampton Hill, had a box of fresh and bright young flowers, which improved rather than deteriorated as the day waned.

With six single trusses shown by amateurs, Mr. J. Bateman, Rose Vale, Archway Road, N., was 1st with Her Magesty, A. K. Williams, Duke of Wellington, Madame Eugène Verdier, Gustave Piganeau, and Marie Bumann. The Rev. A. Foster-Mellian, Sproughton Rectory, Ipswich, was 2nd; his best flowers were Her Majesty, Madame Gabrielle

Luizet, and Camille Bernardin.
With six trusses of any one variety (an ateurs), Mr. R. H.
LANGDON, Raymead, Hendon, was 1st with La France, and
the Rev. W. H. JACKSON 2nd with Duke of Connaught.

With twelve distinct Roses, three trusses of each (open), Mr Gro. Mount was again placed lst, having fine blooms of Malaine Eugène Verdier, Ulrich Brunner, Mrs. J. Leing, Kavier Olibo, Gustave Piganeau, Earl of Dufferin, La France, Marie Baumann, and A. K. Williams; Messrs Paul & Son were 2nd, their leading flowers being Her Majesty, Marie Rally, Erlair, Mrs. J. Laing, J. B. Haywood, very bright in colour; and Duke of Connaught. Messrs. D. Phon & Son also competed. With twelve trusses of any one variety, Mr. G. Mount was 1st, with Mrs. J. Laing; and Messrs. Paul & Son 2nd, with the same; Messrs. Prior & Son staging A. K. Williams.

In the Tea and Noisette section there were four exhibitors of twenty-four single trusses in the open class, duplicates being allowed; and here Mr. O. G. ORFEN, West Bergholt, Colehester, was 1st with some charming blooms, chief among them Maman Cochet, Madame Hoste, Souvenir d'Elise Vardon, Catherine Mermet, Maréchal Niel, Madame de Watteville, Ernest Metz, Comtesse de Nachallec, Golden Gate, Sylph, new, a very pleasing variety; The Bride, Corinna, and Madame Hoste. 2nd, the Rev. A. Foster-Mellink, with Mata in Cochet, The Bride, Bridesin id, Niphetos, and Maréchal Niel, very fine in colour. The Rev. W. H. Jackson also exhibited.

Of twelve single trusses, there was but one exhibitor, Mr ALLEN CHARDLER, Bunch Liwn, Hislemere, who was placed 1st, with Souvenir de S. A. Prince, Madame Margottin, Comlesse de Nadaillac, Golden Gate, Comtesse de Laberthe, &c. With six single trusses (amateurs), Mr. R. E. West was list

With six single trusses (amateurs), Mr. R. E. West was 1st out of four exhibitors, h ving Anna Olivier, Souvenir de S. A Prince, Hon. Elith Gifford, Etoile de Lyon, Souvenir d'un Ami, and Innocenta l'rola; Mr. R. H. LANGTON was 2nd.

With single trusses of any one variety amateurs), Mr. O. G. Ohpen was 1st, with Maman Cochet; the Rev. W. H. Jackson being 2nd with Innocente Pirola.

In the open class for twenty-four Tea and Noisette Rises distinct, Messrs, D. Prior & Son were 1st with decidedly good blooths of Comtesse de Nadaillac, Souvenir de S. A. Prince, The Bride, Marie Van Houtte, Ernest Metz, Souvenir d'un Ami, Madame Serpon Cochet, Manan Cochet, Maréchal Niel, Princess Vera, Innocente Pirola, Jean Ducher, Niphetos, Caroline Kuster, Edith Gifford, and Mrs. Jas. Wils n; 2nd,

Messrs. Paul & Son, who had Madame Cusin, Etoile de Lyon, Souvenir d'Elise Vardon, Marèchal Niel, Jean Ducher, Maman Cochet, and Comtesse de Nadaillac.

With twelve distinct Teas, three trusses of each (open), Messrs. D. Prior & Son were again 1st, having Caroline Kuster, Ernest Metz, Niphetos, Maréchal Niel, Souv. de S. A. Prince, Souv. d'un Ami, Comtesse de Nadaillac, Innocente Pirola, Marie Van Houtte, and Maman Cochet. Messrs. Paul & Son were 2nd, their leading varieties being Ernest Metz, Niphetos, Comtesse de Nadaillac, and Madame Cusin. With twelve single trusses of any one variety, Messrs.

With twelve single trusses of any one variety, Messrs, Paul & Son took the 1st prize, having Innocenta Pirola; Messrs, Paul & Son were 2nd, with Maman Cochet; Mr. Mount showing Madame Cusin.

Messis, WM, Paul. & Sox, nurserymen, Waltham Cross, staged several large bunches of new Tea Roses, prominent amongst them Empress Alexandra of Russia, salmon-rose, deepening to rose colour, full, and quite distinct (Award of Merit); Francis Dubrenil, a crimson Tea, with the shape of a H.P., fine in the bud, full in substance Award of Merit); Sylph, cream, suffused with fleshy-pink in the centre; Rosomane de la Huger, soft creamy flesh, very chaste and pleasing; and H.P. Waltham Standard, pale rose, as shown, fine in shape, and decidedly promising.

fine in shape, and decidedly promising.

Mr. W. Russey made a good exhibit of cut Roses, for which he was awarded a Silver Banksian Medal.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the Chair; and Messrs. Jas. O'Brien (Hon. Sec.), E. Hill, J. Jaques, Thos. Statter, W. Cobb, C. Pilcher, F. Sander, A. Bogaerde, De B. Crawshay, C. Winn, W. Thompson, W. H. White, H. J. Chapman, T. W. Boud, N. C. Cookson, H. Ballantine, A. H. Smee, H. M. Pollett, J. Douglas, and R. Young.

As is usual at this season of the year, there was a falling off in the number of the exhibits staged, and the greater

part of those sent consisted of cut spikes.

One of the attractions of what are called botanical plants is, that they fairly distribute their interest over the whole year, and are consequently more noticeable when the flowers of the showier genera are scarce; of such there were a few exhibits. Sir TREYOR LAWRENCE, Bart., Burford, Dorking (gr., Mr. W. H. White), staged a neat group composed of Cattleys Eldorado marginata, of the C. E. splendens class, but with clear rose purple margin round the side lobes of the lip; C. E. Wallisii, pure white with orange centre; a well-flowered plant of Dendrobium McCarthia; the singular green and white Catasetum Russeltanum (Botanical Certificate), a fine example of the orange and red Masdevallia corniculata (Botanical Certificate), the pretty One-filium virgulatum (Botanical Certificate), Lelia Lucasiana, Polystachya odorata, the singular Epidendrum volutum, Zygopetalum Burtti Wallisii, and the handsome Zygopetalum grandiforum, with greenish sepals and petals tinged with chocolate colour, and white and violet fringed hp, Award of Merit).

The Right Hon. Lord Rothschild, Tring Park, Tring gt., Mr. E. Hill), sent a noble six flowered inflorescence of Pattleya Warscewiczii (gigas) Shuttleworthii, an example of what may be attained by well growing a fine variety (Cultural Commendation); also Cattleya Gaskelliana alba, and the pretty little M selevallia Carderi (Botanical Certificate).

The Right Hon. J. CHAMBERLAIN, Highbury, Birmingham gr., Mr. Burberry), sent a selection of very fine varieties of Cattleya Warseewiczi (gigas) all good, and very dissimilar

from each other (Vote of Thauks).
C. J. Leevs, Esq., Warnham Court, Horsham (gr., Mr. Duncan), also showed fine varieties of Cattleya Warscewiczii, of which those named gigantea and purpurea were the best (Vote of Thauks).

Thos. Statter, Eq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed Cypripedium Godefroyae leuco-coilum and cut oxamples of Cattleya Warseewiczai delicata, C. Rex, C. Gaskelliana, C. Schoderiana, Lelia-Cattleya x elegans, L.-C. > Schilleriana, L. purpurata, L. tenebrosa, Cypripedium Curtisii, C. superbiens, C. × Harrisianum superbum, and C. - selligerum majus (Vote of Thanks).

EDGAR COTEN, Esq., Hall Road, St. John's Wood (gr., Mr. A. Vass), showed Cattleya Mendelli Mrs. Edgar Cohen, a charming white form with rose spot on the lip and faint like tupes on the notals.

tinge on the petals.

Mesers. Heart Low & Co., Clapton, sent Cattleya Mossiae

Brilliancy" (Award of Merit), a very fine dark coloured variety; C. M. Arnoldiana, and C. Mendeli.

REGINALD YOUNG, Esq., Liverpool (gr., Mr. Poyntz), showed cut examples of Cypripedium Stonei caudidum and C. × Harrisianum superlum

Harrisianum superbum.

W. Thomeson, Esq., Walton Grange, Stone, Staffordshire (gr., Mr. W. Stevens), showed Odontoglossum luteo-purpureum sceptrum; O nebulosum candidulum, and a very pretty and profusely-flowered collection of Cochloda Noezliam (Vote of Thanks).

J. Wilson Potter, Esq., Parkhill Road, Croydon, exhibited a fine specimen of the singular white Acranthus grandiflorus, which he had successfully cultivated for a considerable time it being the dant illustrated in the Occabild Album.

able time, it being the plant illustrated in the Orchid Album.

Messrs. F. Sanden & Co., St. Albans, showed a noble specimen of the white and fragrant Cellogyne Sanderiana with six fine spikes (Cultural Commendation), and two plants of the pretty dwarf rose-purple Spathoglottis plicata Micholitzii.

MICHORIZE.

NORMAN C. COOKSON, Esq., Oakwood, Wylam-on-Tyne, showed two Phaius Humblotif, and one of the rich rose P. Henryii, and a flower of a fine form of Cypripedium A Youngianum.

At the conclusion of the meeting, REGINALD YOUNG, Esq., of Liverpool, explained his system of recording hybrid Orchids, and handed to the Secretary the Cypripedium records on his plan, which it is hoped will be of great service. A cordial Vote of Thanks was given to Mr. Young.

Fruit and Vegetable Committee.

Present: P. Crowley, Esq. (in the chair); and Rev. W. Wilks, and Messrs. H. Pearson, J. Cheal, A. F. Barron, T. J. Saltmarsh, T. Fife, J. Snith, G. Reynolds, G. Sage, T. Farr, C. Herrin, J. H. Veitch, W. Bates, A. Dean, J. Willard, and J. Wright.

Mr. E. Beckett, gr. to H. H. Gibbs, Esq., Aldenham Park, showed a collection of vegetables, receiving an award of a Bunksian Medal. The vegetables were good for the season and the time of year, excepting the two lots of Caulifowers that were open and too big for the best table. Tomatos, Cutbush's Polegate, and T. Perfection, were capital fruits, smooth, large, dark-coloured and ripe. Beetroot consisted of Suttons' Crimson Globe Beet, a form of the Egyptian beet, and Pragnal's. Onions were large and fine, though to our thinking too much deunded of the outer layers; they on-sisted of Red Leviathan and White Leviathan forms of Tripoli Onions. Pea Autocrat had a pleasing dark-green colour, and was gathered just at the right time. Nice examples of Moure's cream Vegetable Marrow, Sharpe's Victor Potato, a shapely example of this favourite early kidney; and the Royal Ashleaf kidney; Sutton's Magnum Bonum, and Canadian Wonder French Beans; Sutton's Gem - Carrot, apparently a selection of the Carentan, and New Intermediate; Green Globe Artichoke, a very good lot; Cucumber Victory, a nice, medium sized, smooth variety of a dark-green colour, and the samples shown were in perfection; and Bro d Bean Leviathan (aqua dulce), the number of whose seeds is in inverse ratio to its length.

Messrs. W. W. Johnson & Sox. Boston, Lincolnshire, showed about fifty dishes of Peas, consisting of most of the popular varieties. We noted Boston Unrivalled, Consumate, a curved, seimitar-like pod of a dark green colour; Ambassador, Royal Jubilee, The Daisy, Veitch's Perfection, Alderman, Duke of Albany, Invincible Marrow, Early Marrowfat, The Duchess (of Albany), Critic, Satton's Prizewinner, ditto Eureka, Windsor Castle, &c. Many of the pods shown were filled, and past their best for cooking purposes, We think that to show culinary Peas in so forward a condition is a mistake.

A pretty Cucumber was shown by Mr. W. Palmer, Andover, and named Palmer's Graceful. It was short, smooth, dark green, and tapering gradually to a long point and having a neck too long for so short a fruit. Hence probably its being passed by.

Mr. W. CARMICHAEL of 14, Pitt-st., Edinburgh, and formerly of Sandringham, showed Strawberries, Prince of Wales=Waterloo × British Queen; Princess of Wales=Latest of all > Frogmore Late Pine; Wm. Carmichael = Waterloo × British Queen; and Queen of Danemark = Frogmore Late Pine × Waterloo. These are, we believe, to be tested at Chiswick. A number of dishes of Tomatos by various exhibitors were tabled but nothing of superlative merit was observed. Most of them seemed to be of the smooth Perfection type.

Several Melons were shown, and one-a white fleshed variety named Effingham Perfection = Hero of Lockinge x W. Tillery from Mr. ALDERMAN received an Award of Merit.

Messrs, J. Veitcu & Sors, Royal Exotic Nurseries, Chelsea, exhibited about a score of dishes of Cherries in distinct varieties. We remarked fine fruits of Reine Hortense, Bigarreau Napoleou, May Duke, Governor, Wood, Cleveland Bigarreau, Tradescant's Heart, Baumann's May, and Black Hawk. They also showed fruits of the Pears Citron des Carmes and Doyenne d'Été; varieties of Black, Red, and White Currants; Superlative Raspberry; and twenty-six distinct dishes of Gooseberries.

Mrs. Abbot, South Villa, Regent's Park (gr., Mr. Kelf),

Mrs. Adrot, South Villa, Regent's Park (gr., Mr. Kelf), showed excellent fruits of Peaches, Dymond, Royal George, and Dr. Hogg. These were as good as possible in size and colour, although grown within two miles of Charing Cross. A Banksiau Medal was awarded.

Lecture on New Roses.

In the afternoon a paper upon this subject written by the successful amateur, the Rev. J. II. Pemberton, was read by the Assistant Secretary.

Mr. Pemberton remarked upon the wonderful development of the Rose that has taken place in comparatively recent years, and as an instance gave a short list of varieties that were found in an old catalogue. It was also remarked that the development of one section was most rapid for a few years, and that afterwards attention appeared to be concentrated upon a different section. Then the race of Hybrid Teas was originated by the introduction of Cheshuat Hybrid, since which time there have been numerous such varieties, most of which have become very popular. Mr. Pemberton said that the qualities which exhibitors desired to find in New Roses were only size, form, and colour, but that as Rose lovers and Rose cultivators very many times outnumbered the Rose exhibitors, raisers should be particular that a new Rose possesses other virtues before they venture to introduce it into commerce. Such virtues were, scent in the flower, hardiness in the plant, and a habit of free blooming. Undoubtedly the greater number of newly-introduced Roses were worthless, and only a few seasons were necessary to prove this so fully that their names were almost forgotten.

A greater care was necessary on the part of nurserymen who ntroduce Roses to the public in order that they may ascertain themselves whether or not each variety is worthy cultivation.

At the end of Mr. PEMBERTON'S paper was appended a list of the best Roses that have been introduced during the past seven years, and remarks upon some of these were given.

It was a misfortune for rosarians that Mr. Pemberton was net himself present.

Sir ALEXANDER ARRUTHNOT condemned the action of the National Rose Society in prohibiting certain varieties of undoubted merit from a place among general exhibition Roses. An instance was given in Ernest Fürst, a Rose of somewhat smaller size than many exhibition varieties, but which possessed unquestionable merits apart from this, though not included in the Nat. Rose Soc. catalogue. Sir ALEX. ARBUTHNOT protested against the term Exhibition Rese at all, and urged that at the National Rose Society's exhibitions, encouragement should not be exclusively given to flowers of large size.

Mr. WALTER EASLEA of Messrs. W. Paul's Nursery, at Waltham Cross, also made a few remarks, and enumerated about a score of varieties that it was urged should have been ncluded by the lecturer.

TUNBRIDGE WELLS HORTI-CULTURAL.

July 8.—Although not quite up to the average, the thirtyeighth exhibition of this society held on the above date was airly goed.

In the open classes there were few competitors from a distance; and, for the most part, they were won by winners n the local classes.

Mr. J. Mason, gr. to H. J. Wood, Esq., Pulborough, Kent, was 1st for four stove and greenhouse plants; and Mr. S. Pope, gr. to J. J. Barrow, Esq., Holmwood, Tunbridge Wells, won for four ornamental foliage plants. Mr. T. PORTNELL winning for four exotic Ferns.

Groups were decidedly weak, the best coming from Mr. J. Howes, gr. to W. Cobr. Esq., Broadwater Down, who was also well in front for nine Orchids, a grand piece of Odontoglossum var. Cobbianum and Epidendrum vitellinum being included. Mr. J. Mason was 2nd, and Mr. L. Durond 3rd Mr. Dupond had a superb piece of D:sa grandiflora.

Cut flowers were good, and the collections of herbaceous perennial flowers grand. The 1st prize for twenty-four species was awarded to Mr. J. Charlton, Tunbridge Wells. Mr. R. Edwards, Beechey Lees, Sevenoaks, was 1st for three pieces of table decorations; and Mr. S. Cook, gr. to De B. Crawsnay, Esq., Rosefield, Sevenoaks, was 1st for a decoratien, consisting of Roses only

Mr. PORTNELL was 1st for eighteen bunches of stove and greenhouse flowers.

Wreaths and floral designs were goo , a pretty wreath from Mr. J. Gore, Polegate, and an anchor from Mr. Webber, Tunbridge, being adjudged 1st and 2nd respectively.

Mr. J. CHARLTON was well ahead for both bride and hand benquets; Mrs. A. HATTON, Sevenoaks, following in each

Roses were fairly good for the season. Mr. G. MOUNT. Canterbury; Messrs. G. BUNYARD & Co., Maidstone; and Mr. G. W. Piper, Uekfield, taking prizes in the above order, both in a class for forty-eight varieties, and in one for twelve Teas or Neisettes.

Mr. J. Salter, gr. to T. B. Havwood, Esq., Reigate, was 1st in all the amateurs' classes, and showed some good blooms. In the 2nd prize stand for twenty-four varieties there was a good bleen of Grand Mogul from Mr. Harris, gr. to E. M. Bethune, Esq., Horsham, and which won the National Rose Society's Silver Medsl for best H. P. in the show.

Fruit.—Grapes were good; the 1st prize, for three bunches of black Hamburgh, going to Mr. C. F.RL, gr., Summerbill, Tonbridge, but he was beaten for three bunches of any other black variety by Mr. W. LAKER, gr. to A. G. LINOFIELD, Esq., Werthing, who was also lst for three splendidly finished bunches of Muscat of Alexandria. Mr. J. Snow, Wadhurst Park Gardens, Sussex, winning in the class for any other white variety.

The 1st prize for six Necturines and six Peaches went to Mr. C. Harris, gr. to O. A. Smith, Esq., Hammerwood, East Grinstead. Mr. C. Earl winning for a collection with some well-finished fruits.

The following classes were open only to those residing within a 6 miles radius of the South-Eastern Railway Station: Mr. S. Pore won in the class for six good stove and greenhouse plants; Mr. J. Mason had the best collection of four plants; S. Pope won for six ornamental foliage plants; and Mr. J. Mason for six table plants.

Begonias and zonal Pelargoniums were good, but Fuchsias begomas and zenar retargomains were good, but fuchsias were not shown well. A Silver Medal presented by Messrs. J. Laing & Sox, Forest Hill, for twelve tuberous-rooted Begomias was secured by Mr. W. H. Wickens, gr. to J. Wheelwhight, Esq., Neville Park, Tunbridge Wells, who had a nice collection.

A collection of Melons from Messrs. SERGEANT & Co., Worthing, attracted much attention from the visitors.

Caladiums from Messis. J. Peed & Son, Forest Row; herbaceous cut flowers from Mr. J. Charlton, and from Mr. M. PRITCHARD, Christchurch; also a quantity of cut Roses from Mr. G. W. Pifer, Uckfield, were the chief among non competitive exhibits.

NATIONAL ROSE NORTHERN SHOW AT ULVERSTON.

JULY 15.-In spite of the indifferent season and continued dry weather, there were a few good blooms at this show. Decidedly the brightest of blooms came from Yorkshire, while the best Teas were from Oxfordshire. Neither Mr. R. B. Cant, nor Messrs, F. Cant & Co., from Colchester, were exhibitors. O. G. Orpen, Esq. was also absent. In some of the local classes competition was keep if exhibits were not numerous; more than one instance occurring where a single point only divided the first and second.

NURSERYMEN.

Six competed for the Jubilee Trophy and Gold Medal with airty-six distinct varieties. Messrs. Harkness & Sons, thirty-six distinct varieties. Messrs. Harkness & Sons, Bedale, Yorks, staged very bright and clean flowers, just beating Messrs. A Dickson & Sons, Newtownards, Ireland, 2nd, who also had good blooms. The winning thirty-six were Horace Vernet, François Michelon, Comte Raimbaud, Gustave Piganeau, Dr. Andry, Mrs. John Laing, Charles Lefebvre, Mme. E Verdier, Captain Hayward, Marchioness of Dufferin, Earl of Dufferin, and Etienne Levet in the back rew; Duc de Rohan, Marie Rady, Maréchal Niel, Madame Heste, Duchess of Bedford, Alfred Colomb, John Stuart Mill, La Boule d'Or, A. K. Williams, Comtesse de Nadaillae, Fisher Holmes, and Countess of Rosebery in the centre: with Beauty of Waltham, Catherine Mermet, Pierre Notting, Avocat Duvivier, Duke of Wellington, Mme. Hausmann, Caroline Kuster, Prince Arthur, Her Majesty, Duke of Edinburgh, Edward Andre, and another in front.

J. Cocker & Son, Aberdeen, were a close 3rd. Messra W. & D. CROLL, Dundee, Messrs, Mack & Son, Yorkshire, and G. Paul & Sons, Cheshunt, also exhibited.

Messrs. A. Dickson & Sons, Newtownards, beat Messrs. Harkness & Son for seventy-two single blooms, being fol-

lowed by Messrs. W. & D. Croll, Dundee.

Messrs. Dickson & Sons also won for thirty-six varieties, three of each; Messrs. R. Mack & Son, Catteriek Bridge, having a very bright let for 2nd, and Mr. G. Mount,

Cantorbury, 3rd.
Mr. H. Merryweather, Southwell, Notts, was 1st for thirty-six single dooms, Messrs. Cocker & Sons, Aberdeen, 2nd, and Mr. G. Mount, Canterbury, 3rd; while for eighteen distinct, three of each, Messrs J Cocker & Sons, Messrs. MERRYWEATHER and Mr. G. MOUNT took prizes in like order,

The twelve treble Teas from nurserymen were good, Mr. J. MATTOCK, New Headington, Oxfordshire, winning with good examples of Maman Cochet, Edith Gifford, Catherine Mermet, The Bride, Princess of Wales, Innocente Pirola, C. de Nadaillae, Marie Van Houtte, Ernest Metz, Marechal Niel, Jean Ducher, and Anna Olivier; Messrs. PRIOR & Son were a good 2nd, and Mr. MERRYWEATHER, Southwell, 3rd,

Messrs. Paton & Son were 1st for eighteen distinct, single blooms of Teas, but the flowers were loose. Messis, A DICKSON & SONS, Newtownards, and Mr. MOUNT, Canterbury, followed

Mr. J. MATTOCK, New Healington, Oxford, had a grand stand in a class for twelve varieties; Mr.H. MERRYWEATHER having the medal Tea or Noisette in Maman Cochet among his 2nd prize stand-blooms.

AMATEURS.

The Jubilee Trophy and Gold Medal for twenty-four varieties were secured by the Rev. J. H. Pembeaton, Haveringatte-Bower, with Earl of Dufferin, Her Majesty, A. K. Williams, Marchioness of Londonderry, Charles Lefebvre, Marchioness of Dufferin, Marie Baumann, Madame E. Verdier, Gustave Piganeau, John Stuart Mill, Souvenir de S. A. Prince, Horace Vernet, Caroline Testout, Dupuy Jamain, Mrs. J. Laing, Mar-Vernet, Caroline Testout, Dupny Jamain, Mrs. J. Laing, Marshall P. Wilder, Madame Deville, Prince Arthur, Xavier Olibo, Comtesse de Nadaillac, E. Y. Teas, Danmark, Countess of Rosebery, and Queen of Queens. H. V. Machin, Esq., Gateford Hall, Worksop, was 2nd, and E. B. Lindsell, Esq., Hitchin, 3rd.

The three pieces of plate given by the president of the local society for thirty-six varieties were secured by A. WHIT-TON, Esq., Bedale, who staged an excellent lot; by Mr. E. B. Lindsell, whose lot contained the Silver Medal Tea bloom among amateurs in Catherine Mermet, and Rev. J. H.

For eight varieties, three of each, Rev. J H PEMBERTON was in front of H. V. Machin, Esq., Gateford Hall, Worksop, both being good stands for this season.

For eighteen varieties from growers of less than 2,000

plants, Mr. J. T. Marspers, Delamere, Silverdale, was lst; and also for twelve in a class open only to growers of less than 1,000 plants. The class for six single flowers from growers of less than 500 plants, found no competitors. The Veitch Memorial Medal and £5, for twelve Roses was won by R. P. LANDON, Esq., Brentwood, R. E. West, Esq., Reigate, being Mr. Landon was also in front for four varieties, three of each; this time he being close run by J. T. MARSDEN, Esq.,

The Rev. J. H. Pemberton, Hovering-atte Bower, was 1st with Mrs. John Laing for nine of any H.P. Rose; and Mr. H. V Machin, 2nd with Marie Baumanu. The same order was kept in the class for six New Roses

TEA SCENTED AND NOISETTE ROSES

H. V. Machin, Esq. Worksop, was 1st for twelve varieties, and W. Boyes, Esq. Derby, 2nd. Mr. Machin put up good flowers of Maman Cochet, and Mr. Boyes six of C. de Nadaillac. From growers of less than 500 plants, the Rev. J. H. PEMBERTON was 1st, and E. Mawley, Esq., Berkhamsted, 2nd for nine Teas

Mr. R. P. LANDON'S (Brentwood) six were the best from growers of less than 200 plants; Madame Hoste, Souvenir de S. A. Prince, Madame Cusin, Cleopatra, Ernest Metz, and Belle Lyonnaise being the varieties shown. J. T. MARSDEN, Esq., and Miss Johnson followed.

Mr. H. V. M achin, Worksop, was 1st for six varieties three of each; and Mr. J. T. Marsden 1st for six of any kind with Edith Gafford.

For twelve new Roses Messrs, Dickson & Sons, New,

townards, were the only exhibitors, but their stand centained no remarkable novelty.

For twelve blooms of any white Roses, Messrs. Prior & Sox, Colchester, were 1st with Niphetos; Mr. J. Mattock 2nd, with The Bride; and Messrs. D. & W. Croll 3rd, with Merveille de Lyon.

Mr. J. Mattock was 1st for twelve of any yellow Bose, with Comtesse de Nadaillac; Messrs. Burrell & Co., Cambridge, 2nd with Maréehal Niel, and Messrs. D. PRIOR & Son, 3rd with Madame Hoste.

For twelve of any light-coloured Rose, Messrs. A. Dick & Son, Newtownards, were well in front, having Mrs. W. J. Grant in better form than we have before seen it. Messrs. J. COCKER & Sons, Aberdeen, followed with twelve of Caroline Testout, and Mr. G. Mount 3rd, with fairly good Mrs. J Laing.
Messrs Mack & Son, Catterick Bridge, Yorks, wen with

twelve of A. K. Williams; Messrs. J. Cokker & Son 2nd with Ulrich Brunner; and Messrs. Harkness 3rd with A. K.

For Garden Roses, Mr. H. V. Machin, Worksop, won in a class for twelve varieties. Messrs. Paul & Son, Chesbunt, and Mr. J. Mattock being 1st and 2nd for eighteen bunches. Mr. J. Mattock was a decisive winner for a display of Roses, putting them up in good taste.

The best H. P. in the nurserymen's division was Vietor Hugo from Messrs R. MACK & Son, Catteriek Bridge; and the best Tea a good flower of Maman Cochet from Mr. J. MATTOCK, Oxford.

In the amateur's division, the medal H. P. was a fine bleom of Her Majesty from Mr. MARSOEN, and the Tea or Noisette, was a Catherine Mermet from Mr. E. B. LINDSELL, Hitchin,

This time Messrs. A. Dickson & Sons secured the Gold Medal for Muriel Grahame as a new seedling or sport. The blooms were better and more distinct than we have seen them bitherte.

Other medals were awarded in local classes, a good flower of The Bride winning a piece of plate as a best bloom, and another medal also as the best Tea in these classes. The medals for both light and dark H.P.'s went to Mr. J. H. MIDGLEY, Berner's Close, Grange, for Mr. J. Laing and Charles

LOCAL CLASSES.

A Silver Cup for nine distinct singles was won by Mr. J. T. Marsnen, Silverdale, with Mrs. J. Laing, S. M. Rodocanachi, La France, Charles Lefebyre, The Bride, Ulrich Brunner, Catherine Mermet, Alfred Colorab, and Cleopatra. Mr. J. H. Middlev was a very close 2nd, and Mr. W. Wilding Pennington, 3rd.

Mr. MIDGLEY beat the Rev. R. T. LANGTON for eighteen single blooms, and he was a good 1st for twelve varieties. T. W Mason, Esq., the Gardens, the Misses Case, Lyndon, and J. Atkinson, Esq., Croftland, stood in the above order for six blooms.

J. T MARSDEN, Esq., Delamere, Silverdale, won for six of any light-colonred Rose; J. H. Mitsgley, Esq., for six of any dark variety; and J. T. Marsben, Esq., was again in front for six of any white one, with Marchioness of Londonderry.

Mr. J. T. Marsden, beat the Rev. R. T. Landon for six Teas and Mr. J. Ward, Barrew-in-Furness won for three Teas.

There were grand displays of Sweet Peas from Messrs, ECKFORD & CO., Wein, Shrepshire; Herbaeeous flowers from Mr. W. Shand, Lancaster; Roses, Carnations and Picotees from Messrs. Dickson, Chester; Violas, Pansies and Carnations from Mr. S. Pye, Garstang, Lancs; and some really good seedling and other Carnations from Messrs. PRITCHARD & Son, Shrewshury.

TRADE NOTICE.

MR. NORMAN DAVIS has removed from Camberwell (where he has been connected with the Chrysanthemum world for over twenty-five years), to the Chrysanthemum Nnrseries, Framfield, Sussex.

ENQUIRIES.

FLOWERS OF SULPHUR.-Will some of the correspondents of the Gardeners' Chroniele kindly inform Examiner whether experiments have been made with sulphur in small proportions for cleaning the seeds of Turnip and Rape, or in fact any of the Brassicas? Quantities of dust-like mites breed nearly every year amongst the seed, and I am of opinion that if the operation be properly carried out, sulphur has the property of killing them. I shall be glad to know if suiphur is deleterious to the seed.

What is the "magical spit" mentioned by Sir T. "The magical spit made of [No?] rare plants, Brown ? which wind before the fire, and roasts the bird without turning." Garden of Cyprus, p. 159.

TREE FERNS (see p. 469, Gard. Chron., April 11, 1896).—In reply to a correspondent who made enquiries on this subject, may lask him to communicate as follows, O. E. Menzel, Botanical Collector, Aldgate, South Australia.

The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.

10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 11, is furnished rom the Meteorological Office :-

"The weather was generally fine, bright, and dry over the greater part of England, but severe thunderstorms and very heavy rain were experienced at several of the inland stations about the middle of the week. Over Ireland, Scotland, and the north-west of England the conditions were mostly cloudy and unsettled, with rather frequent rain. The rain experienced on Wednesday and Thursday was very heavy. At the end of the week the weather was fine in all parts of the kingdom.

"The temperature scarcely differed from the normal in Ireland and Scotland, but was above it over England, the excess in 'England, S.' being as much as 5. The highest of the maxima were recorded either on the 6th, 7th, or 9th over the maxima were recorded either on the 60b, 7th, or 9th over England, but on irregular dates at the Irish and Scotch stations. They ranged from 86 in 'England, E and 8.,' and 83' in the 'Midland Counties,' to 72' in 'Scotland, N. and W.' The lowest of the inmina (which were registered on very irregular dates) varied from 40° in 'Scotland, E.' and 'Ireland, S.,' and 42° in 'Scotland, N.,' to 50° in 'England, S.' and 55° in the 'Channel Islands.'

"The rainfall greatly exceeded the mean over Ireland, the east and west of Scotland, and in the north-west of England, and slightly exceeded it in 'England, N.E.' In 'Scotland, N,' and the other English districts, there was a deficit, the total fall in 'England, S.' and the 'Channel Islands' being very slight. On the 7th a storm of hail of unusual severity was experienced in the neighbourhood of Circucester.

"The bright sunshine was deficient in almost all the western and northern districts, but exceeded the mean over all the more eastern, central, and south eastern parts of England.
The percentage of the possible duration ranged from 61 in
'England, S. and E, and from 47 in the Channel Islands. to between 24 and 29 in Ireland, and to between 23 and 26 in Scotland."

MARKETS.

COYENT GARDEN, JULY 16,

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kurdness of several of the principal salesmen, who revise the list, and who are responsible for the quotitions. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the day, but often several times in one day. En.]

SEEDS.

LONDON: July 15. - Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, Loudon, S. E., report a moderate inquiry for Trifolum; English samples come good and chesp. New Rape seed and Rye are now showing. Sowing Mustard realises former terms. New Winter Tares are inquired for. The trade for Poss and Haricots is fo ture-less. New Canary seed for forward delivery is distinctly firmer; spot parcels, however, show no material improve-

FRUIT AND VEGETABLES.

NOTICES TO CORRESPONDENTS.

Bellegarde Peaches: F. B. The fruits were well coloured and not at all "woolly" as was suggested by your employer. One, however, was gathered rather too soon. We have seen larger fruits of Bellegarde than those you send.

BOOK PUBLISHERS: Renfrew. Millar's Dictionary, John Murray; Bentham's Handbook, Lovell Roeve. Others not known.

BOTHY: Zeta. A bothy for four gardeners should contain one good-sized common room; one bed-room for each man, a small kitchen and scullery combined, together with a lavatory, water-closet or earth-closet, and a soft-water tank. Each man should possess a lock-up cupboard. A partly-inderground partry should be provided on the coolest side of the building. If it could be managed, the bedrooms should be placed upstairs. It would scarcely be a fit residence for a married couple. The usual practice is to have an elderly woman to attend to the bothy, her hours being from 7 a.m. till 6 p.m. Any architect would furnish a plan for the structure.

CARNATIONS: Leamington. Probably the effect of too strong light.—W. B. We cannot name varieties of florists' flowers; send to someone who grows specialties.

COUCH GRASS IN A NURSERY: E. H. B. The clearing the ground of the roots is a difficult operation, and cannot be undertaken with thoroughness whilst it is occupied with bushes or trees. Can you not take

it piecemeal fashion whilst clear of nursery stock, cultivating the vacant plots with digging forks, and going deep enough to extract all of the roots of the Couch Grass, throwing these on to the surface to dry, and then burning them in small heaps, or wheeling them into big heaps to be rotted? The hoe must do the rest, never letting a top remain. It would be advisable after digging to cleau the laud with the fork or the Kentish-hoe (three-tined) several times, and then crop it with Flax or Potatos, Jerusalem Artichokes, or any crop that would permit of the free use of the hoe during the season of growth. We greatly doubt if the gaslime suggested could be used as a destroyer without your having to use so much that the land would be "poisoned" for years.

Fungus in Church Wall: T. Winter. It is the ordinary "dry rot," Merulius lacrymans, which could only thrive with plenty of damp, and originated from timber somewhere. There is no chance of destroying it except by clearing out all the timber affected, and putting in new, thoroughly kyanized or saturated with creasote. M. C. C.

Grapes Diseased: A. R. The berries sent, show the commencement of an attack of "spot," Gleosporium leticolor. The conditions of the roots baye nothing whatever to do with the attack, as the fruit of Viues in the best of health are not immuue, nor are the worst cultivated specially disposed to au attack of the fungus. Where the fruit has suffered the previous year it is prudent to use any of the usual remedies, such as the Bordeaux Mixture, sulphur on the hot-water pipes, in the whitewash used on the walls, and mixed with water and kept in broad saucers about the house. The so-called mildew antidotes sold by florists and nurserymen should also be used. These remedies should be used from the time of starting the Vines. There is no known cure, but great care should be taken to remove all affected berries as soon as seen, and to burn them.

INSECTS: C. Candy. The insects in earthen cells in the Strawberry bed are in all probability the pupa of the cockchafer or May-bug, which, of course, is highly injurious.—K. Z. The grub infesting the Parsnips was squashed and utterly unrecognisable. $R.\ McL.$

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—W. D. 1, Picea sitchensis; 2, following number.—W. D. 1, Pieca sitchensis: 2, Juniperus Virginiana var.; 3, Pinus Lambertana; 4, Abies brachyphylla: 5, Pseudotsuga, Pouglasi, glauca; 6, Pieca excelsa var. Clambrassiliana.—P. J. Campanula caspitosa, alias C. pumila, alias C. pusilla.—W. J. P. 1, Taxodum distichum; 2. Digitalis lutea; 3, Hemerocallis fulva, double.—S. W. H. 1, Achillea ptarmica; 2, Nepeta violacea; 3, Sidaleea malvæflora; 4, Origanum vulgare; 5, Armeria maritima: 6, Sedum oppositifolium; 7, Arabis albida probably, but there are no flowers.—I. S. Two varieties of Oncidium luridum guttatum.—H. H. Lielia crispa, often erroneously called Cattleya crispa in gardens.—W. H. J. Yours is a very good example of what is called Lælia purpurata Brysiana.—S. W. Why W. H. J. Yours is a very good example of what is called Lælia purpurata Brysiana.—S. W. Why ask the Publisher about such matters? 1, Hoffmannia (Campylobotrys) regalis; 2, Fittonia argyroneura; 3, Cheilanthes leudigera; 4, Lysimaehia thyrsiflora; 5. Polemouium cœruleum; 6. Flowers all falleu—an Acouite (poisonous).—W. T., Leicester. Ginkgo biloba (Maidenhair tree), and Euphorbia Lathyris (Caper Spurge).—J. C., Aberdeen. The seeds sent are those of the new African Cypress, Widdringtonia Whytei, of which meution has frequently been made in the Gardeners' Chroniele, Greenhouse treatment will be required, - C. W. D. Bromus mollis.—J. Moore. May be Hoya globulosa, but without leaves, we cannot be certain. - F. B. The specimens are too scrappy for identification. J. A. Stanhopea eburnea.—L. L. 1, Campanula garganica; 2, Rondeletia odorata, 3, Galega officinalis var. alba; 4, Adiantum Pacotti; 5, Oneidium; 6, Asparagus tenuissimus.

SPUNO: Otto Armbrecht. We are unacquainted with the preparation, and cannot, therefore, answer your question.

VIOLAS, AND SINGLE-FLOWERED PINES: J. F. Desirable varieties.

Friday, July 31, 1896.

GREAT MIDSUMMER SALE.

Immense numbers of new importations of grand ORCHIDS, just to hand, in the finest possible condition.

2000 CATTLEYA AUREA, with the Imperialis form of CATTLEYA GIGAS, the gigantic purple-crimson type, of which C. Sanderiana is a form; together with the large incomparable CATTLEYA AUREA CHRYSOTONA, the ne plus ultra of the genus. Extract from collectors letter:—"I hope, gentlemen, you will receive the consignment in good order. It will consist of more than 2000 plants (gigss imperialis and aurea). As I told you in my last letter, the boxes will leave here in order to catch the first steamer. These Cattleyas have been collected in the region where aurea and gigas come together; the white aurea and gigas of Senor Andreas were also from here; they have cost him heavy. My porone have sketches stained on a smooth kind of bark, equal if not finer than Hardyaua, Oweniana, Countess of Derby, &c., and they were the least surprised when I showed drawings of these fine kinds, and remarked, 'We have brought you finer than these in our baskets, senor.'" All are offered as received.

CATTLEYA GASKELLIANA.—This is our own discovery

finer than these in our baskets, senor." All are offered as received.

CATLEYA GASKELLIANA. — This is our own discovery and our own intraduction, and a finer let of plants has never been imported since we first brought this superh species to Europe; larger masses we have had, but never such a remarkable and beautiful lot. It is the freest flowering and freest growing of all the Cattleyas. The original noble broad-petalled large flowered type has become exceedingly rare, and we are only able to offer eighty plants, but they are magnificent in every way. It is impossible to obtain finer. The bulbs are plump, the eyes dormant and the leaves firm, evidencing their unniqued vitality. Grand varieties will be among the plants offered, such as the Duke of Marlborough's, C. G. alba gigantea, Madoux's var., C. G. auren, &c., which for size, substance and beauty are far away finer than the comparatively small summer-flowering labiata Gaskelliana, now generally found in commerce. In the collections of Sir Trevor Lawrence, the President of the Royal Horticultral Society, Baron Schroder, Lord Rothschild, and our merchant princes in London and the Provinces, are superh forms, but they are of the original type, and from the same woods as those now offered.

DENDROBIUM DEAREL.—The white bouquet-flowered Den-

in London and the Provinces, are superh forms, but they are of the original type, and from the same woods as those now offered.

DENDROBIUM DEAREL.—The white bouquet-flowered Dendrobe Pearly white, nearly everlasting flowers, with green centres, illustrating the Saxon colours. Enormous importation, in superb condition, just ready to make new growths. The finest time for establishing this plant is now. Flowers last three month in perfection. A more exqusitely beautiful pure white Orchid it is impossible to conceive. Its great bunches of bloom crown the tops of the leafy green shoots. This plant grows freely in a plant-stove, and flourishes with the treatment accorded to stove-flowering plants. No collection should be without it.

ZYGOPETALUM VENUSTUM, new species (Ridley), never previously introduced, and not known in cultivation—quite dietinet from all known Zygopetalums. Obtained from the banks of the Kookenam River. Flowers of medium size, horne ten or more on erect spikes, pure waxy white, the base of the lip stained with yellow; apex and face of column streaked with purple.

Also rare, interesting, curious, fascinating, weird, mimical, attractive, exquisite, delightful, charming, and gem-like ORCHIDS, including The Gost, Parson in Pulpit, Moon Orchid, Sad Orchid, Bull's-mouth Orchid, Old Man Orchid, Javann Star-bearing Orchid, Anchor Orchid, Pig-snout Orchid, Pug-nosed Orchid, Trumpeter Goblin Orchid, Flying-dove Orchid, Lizard-headed Orchid, SELL, the foregoing grand ORCHIDS at their Central Mann of the foregoing grand ORCHIDS at their Central Mann of the foregoing grand ORCHIDS at their Central Mann of the foregoing grand ORCHIDS at their Central Mann of the foregoing grand ORCHIDS at their Central Manner of the foregoing grand ORCHIDS at their Central Central the foregoing grand ORCHIDS at their Central Manner of the foregoing grand ORCHIDS at their Central Manner of the foregoing grand ORCHIDS at their Central Centra

MESSRS. PROTHEROE AND MORRIS will SELL the foregoing grand ORCHIDS at their Central Auction Rooms, 67 and 68, Cheapside, R.C., on FRIDAY NEXT, July 31, at half-past 12 o'Clock, by order of Messrs. F. Sander & Co., St. Alhans.

Marsh, Huddersfield.

JOHN BELL, Hon. Sec.

To Nurserymen and Florists commencing Business. HAMPTON-ON-THAMES, on the Marling Park Estate, free from London fogs, a deep rich loam, the favourite neighbourhood for Growers, FREEHOLD LAND for SALE on easy system of Purchase, or to be LET on Lease. For full particulars, apply to Mr. FREDK. G. HUGHES (Surveyor), the Estate Office, Hampton-on-Thames.

TO LET, GENTLEMAN'S HOUSE, Middlesex, under one hour from City, G. W. R., standing in 2; acres: 300 Apple, Pear, and Plum trees, 600 Currante, Raspberries, 20 Vines. Hot and Cold Greenhouses, Fernery, Ornamental Shrubs, Tennis Lawn, 2 Fowl-runs, 2-stalled Stable, Coach-house. Rent, £70. The fruit has made £80 each year the last three years; expenses of gardener and sale of fruit, £30. No trouble to dispose of crop; picked, fetched, and sold.—Address A. P., Gardeners' Chronicle Office, 41, Wellington Street, Strand, London, W.C.

ODONTOGLOSSUM LONDESBOROUGH-IANUM, O. MADRENSE, LÆLIA PEDUNCULARIS, and L. DAYANA. All fine imported plants, in grand condition, 2s. 6d., 3s. 6d., 5s., and 7s. 6d. each.
W. L. LEWIS AND CO., Southgate, London, N.

SPECIMEN GREENHOUSE TREES and PECIMEN GREENHOUSE TREES and PLANTS.—Noblemen or Gentlemen having in their possession Large Trees or Plants that have out-grown their available space, and which they would be willing to present to the New Public Winter Garden, lately completed at Sefton Park, Liverpool, about to be handed over as a gift to the Lord Mayor and Corporation of that city, are requested to communicate with Mr. H. HERBERT, Superintendent of Parks and Gardens, at Liverpool, who is authorised to defray all expenses attending the removal of any accepted plants.

The Plants most desired are the following:—Palms, 15 to 20 feet high; Tree Ferns, with good stems; Bamboos, Acacias, Araucaria excelsa, Rhododendrons, Rucalyptus, Yuccas, &c.

As the building is 70 feet high, and big in proportion, and has beec built by Messys. MACKENZIE & MONCUR, of Edinburgh, with every modern improvement, a happy home will be secured for any Trees or Plants presented as above.

Address, Mr. HENRY HERBERT, Superintendent's Lodge, Sefton Park, Liverpool.

Now is the Time to Sow

If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Re-

mitting is by POST-OFFICE MONEY

ORDĔR.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER

Publishing Office and Office for Advertisements. 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to II. G. COVE.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with

complaint).

NURSERYMEN'S HOUSES.

WORDSLEY, STOURBRIDGE.

MUNGO CHAPMAN, late of Easter Duddingston Lodge, Mid-Lothian, begs to intimate to his friends and acquaintances that he retires from his present cituation on the 20th of the present month. He has arranged to reside at St. Ninians, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the management of one of the most choice private collections of plants to be found in the British Isles—that of the late Charles Jenner, Esq—Mr. Chapman can confidently undertake to anpply what is select and true to name of the most suitable plants for Borders and Rock-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully employed in getting up Stock.

THE

Gardeners' Chronicle.

SATURDAY, JULY 25, 1896.

THE BOTANICAL GARDENS, GLASNEVIN, CO. DUBLIN,

BOTANICAL garden established for over a century in a genial climate, and well planted and kept all that time, may very naturally be looked upon as a most interesting place to plant-lovers any day throughout the year. Personally, I may say that I never visit the place without gaining an insight into some cultural secret, or meeting with some phase of horticultural biology, or with some rare or beautiful species I never saw before. Spring, summer, autumn, and winter, there is ever here —as indeed in all good gardens—something to see and to admire. The only difficulty at Glasnevin is to decide where to begin, or, in other words, what to admire, for the place is 40 acres or so in extent, and the indoor and outdoor departments are many, and richly stored.

The main features are fresh green grassy glades and fine trees and shrubs, the river Tolka winding along the lower side of the arboretum and gardens beneath some noble old Willows, just now very beautiful and leafy in the hot snnshine, but attractive even in winter also, as their golden twigs stand out rich and

mellow against a blue-grey sky.

The old Yew-tree walk (fig. 18, p. 97), which tradition dedicates to Addison, forms a cool and shady retreat on a hot June day, or you may wander down by the water and see the rosy, pink, vellow, and white Water Lilies nestling among the reeds, or see the Japan Iris and Sarracenias, Spiraeas, and Orchids, together with Primula Poissoni a yard high or more in the bog garden.

The rock garden (fig. 22, p. 105) is fresh and bright, and the cool verdure of the hardy Fernery perfect; and the herbaceous borders are gay with bright colours, gay with Poppies and Delphininums, and a host of other summer flowers.

A very fine specimen of the Asafortida (Ferula Narthex) has recently flowered, and its great nmbellate stalks are now bearing a very heavy crop of apparently good and plump seeds. In all its phases this is a robust and effective plant, and well worth culture for its distinct part and stature. I saw several fine plants of this rare Umbellifer a year or two ago, and the effect of its bold glaucous foliage was most effective in proximity to groups of the great scarlet Oriental Poppies then in bloom.

One marked feature at Glasnevin is the culture of rare hardy and half-hardy plants in narrow borders alongside the extensive planthouses. Here is Jaborosa integritolia, dense of eafage, and thick-set with its pure white flowers. The old Tupa Feuillei makes a mass vards across, throwing up its red spires of bloom. In another warm recess are all the hardy Crimums, far stronger and more floriferous than one usually sees them indoors; C. Mooreanum, and the hybrid C. Powelli and their white-flowered forms, are very free and floriferons as so grown, and even when not in bloom their gigantic leafage renders them conspicuous objects. Several of the rare kinds of Alstromeria also grow well on these borders, including the exquisite A. pelegrina alba, and there is a splendid mass or clump of the rare Californian Dicentra chrysantha.

Hot as it is, we cannot resist a peep into the Aquatic-house, gay with Caladia and Achimenes in hanging baskets; and the exquisite tropical Water Lilies and Nelumbia opening their waxy and fragrant flowers. The giant Victoria regia is always a sight here, flowering, as it does, most luxuriantly amongst its great platter-like leaves.

The vivid orange or cinnabar-red Gerbera Jamesoni flowers well on a narrow warm border near this house, and the overflow of warm water from the Victoria tank feeds some open-air receptacles in which the Chinese Water-Chestnut, or Trapa natans, grows and seeds every year. Here also some of Marliae's seedling Nyuphaas are very attractive, producing their soft rose and sulphur flowers.

One especially interesting feature at Glasnevin is the culture of insect-catching plants from all parts of the world. One of the rarest perhaps just at present is Roridula gorgonias, which is like a shrubby Drosera, with attenuate glandular leaves. Here also are healthy plants of the South American Heliamphora, with elegantly vase-shaped urns, the orifices of which have a glistening, satin-like lining of close-set, deflected hairs, which in the sunlight imparts to them a very beautiful effect. This plant flowered here two years ago. There aro Droseras in profusion of many kinds, and the quaint Cephalotus, especially the variety with deeply - coloured pitchers, from King George's Sound; Sarracenias of numerous varieties, many of them being seedlings and hybrids reared at Glasnevin by Mr. Moore, whose special object has been the production of good flowering varieties.

In one of the cool plant-houses at Glasnevin there is just now a very strong and handsome plant of Darlingtonia californica. In all there are at least fifty pitchers of all sizes, the tallest being fully 3 feet in height, and beautifully coloured. As you stoop and look up the dones of the great hooded pitchers they look as if filled with stained glass, or jewels glistening in the sun. As thus seen, luxuriant and healthy, there are but few amongst the so-called "Pitcher-plants" so effective and full of interest.

The true Pitcher-plants, or Nepenthes, are richly represented, and in one of the cool Orchid-houses there is a probably unique specimen of N. Rajah, the giant species from Mt. Kina Balou, in Northern Borneo. This specimen is one of the very few now in existence, it having usually proved to be a most intractable plant under hot-hous enlitvation [see fig. in Gardeners' Chronicle, 1881, p. 493, vol. xvi.] The Glasnevin plant is just forming a very fine and highly-coloured pitcher, and no doubt the largest ever made in European gardens. As seen growing at 8000 to 9000 feet altitude in Borneo, this plant is one of the most remarkable plants in the vegetable world, and Spencer St. John in his Life in the Forests of the Fur East, alludes to his followers using its giant urns as water vessels; while in one enormous pitcher his fellow-traveller, Mr. now Sir Hugh Low, found a drowned rat. Another rare and peculiar pitcher-plant from the Bornean lowlands is also represented here by a fine specimen, viz., Nepenthes brealcarata [see fig. in

Gardeners' Chronicle, 1880, vol. xiii., p. 201]. This plant as found wild, has Vine-like stems, 50 feet long, which scramble up into the 40 or trees or river-side jungle. Its great leathery two-spurred pitchers dangle about among the moss-grown stems and branches, which are copiously infested with myriads of ants, beetles, and other small fry or insect prey. I noticed here also one of the healthiest plants of N. Veitchii I ever saw, bearing five or six of its great hairy urns. This is also a Bornean plant, with a liking for dead trees, on which it is epiphytal, the leaves clasping the trunk so as to assist the roots in holding on to the bark. No doubt the plant gains some advantage by adapting itself to life on dead trunks and branches, rather than on living ones, finding as it does a liberal supply of insect life in such positions.

It seems anomalous not to mention the superb and well-grown collection of Orchids, for which Glasnevin is famous, but they must await a paper to themselves. We have, in fact, but little time for the houses on such a hot day, but could not help noticing a glowing mass of the golden Cassia floribunda, and the soft grey buds swelling on the nightblooming species of Cereus, such as C. grandiflorus and C. MacDonaldiae.

Our all too-short notice of Glasnevin would be incomplete did we not at least mention a few of the shrubs that do so well on its old walls, There is a magnificent example of Fremontia californica, and the Carpenteria, a beautiful first-cousin to the Philadelphus, flowers very freely outside. Then there are all sorts of oldfashioned garden Roses and Fuchsias, and a soft grey bush of the Halimodendron argenteum had its branches entwined with soft rose-purple flowers. This is the "Salt-bush" of the Siberian steppes, and is rarely seen in flower in gardens. It belongs to the Leguminosa, and is sometimes grafted upon the Laburnum as a stock, so as to form a weeping standard instead of a prostrate bush.

As we await the frain from the village on our way to the town, we admired the great Aristolochia Sipho on the gate-lodge or offices, and close heside it noted a healthy and strong companion in the shape of the new Japanese foliage vine, Vitis Coignetie, from Castlewellan.

Now that the tourist so often finds his way to the Emerald Isle, Glasnevin is likely to prove a great attraction to all who, like Cowper, love a garden and a greenhouse too; and the place is so rich and well kept that they will not only enjoy their visit there, but wish to come again. F. W. Burbidge.

NEW OR NOTEWORTHY PLANTS.

CATTLEYA \times SUPER - FORBESI (Forbesi \times superba).

This pretty addition to garden crosses was shown by Mr. J. Cypher, of Queen's Road Nursery, Cheltenham, at the last York Gala, where it received an Award of Merit. The liabit of the plant is similar to that of C. Forbesi, and the general form of the flower also more nearly approaches that species than it does that of the other parent: but in its colour, and in the more expanded side-lobes of the lip, and the firm texture of the flowers, the influence of C. superba seems to predominate. The sepais and petals are of a creamy-white line tinged with rose, with green at the tips. The lip is showy, and ample for its class. The base is yellowish white with the brownish-yellow raised lines, as seen in C. Forbesi, which rediate towards the tips of the side lobes; the latter are beautifully coloured with rose-purple on the inside,

and veined on the outside with the same colour. The front lobe is rose-purple, with the yellow marking in the centre, as seen in C. superba. The column is cream-white, tinged with rose. James O'Brien.

THE ROSARY.

THE NEW RACE OF ROSES: HYBRID TEAS.

HYBRID Teas have been called the "Roses of the future," I should be much disposed to call them the Roses of the present, in accordance with the value very generally placed upon them. They are at once more trustworthy as bloomers, very free-flowering, and highly ornamental, and they are, for the most part, vigorous in growth-a fact emphasised by the dimensions to which such varieties as La France, Caroline Testont, Duchess of Albany, and many others, in a single season will attain. Combining as they do the admirable characteristics of the hybrid perpetuals and the Teas, they have the strength of the former combined with much of the delicacy of the latter; while in fragrance an attribute which should not be ignored—such fine varieties as those I have mentioned have never been surpassed. In this respect, at least, La France is supreme. This Rose, which, in the light of its remarkable beauty and attractiveness, might well be called the queen of tho garden, shining, as she invariably does, among her lustrous contemporaries as the moon among the lesser fires (" Luna inter minores ignes"), was perhaps the finest production of the late M. Guillot, of Lyons; the raiser likewise of Catherine Mermet, Horace Vernet, Madame Bravy (one of the sweetest-scented Tea Roses), Madame Hoste, Madame de Watteville, Madame Falcot, Comtesse de Nadaillae, and Ernest Metz. It is a remarkable fact that Guillot did not know the origin or parentage of La France; as he incidentally mentioned, soon after its appearance, in a conversation with the venerable originator of the National Rose Society, the Rev. H. H. D'Ombrain; but he felt assured that this incomparable variety would perpetuate his name. That prediction has been fulfilled. Perhaps the nearest approach to La France in colour, fragrance, and size of flower, is one of its own offspring, Caroline Testont, which as an autumnal bloomer lhavelearned to regard as even more valuable. The parent Rose has a tendency to deteriorate in autumn; that, at least, is the result of my own observation and experience. Caroline Testout, on the other hand, is finest at that season of the year, though it may be said with truthfulness that trustworthiness is always a notable characteristic of this invaluable variety. Mr. Wm. Paul's Duchess of Albany is a darker La France, possessing similar attributes, but in my own garden somewhat stronger in growth. Danmark, which is also deeper in colour, belongs to the same family, and may be similarly described. I saw it well exhibited by Mr. Paul two years ago at the Temple Show, where also I made the acquaintance for the first time of that fine dark, Clove-perfumed Carnation, Urish Pike, which I have ever since assiduously cultivated here.

Augustine Guinoisseau has been dignified by the name of the "white La France," though it is distinctly shaded with rose. A pure white variation of equally perfect form is an acquisition which, I greatly fear, will never be attained. It is not impossible, but at least highly improbable; for even if Augustino Guinoissean had been a spotlessly white variety, it has neither the fulness nor perfect form of the parent Rose. Gloire Lyonnaise, formerly supposed to belong to the hybrid perpetuals, is now relegated by Mr. B. R. Cant, of Colchester, and other great authorities, to the class of hybrid Teas. This is one of the largest and loveliest of Roses; and though it was acclaimed at the period of its introduction as the "first yellow hybrid perpetual," it has no claim to that distinction; here it is almost an absolute white. At the same time, I think it is a much grander Rose, and more perfect in formation than such yellow varieties of a kindred class as Perle des Jardins, whose anatomy can only be regarded as being lamentably defective. There is not a more beautiful garden Rose in existence than Gloire Lyonnaise.

Among climbing hybrid Teas, none is more meritorious than Cheshunt Hybrid, raised by the late Mr. George Paul in 1873. It is the finest of all companions for Gloire de Dijon. It is vigorous in growth, fascinatingly fragrant, and reliably floriferous. Reine Marie Henriette, a hybrid between Madame Berard and General Jacquenninot, has sometimes been called, by reason of this origin, "the Red Gloire;" but the relationship is, to my mind, as distant as the resemblance, most of its attributes, with the single exception, perhaps, of the climbing tendency, being derived from the venerable French hybrid perpetual to which I have just referred.

Rarely is the law of variation in favour of a Rose. Souvenir d'un Ami, for example, is surpassed by Souvenir de S. A. Prince, though the former is one of the finest of the older Teas; and in the adjoining department of hybrid Tea Roses, White Lady similarly eclipses, unless, indeed, in fulness, her august parent,

Lady Mary Fitzwilliam.

A variety of greater substance than the latter beautiful Rose, and, therefore, more enduring, is Kaiserin Augusta Victoria, noblest of all Tentonic creations, raised by Lambert & Reiter in 1891. Among recent French contributions to the family of hybrid Teas are La Fraicheur, for which we are indebted to Messrs. Pernet & Ducher; light carmine-rose in colour, with long, graceful buds, expanding into impressive blooms. Gustave Regis, very beautiful in bud, but a veritable abortion when fully blown; Madame Pernet Ducher, which is exquisite in every stage of its evolution, though not very full; and Charlotte Gillemot, ivery-white in colour, and artistically formed—raised by Guillot in 1894.

From Messrs, Alexander Dickson & Sons, of Newtownards, have come two hybrid Teas; (1) Mrs. W. J. Grant, of whose great merit I need say nothing, as it has been awarded the Gold Medal of the National Roso Society, and which unites the dignity of Lady Mary Fitzwilliam with the distinctive fragrance of La France; and (2) Marjorie, said to be a variety of considerable promise, but of whose qualifications I am as yet incompetent to write, as, owing to the sultriness of the early summer, it has taken a long time to establish itself in my garden, declining to grow until the arrival of the recent rains, when it began to develop its latent capabilities with gratifying activity. It is, I learn, an excellent Rose for garden decoration, with a character and complexion somewhat resembling those of the Hon. Edith Gifford.

Of English Hybrid Teas, three of the most valuable are Viscountess Folkestone, Grace Darling, and Clara Watson, all of which were originated by the late Mr. Bennet of Shepperton. Clara Watson was introduced into cultivation by the famous raiser of that loveliest of pure white Tea Roses, Souvenir de S. A. Prince, the late Mr. G. Prince of Oxford. David R. Williamson.

LONDON PARKS.

FINSBURY,-This is well worth a visit in May and early June, to see the tender green of the young leaves of the Planes, Limes, and other trees in the avenues and groups; the different coloured Thorns, Laburnums, the Bird-Cherry, Lilacs, Gueldres-Roses, Weigelas, and Berberis Wallichiana. Rhododendron Cynthea, and other flowering trees and shrubs, give colour as well as verdure with no sparing hand. A few white Spanish Brooms were as graceful as they were chaste, but I could not find the golden Spanish; nor a single common Broom, the grandest of them all. The common white Lilae and the purple Persian were conspicuous for their beauty. A few late Tulips and double Narciss remained of the bulb harvest; Pansies and Violas, Polyanthuses, &c., were also hastening on to supply the missing links of colour, while the usual bedding plants were as yet unplanted. But the most striking floral feature at Finsbury Park was the profuse and skilful use of a threefold cord of beauty of the simplest description. This consisted of two Wallflowers of contrasting colours - one a brilliant yellow, grown as the German dwarf; the other a dark crimson, of about the same height as dwarf Tom Thumb. Associated with these in great numbers in beds and borders was the wood Forget-me-Not, Myosotis sylvatica. The three go well together; though as to the latter, the large variety of Myosotis dissitifiora major, which I did not see in any of the London parks this May, is richer in tint, and bettex.

Repeats of this threefold cord of colour began at the main entrance-gate, and ran through most of the floral parts of this beautiful park. Two points more of considerable practical interest were noted: one was the very hard or severe pruning of the large beds of dwarf Roses-almost cut to the ground; the other was that in the remnants of Tulips, Bluebells, Narcissus, Daffodils, &c., on the grass near to the chief group of flower-beds, Wallflowers, Polyanthuses, and Forget-me Nots have been mixed with the bulbs. This scens almost a new departure which might be carried further, through the use of Aralias, Aubrietias, Saxifrages, dwarf Phloxes, Lily of the Valley, &c. Can one say why the latter which mostly blooms carly in May, is not used in the London parks? Some annuals, such as the Virginia Stock-Malcomia maritima, especially when the white and pink are kept separate, form charming ground-work plants in bulb-

LORDSHIP AND CLISSOLD PARKS.

These are on the other side of the road, on one's way back to the City from Finsbury Park, viii Newington Green. They join each other, are richly wooded, and furnished with excellent roads. The belt of trees of very considerable age against the street casts a most useful shade over the main road in the park on a hot day. There are also fine trees in these parks, and this comparatively rich hoon—they were opened about three years ago—seem greatly appreciated by residents in the neighbourhood, some of whom seem afraid lest these parks should become excessively gardenised. At present the babies, the nursemaids, and the general public seem equally at home and happy in these fine parks. D. T. F.

BELGIUM.

HORTICULTURE ROUND ANTWERP.

M. FLORENT PAUWELS' houses now contain some Anthuriums of great beauty, there being among them well-flowered specimens of A. Dr. G. Jorissen, roseum superbum, Andreanum, Ed. Pynaert, Pauwelsianum (a seedling from Veitchi, and with a leaf nearly as large), Dr. Gravis, an exceptionally bright coloured variety, the spadux drooping, garnet, reproductive organs yellowish white; Louis Fournier, highly scented; grandiflorum, and other varieties. Among the Authorium Rothschildianum mention should be made of the variety Lecraar de Beucker.

The cultivation of Codiarums (Crotons) is extensive here. I noted C. Reidi, anectonense, Queen Victoria. Hanburyanum, Disraeli, and others, with finelycoloured foliage. Orchids are largely grown. In good flower were Cattleya Schilleriana, with a large bloom nicely coloured, especially about the lip; C. Mossie, Phalonopsisamabilis, cornu-cervi, and Luddemanniana; numerous Cypripediums, including C. Stonei, and good varieties of C. Veitchi: Mormodes citrinum, Acricles snavissimum, with two long floral racemes, and one in bud : two Odontoglossum citrosum album, pure white, and O. citrosum, with forty four blooms; Phajus Humbloti, with five trusses, Thunia Bensona. Bra-sia verueosa, Anguloa uniflora, masses of Odontoglossum erispum, a pretty variety of Lycaste plana, Brassavola fragrans, quantities of Epidendrum vitellinum majus and O. Rossi majus, all in fine condition and blooming well.

Caladiums receive much attention, the specimens are sturdy, the leafage fine tone leaf measured about 3 feet wide by $4\frac{1}{2}$ feet longs, and colouring good. Maranta, Alocasia, and other plants are creditable to their cultivator, M. Louis Henneghien. M. Pauwels has a beautiful resary now in full bearing.

At Merxeur MM, Janssens & Co. have a large establishment, in which three houses are devoted to Orchids, and hundreds of Odontoglossum crispum are now in flower there; eleven houses are full of Palms, Phœnix, Latania, Coryoha, and Kentia.

At Berchem, M. Guill. De Bosschère has a charming establishment where are some fine Cattleya Mossie, good varieties of Lælia purpurata, and Masdevallia Harryana with eighteen flowers and in a pot 4 inches across.

HORTICULTURAL MEETING AT GHENT.

Certificates of Merit par acclamation were awarded for: - Cattleva Mossia alba Excelsior, flowers large, petals broad, lip pure white, the throat only lightly tinged with pale yellow; Lacho-Cattleya Hippolyta (L. cinnabarina - C. Mossie), very distinct in colour, sepals and petals orange, lip bright cerise; these Orchids were from M. Jules Hye, M. L. De Smet-Duvivier showed a Croton, Madame De Smet Duvivier, leafage broad, slightly undulated, variegated with yellow, red, and green, a plant of good habit and very effective. The Société Horticole Cantoise sent a fine Vriesea Wartelli, imported from Venezuela, an improvement upon V. splendens major, the spike is larger and broader, the bracts are a brighter red. M. Pynaert staged Adiantum macrophyllum var. striatum, a good Fern for grouping, the young fronds are rose, streaked with white, the old leaves green, striped with white, a variety which tufts freely.

Certificates of Merit were awarded for : Amorphophallus campanulatus, from M. L. De Smet Duvivier, a curious plant, with a very large petiole, surmounted by a leaf, forming a crown; it is distinct from A. Rivieri by the leaf-petiole, which is covered with numerous white marks (they are black in A. Rivieri) Bentinckia nicobarica, a hot-house Palm, with large wide leaves, not much cut, thick in consistency, and a beautiful emerald-green colour, sent by M. Petrick; Begonia Gloire de Gandbrugge, from MM. Vermacreke et Cie., with a bloom 11 inches by nearly 8 inches across, of good form, but rather pale rosecolour; Cattleya Gaskelliana alba par rappel) and C. Schilleriana, with dull brown sepals and petals, the lip handsomely streaked with violet and white, and like that of Zygopetalum Mackaii; these two Orchids came from M. J. Hye. The some exhibitor showed four Orchids remarkable for their flowers: Oneidium macranthum hastiferum, with forty large flowers, yellow with a white lip; Cypripedium Voitehii, with fifteen blooms; C. Charles Canham, with twenty well-opened flowers; and Cattleya Mossiæ alba Wagneri, a splendid specimen as regards bealth, cultivation, and flowers, of which it bears eighteen. Aralia leptophylla and A. elegantissima, from M. L. De Smet Duvivier, are specimens about 3 feet high, furnished down to the pot, and well grown, Ch. de B.

FLORISTS' FLOWERS.

THE CARNATIONS AT WARREN HOUSE, HAVES.

MR. MARIIN R. SMITH is now so well known as a raiser of new Carnations, that it will not surprise those who have some aquaintance with the work he is doing, to be told that this season he has surpassed all his previous efforts in the production of new Carnations. The seedlings of last year grown to be tested this year are so numerous that it required three hours to examine their carefully. And it was a pleasure indeed to spend three hours discussing the relative merits of these new Carnations with their enthusiastic raiser. Three large span-roofed greenhouses contain the plants, and here one may be met with the remark, "Why grow border Carnations in a greenhouse" It is a pertinent question, and is easily answered. The plants are grown out of doors in the open border, as well as under glass; but if Carnations are to be seen grown to perfection it is impossible to be sore that this can be attained in the open border. Heavy rain one day, scorching sunshine

the next, earwigs swing the petals through before the flowers are half open by night, and thrips sucking the substance out of them in the bud-state by day. The gardener cannot combat with these things, unless he has his plants fairly under control. In a glass structure, tobacco-smoke speedily settles all insect-pests, and it does not injure even the fully-open flowers. The gardener with a good lamp at night finds the earwigs feeding, and speedily disposes of them with the other items. "But what a bother!" exclaims some would-be Carnation grower. "Are the flowers worth it?" On this point there is certainly room for difference of opinion. My own views are very decided. If a Carnation fancier is not prepared to treat his plants well, he does not deserve to have them.

The Carnations at Hayes are most carefully tended, and the production of new varieties has been reduced to a science, with the result that a revolution has been effected, and the old varieties in all the classes are being steadily superseded. As a result of careful selection, I noted the following as the best:-Endymion, a large, handsome, well-formed variety, of a salmon-pink colour, the petals exquisitely formed; The Cadi, fine rich scarlet, medium-sized flowers, of superb quality. Haidée: this is the best variety of what has been termed the heliotrope colours; it is best described as a purplish-manve. Lady Hindlip has large, full, crimson-searlet coloured flowers, of good form and petal. Cinnamon: this variety is best described as of the colour of the aromatic bark from which it derives its name; the petals are of good form, and the plant of vigorous growth. I noted five yellow selfs, all good: Miss Willmott is a fine clear yellow, of good form and quality; Eurgess, a full flower, and good yellow : Sir Isaac, lemon yellow, fine form; Saul, a fine large flower, clear yellow, good form, and free grower; and Paragon, large and full, fine yellow, and not the worst of them. White varieties were most promising in the seed-beds last year; some of them still stand to their first maiden promise of excellence. If they surpass Mrs. Eric Hambro in parity of the white, and in the almost unsurpassable form they will be gladly welcomed. Erin is very pure, form and quality excellent; Nevis, pure white, large, and of good quality, but not quite up to last year's standard; Titania, pure white, also of fine form : Mrs. Gascoigue, clear pink, flowers of large size; and to say good form is an endless repetition, as none are admitted but such as are of good form. May Yohé, deep reddishpink, large flowers, and very sweet; Regatta, soft pink, very full flowers, and of large size; Kenilworth, rich crimson-scarlet, of super excellent form of flowers and notals: Mrs. Meltae, rich crimson-scarlet, a tallgrowing plant, but flowers very rich and striking; Prince Charlie is of a bright scarlet, with the petals well arranged: York, a fine blush variety, with wellformed flowers; Clio, a distinct pink self, flowers of large size, the plant of rather low growth-good onter petals; Sappho, pink, large full flowers, good petals.

In what amateurs term the Fancy class, for want of a more appropriate name, there are some new types, and improved varieties of the older types. Mr. Benary, of Erfurt, has made a most creditable advance in the production of fancies, the best of these have doubtless been the groundwork of the Hayes fancies. Don Juan, buff heavily splashed purple, large and fine; Zant, white, with a delicate rose flake, scarcely observable, fine, sturdy growth; Dragoman, buff ground, erimson-margin, mediumsized flower; Naseby, light buff-ground, flaked, barred, and margined with violet-purple. Caique and Egham are two varieties quite out of the usual types found amongst seedlings, the ground colour is buff or yellowish-bufl; Egham is marked heavily with crimson. Delila, lightish - buff, deep reddish - crimson edge: Evening Star, fine fancy yellow-ground, with rich purple markings.

Of yellow-ground Picotees there are some good and distinct torms, but the one that stands out full and clear before all others is Mrs. Tremayne; the flowers are large, well-formed, of a good yellow, margined and marked with bright searlet. Badminton, large, good flower, lightly edged scarlet. Hygeia is the

largest of this class; it has immense petals, and is a striking variety. Lord Warden is distinct; the flowers are of a good yellow, the petals edged with rose, like a fine hair. Empress Eugénie, next to Mrs. Tremayne in quality, but distinct, in that it has a medium rose margin; Dervish, palo yellow, very finely margined lilaey-rose; Mohican, large full flowers, clear deep yellow-read edge; Yale, deep yellow ground, with a heavy scarlet margin; Gabrielle, lemon-yellow, edge! rosy-red, good petal and handsome form.

There are others I noted, but the above form a selection of the best of the seedlings. The foundation has been laid of new forms in the flake and bizarre section, and a new departure is urgently needed, as the varieties now in cultivation are many of them of very weakly constitution, and one may not suggest any alteration in the markings, or even in the shade of colour, without being pounced upon as a heretic; but this is a complicated subject from the florist's point of view, and can be best dealt with by the comparison of new types with old.

PELARGONIUM DISEASE.*

WE have received from a correspondent ("D. M.") some stems of Pelargonium for investigation. It is to be regretted that they were packed in cotton-wool, which much increased the difficulties of examination. There is no more objectionable material for packing plants or fungi than cotton-wool. The information furnished is to the following effect:-"I enclose stems of Pelargouium Henry Jacoby, which I have cut from plants which have unaccountably died off. I first noticed this peculiarity or disease amongst a few hundreds of Vesuvius which we had occasion to buy in three years ago. It appeared to extend to our own stock of Vesuvius, and last year some large beds in the flower-garden of Vesuvius and Henry Jacoby were spoiled by a considerable percentage dying off. Trentham Rose showed some trace of the disease in a less degree.

"This year I have almost discarded Vesuvius, but kept some beds of Henry Jacoby, keeping a reserve of plants to make up any vacancies. About seven per cent. of the plants of Henry Jacoby have been attacked, and gone off this year alreally. Some kinds of Pelargonium show no signs of disease; among others, Trentham Pink or Christine, Niphetos, Tom Thumb, Raspail, &c.

"The plant seems to stop growing, and in a few days some of the lower leaves turn yellow; then the stem appears to get black, although the mischief whatever it is, seems to be going on underground before showing above ground. I am burning all infected plants as they are replaced. The kinds Vesuvius, Henry Jacoby, and Trentham Rose, will have to be discontinued here after this season."

The stems sent are decayed and blackened at the base just above the ground, and over these decayed spots are scattered pallid, mealy-looking little patches, not more than a line in diameter, and sometimes with a tinge of flesh colour. These superficial patches may be removed on the point of a pen-knife, and seem to burst through the cuticle. At first they are probably a little gelatinous, but soon become dry and powdery. Under the microscope this exudation is found to consist entirely of long spindle-shaped conidia, curved at each end, and attenuated to a point; when mature they are 60 to 70 micromillimetres long, and about 6 μ in diameter, at first with three, and afterwards five transverse septa, and uucoloured. These particulars indicate the genns Fusarium, but the species is one which we do not think has yet been recorded, and honce may be spoken of as Fusarium Pelargonii, a new species which affects the stems of cultivated Pelargoniums.

As suspected by our correspondent, this would seem to be an endophyte, which makes itself evident in the tissues before it breaks through the surface, and hence is most difficult to influence by the use of fungicides. Meanwhile, in order to prevent spreading, the only method is that already pursued of burning all diseased plants.

Naturally the question arises whether this specific mould is the cause or consequence of the diseased tissues. Although many of the species of Fusarium are saprophytes, and grow only upon decayed matter, others are undoubted parasites, and cause much mischief. Although the evidence is not entirely conclusive, we are of opinion that Fusarium Pelargonii (Cooke) is the cause of this disease, which we have never met with before, but has the capability of being very destructive. M. C. C.

FRANCE.

EXHIBITION OF THE SOCIÉTÉ CENTRALE D'HORTICULTURE OF NANCY.

Part of this exhibition was held under teuts, where were greenhouse plants and cut flowers; in the open were plantations and beds; it was organised in the town park of the Pépinière. Among the most interesting exhibits were some unnamed seedlings of double tuberous Begonias from M. Creusse. Among the noteworthy Orchids were:—Odontoglossum Pescatorei var., with the lip handsomely spotted, and the tip of each division striped with purple; Phains Humbloti var. carmineus, very distinct; Cattleya granulata dn Buyssoni, with a large well-coloured bloom; and C. Warscewiczi.

MM. Victor Lemoine et fils staged some cut blooms of Delphinium, Ceanothus, Potentilla, Gladiolus, Syringa japonica, Rhus Cotinus atro-purpurea, and a series of novelties, among them Lenicera Morrowii, Plypericum densidorum, Olearia Haastii, Begonia flamboyant, Primula Poissoni, Spiræa Bumalda Anthony Waterer and ruberrima, Cuphea Llavæ, Russellia intermedia (R. junceo × sarmentosa), and Ligustrum Walkeri.

M. Léon Simon showed a good collection of trees, shrubs, and herbaceous plants from the nursery of Simon Louis Frères, at Plantières, near Metz.

There were some good floral decorations and ornamental groups from M. Blaison Forêt and M. A. Grandjean. Cut Roses from MM. Soupert & Notting, Lamesch, Crousse, and Müller were well selected; zonal Pelargoniums (both single and double-flowered), Fuchsias, &c., were effectively bedded out, as were large flowered Camas.

Every day during the exhibition an open conference was held for the visitors, while on one day the members of the Society convened a conference to debate on the popular cultivation of plants. Ch. De B.

FORESTRY.

DROUGHT AND NEWLY-PLANTED TREES.

In a season like this, when all vegetation is, or has been, suffering more or less from insufficient moisture in air and soil, we are often surprised to find trees and shrubs standing the weather better on light and naturally dry soils than on stiff and heavy ground The explanation of this is simple enough, when we consider the mechanical condition of soils, and their behaviour under different climatic conditions. In dry weather, adhesive soils, such as clays and marls contract, leaving cracks and fissures in the soil which allow the drought to be felt to a considerable depth, and this contraction exerts an injurious tension on tho roots of plants near the surface. Light soils, on the other hand, have no such adhesive or contractive property, and their mechanical condition varies little. whether the weather be wet or dry. When once the upper 2 or 3 inches of a sandy soil have become dry, its further drying is a slow process, providing it is not stirred or moved so as to destroy capillarity. Of course, this only holds good on soils of a fair depth, such as deep beds of sand or light loam. On very shallow soils overlying solid rock of a non-absorbent nature, drought of even a short duration soon

Fautrion Pelargova, Cooke.—Sporodochia sessile, discoid, eireular, or hemispherical, confluent or irregular, pallid, gregarious, conidit fusiform, curved and pointed at each extremity, eto isophate, hyaline, 60 to 70 by 6μ . On decaying stems of cultivated Felangonium. Sutherland.

makes itself felt; the more so when the climate is generally moist, and the plants unaccustomed to dry periods.

Under natural conditions, such as exist in thick forests, drought has comparatively little influence upon vegetation so far as the condition of the soil goes, and it is principally through the atmosphere that its effects are felt. In such forests, various cau es combine to render the trees independent of those frequent summer rains which are necessary to keep grass and other shallow-rooting plants fresh and green. In the first place, the deep root system of trees brings their roots in touch with soil which is comparatively unaffected by an ordinary spell of dry weather. But the most important factor in preserving the soil-moisture is the humus layer which covers the ground in all thick woods, and which acts as a mulch and a fertiliser at the same time.

normal condition until fresh rootlets have pushed into the surrounding soil, and are carrying on their proper functions. Hence, all these transplanted in the ordinary way should be well established by the month of March on all dry soils, if they are to be safe against spring drought. The condition of the soil has already been referred to, but this may be greatly modified by preparation of the ground and methods of plinting. On all stiff soils, the best results are obtained when pits for the plants are dug some months previous to planting, so as to thoroughly acrate and pulverise the soil before the roots are put into it. When so treated, the soil is less subject to cracking, and if planting is done when it is dry and friable, as should always be the case, little fear need be felt regarding the future. A frequent cause of failure on such soils is planting by the slit-system, and treading the soil firmly aroun l THE LARCH DISEASE.

You were good enough to publish a few observations I sent you on this subject in your issue of April 4 last. My views, although those of an amateur arboriculturist, comprised theories founded on a long experience among woods and plantations, and I may say it was for the purpose of eliciting further information from practical foresters that I ventured to address you on this important question; but, with the exception of a few desultory remarks from time to time, and at length a summary, as he calls it, of what had been said by your Banffshire correspondent, nothing has emerged of any importance, or calling for reply.

What 1 maintain is, that no one who has studied animal and vegetable physiology can deny that any kind of tree which is not indigenous to this country requires careful treatment in its propagation and

Fig. 16.—View in the royal botyne al garden, glasheven, with ecconnects monument. (See P. 89.)

This layer prevents any cracks being formed in heavy soil and evaporation from the surface, and retains any rain which falls in thunder-showers, which, on hard, dry ground, usually runs off without doing much good.

It is chiefly in young plantations, however, that drought gives the forester any anxiety, especially the first summer after planting, and it is not uncommon to see a few weeks' dry weather in spring kill a large percentage of newly-planted trees. How far the drought alone is responsible for their death, we do not pretend to say in all cases, but assuming that the trees were perfectly healthy when planted, and the roots uninjured by exposure, their death is usually attributable to one or more of the following causes-late planting, unhealthy condition of the soil, and the presence of a thick matted turf. Late planting is chiefly injurious to coniferous or evergreen plants, but affects all kinds when hot sun and drying winds arrive before the roots are in a proper condition for taking up moisture. Unless moved with a ball of earth, or transplanted with uncommon care and despatch, no transplanted tree returns to its the plants. In such a case, the latter are practically enclosed in a brick-like mass when dry weather setin, and growth becomes an impossibility. In the third cause of failure -a matted turf-the plants simply die of starvation. This chiefly happens on dry soils when the trees are slit-planted, and where the roots of the turfare in possession of the uppermost layer of soil. The most of the plants being in or immediately below this turf, the available moisture and plant-food are too small to carry the trees through the critical stage, and a short spell of dry weather is usually fatal. On such soils it is not uncommon to find plants die the second summer after planting, should this be not and drya clear proof as to the nature of the complaint. On dry, peaty soils, the same thing frequently happens, the only remedy being either pit-planting, or the removal of the fibrous turf or peat before planting, so that the roots are placed in fresh and friable soil. Nothing is better for newly-planted trees than a good mulch of decaying vegetable matter; but except when replanting old woodland, this is difficult to give in ordinary plantations. A. C. Forbes.

cultivation. I have seen the result of planting Lurches in cold wet moorlands, with a hard retentive (almost impervious) subsoil. These plantations became branchy, and productive of cones at an early period of their existence; were, in short, affected with disease of one kind or another long before they were removed, and during the period of their decline men came regularly to gather seed from them for the nurseries. Now as the law of like begets like in both the animal and vegetable kingdoms, we are bound to believe that, notwithstanding the hardihood of the Larix, its constitution has been degenerated by mismanagement, and hence the want of success in growing this valuable tree all over Scotland, at least during the latter and greater part of this century.

On referring to what Brown of Arniston, as he is generally called, says on the subject of Larch diseases, I find he corroborates my conclusions. At pp. 230-81 of the Forestee, he says:—"In collecting the seed of the Larch, great care should be taken not to gather it from diseased trees; nor should it be gathered from trees of a small size, for the very fact of small Larch trees having seed upon them is enough

to point out that they are not of sound constitution. The seed of the Larch, as well as of all other trees, should be gathered from trees of large size, and which are known to be sound. Were this point more attended to, that disease in the Larch termed the rot might in a great measure be in future prevented; for it is well known if the parent be diseased, that the seed of that parent will be in a degree diseased also. Moreover, as the most diseased trees generally bear the greatest quantity of seed, the seed-gatherers who collect it for nurserymen by the bushel will be ready to take it where it is most plentiful, and will pay them best." Again, after deseanting on the rapid growth of the Dunkeld plantations in the latter end of the last century, as well as on the valuable properties of this timber, Mr. Brown goes on to say, that on the advice of the scientists of the day, the Larch was planted extensively in all sorts of soil and situation. According to their opinion, it was one of the hardiest and most easy of culture among our forest trees; and proprietors, relying too implicitly in this matter upon the soundness of these opinions, planted Larch too indiscriminately upon all kinds of soil, without having due respect to the nature of the tree; for the Larch, as well as every other tree, is influenced by a natural law which restricts it to a particular state of soil in order to develop itself fully and perfectly, and from neglect of this the disease, now so prevalent in the Larch has originated. It is well known that, in many instances, whole plantations of Larch trees have died-I may say almost suddenly.'

Your correspondent, Mr. Michie, makes a sweeping assertion in his letter of the 30th ult., viz. :- "I have with great eare dug up trees of different ages quite leprous with blister, and found the roots, the neck of the plant, and a portion of the stem joining the root, quite stout and healthy. It is a very common thing to find the trees producing shoots from the lower part of the stem below the blisters, and these shoots afterwards producing healthy trees, all of which combine to prove that it is not any constitutional defect in the tree which causes this blister, nor because it was raised from seed from diseased trees, &c.," which, being a plain contradiction to almost all I have advanced and can prove to be correct on the subject, I must either leave to more experienced men to respond to, or do so myself at some future period. And yet in the same communication Mr. Michie admits "Frost, combined with dampness, is doubtless destructive to the tree, which indicates that cold soils, cold situations, and cold climates should be avoided, and the opposite conditions carefully chosen and adhered to. Excess of moisture is also fatal to the tree, and must likewise be studiously avoided." Now, really after all is this not nearly admitting all I have been contending for? L. Caputh, 22nd June, 1896.

ORCHID NOTES AND GLEANINGS.

CATTLEYA LABIATA MENDELI "HER MAJESTY."

THE varieties of Cattleya Mendeli, which are so splendidly grown in an adapted fruit-house by F. C. Jacomb, Esq., Cheam Park, Cheam, and which we have previously had occasion to note, have been even finer than usual this season, and the lofty house in which they are grown has been brilliant with their fine flowers for a month past. None that is not considered a good variety is retained, and consequently the species is represented at its best. But among the many fine things which have flowered this season, none is comparable to the noble C. Mendeli Her Majesty, which took the highest award, and was so much admired at the Manchester Royal Botanical Society's Show on May 31, 1895. It seems scarcely possible to conceive a more beautiful Cattleya than this is, for it is excellent in every respect. Its finelyformed flowers have white sepals and petals, delicately tinted with rose, like the tinting of a pearl. The beautiful labellum is white at the base, with a chrome-yellow zone, and an indescribably fine violettinted crimson front lobe; delicate rays of white and purple springing from the base of the lip, and extending to the front lobe.

CATTLEYA GASKELLIANA ALBA.

The differences between the varieties of Cattleva labiata are often more marked by their flowering at different seasons than by any definite variation in the flowers themselves. Such as they are, they are more marked in the albinos than in the forms having normal colours; so much so, indeed, that had the fine flower 1 have received recently from D. B. Rappart, Esq., Liscard, Cheshire, been sent to me a few months later, it would have passed muster as a fine form of the old autumn-flowering labiata. As it is, it requires careful examination to determine that it is not C. Mossie Wagneri, or C. Mendeli alba. But there is the well-known odour of C. labiata Gaskelliana and the characteristic rounded front to the lip, which there is also no mistaking. The flower is of fine shape, pure white, with a clear yellow tinge from the base to the middle of the lip. C. libiata Gaskelliana shares with C. l. autumnalis the reputation of being the easiest Cattleya to grow, and the freest to bloom. J. O'B.

THE SEED TRADE.

The Promise of the Seed Harvest in Lincolnshire: Garden Seeds.—A visit to the districts of Lineolnshire, where seed-growing is a staple occupation, has afforded an opportunity for making a kind of forecast of the probable yield of the various crops. Lincolnshire possesses some advantages over the seed-growing portions, say, of Bedfordshire and Essex—especially those parts of the latter county where the soil is lightest—in that the ground is heavy and retentive of moisture, therefore crops do not so soon suffer from drought; still, most parts of the county have suffered in this way, the effects being, of course, more marked in some parts than others.

Peas are largely grown for picking green and for seed, and it was readily seen that early, mid-season, and late varieties have suffered from lack of rain from the time of sowing to ripening, and especially is it true of the late varieties which have strong and very succulent foliage, and which bloomed during the driest and warmest weather. Very large breadths of this variety were observed in some districts, which promise a short yield of seed. In many instances very few pods formed, and the plants are infested with mildew, thrip, and all other insect pests which attack Peas, making them comparatively worthless in some cases, and doubtful if even the return will equal that which was sown. The yield of the early varieties, although small in quantity, is generally of good quality. The quality of the seed of the late Peas depends upon the character of the weather at the time of harvest, and it will not occasion surprise if after so fine and dry a summer the season of harvest should prove a wet and stormy one. Some of second early varieties, such as Harrison's Glory, which is largely grown in Lincolnshire, podded before the hot weather set in, and the return from these promises to be much better than the others.

Broad Beans.—In the ease of Broad Beans, the hot weather ruling at the time of flowering caused the flowers to fall, and the yield therefore cannot be a large one. The plants are generally healthy; the pods short, for the reason above stated; and the quality promises to be good.

Cabbages.—On the other hand, the seed Cabbageplants have kept clean and healthy, and a good seedharvest may be anticipated—that is, about the first week in August.

Carrots. -The Carrot-plant also suffered much from the drought; the growth is very dwarf, and the crops by no means promise well, the dry weather having caused a great deal of waste, many of the plants decaying, and making no yield. The varieties chiefly grown for seeds are the Altrincham, James's Scarlet, and the New Red Intermediate.

Parsley. -The crops of Parsley standing for seed

look fairly well, but like the other plants they are affected by the drought, being stunted in growth.

Beet.—The promise of the seed crop from selected roots is by no means good, it might be termed an indifferent one; and the yield must be very small. Middleton Park Favourite as one of the best of the dwarf crimson-leaved types; and the Covent Garden red, a large type suitable for market, are the two principal varieties grown.

Radish.—This is only partially grown for seed in Lincolnshire, and also only occasionally; what plantations there are for seed promise a very short yield, as owing to the dryness of the soil the plants could have made but little growth after being transplanted.

Turnip.—The choice early garden Turnips, white and yellow, were much blighted, and when threshel ont the crop must be a light one.

Cress is not much grown, and the crop will be a small one.

Mustard.—Very much smaller breadths than usual of Mustard, both white and brown, were sown, owing to the prices realised during the last few years proving unremunerative, and owing to the extreme drought, and in some districts to the prevalence of the Mustard-beetle; the yield from crops now standing must be limited in quantity, the plant of the brown looking even less promising than that of the white, as the beetle devours both leaf and blossom.

Kales and Broccolis show healthy plants, very clean, and promise well for the seed-harvest.

Potatos.—Early varieties, which are much grown in Lincolnshire for market purposes, were dwarf in growth, as a result of the drought, but the haulm was clean and healthy. It is only off the best land, where the Potato is well grown, that anything like a good crop has been realised. The late varieties have suffered much from the drought, and on heavy lands the yield must be an indifferent one. Spare as the crop comparatively is, the prices at present being realised are low. Should a heavy rain set in, a goot deal of super-tuberation may be looked for, and if this should happen, it will be at the expense of quantity and quality. Pisum.

The Gardeners' Chronicle has often had occasion to speak favourably of the publications of the United States Department of Agriculture. It may be remembered that a few weeks ago mention was mad; in these columns of a bulletin on the common crow of the United States, which went to prove that this bird was to be regarded more as the friend of the gardener, the fruit-grower, and the farmer, than as their enemy.

There has just been issued from the Government Printing Office at Washington an interesting and instructive report on the "Jack Rabbits" of the United States. Although over here we are not troubled with a plague of rabbits, yet it may not by uninteresting to English gardeners and fruit growers to read something about the damage done to grain, orchards, erops, &c., in the States by those animals which are known over the Atlantic as "Jack Rabbits." These animals feed almost exclusively on the bark and leaves of shrubs and on herbage. They will eat Buffalo and Grama-grass and Cactus, and are fond of vegetables and Alfalfa, and also of tender bark.

Everyone knows the disastrous results which followed the introduction of the common European rabbit into Australia some thirty years ago, and nowhere have the methods of destroying rabbits and protecting crops been so carefully investigated as on that continent. While the old-world rabbit belong a to an entirely different species from the jack rabbit of the West, and differs from them in habits, some of the Australiam methods, it is thought, might be used with advantage in the States, where the damage done to crops by rabbits has been illustrated very forcibly during recent years by the losses sustained by farmers and orchardists in the arid regions of the West through the depredations of the large native hares, or jack rabbits. The introduction of irrigi-

tion and the cultivation of large tracts of land have favoured the increase of rabbits in several States by furnishing a new source of food-supply. To such an extent have their depredations increased, that the extermination of jack rabbits has become a serious question in California, Colorade, Idaho, Oregon, and Utah. Dr. Palmer gives a general account of the distribution and habits of the various species of rabbits found in the United States; he shows the methods which have been used to exterminate the animals, and to protect crops from their depredations. Finally, he brings together facts and figures concerning the economic uses of rabbits in general, for the purpose of indicating how the native species may be more generally utilised.

The fact that the large ears of the jack rabbits resemble those of the well-known pack animal of the West, has suggested the common names of "jackass hares," "jack rabbits," or "jacks." In some parts of California jack rabbits are called "narrow-gauge mules" and "small mules," but these absurd terms are not likely to come into general use. It may be interesting briefly to sum up the contents of the report:—

The cost of properly protecting orchards and Vines is often a large item in the expense of setting a new orchard or vineyard.

In Southern California, experience has shown that a fence about 2 feet high affords ample protection, and many orchards are surrounded by lath fences 2 to 2k feet in height.

In other districts, higher fences have had to be built, and barbed wire extensively used.

Where the expense of fencing is too great, young trees have been protected by wrapping the stems with strips of burlap, ganny sacking, or coarse cloth, an inch or two wide.

Some orchardists advocate painting the trunks of the trees with mixtures distasteful to rabbits.

Whitewashing is said to prove effective in some cases, particularly if a mixture of glue and copperas be added to the solution.

Too much reliance cannot, however, be placed on smearing the trunks of trees.

The various species of jack rabbit are all more or less alike in habits, and all feed largely on bark and herbage. When food is easily obtained, and particularly on newly-cultivated land, the rabbits increase rapidly, and do great damage to crops. The black-tailed species are more gregarious than the prairie hare, and, as a rule, are more destructive. In Modoc county, in the northern part of the State of California, nearly 25,000 jack rabbits were said to have been killed in three months, on a tract of land only 6 by 8 miles in extent; this being during the period when the county law was in force. On a ranche in the San Joaquin Valley, about 8000 rabbits were killed in nine days. It will be seen that jack rabbits have a pretty tenacious hold on life when it is stated that Ada County, Idaho, which has been systematically killing off the jacks for fifteen years under the county system, received more scalps and expended more money for this purpose during 1895 than in any year since the county law first went into effect in 1878.

The best means of protecting crops from the attacks of rabbits, and, in fact, the only method which can be relied on, is the use of rabbit-proof fences. Under favourable circumstances, great numbers of jack rabbits may be killed by drives or large hunts; but this means of destruction will only serve to reduce their numbers, and cannot be used to exterminate the pests. Bounties are of little use, and the extermination of rabbits can only be accomplished by eo-operation on the part of individuals. Commercial utilisation is the most promising and least expensive method of keeping these pests in check in localities where they are unusually abundant; but returns from this source will only partially offset the losses sustained on account of injuries to erops. Jack rabbits may be used for coursing, for their skins, or for food.

In America, the rabbit question never has, and probably never will, assume the proportions it has

assumed in Australia. The jack rabbits of the United States are all indigenous species, and ordinarily are held in check by natural enemies and by disease. Although local conditions may sometimes favour their temporary increase, yet natural agencies, aided by the persistent and constantly-increasing war of externination, are gradually, but none the less surely, diminishing their numbers. Herbert C. Fyfe.

CHESHIRE NOTES.—L

ASHFORD, ALDERLEY EDGE. -Ashford is a fine old residential mansion of Gothic character, with numerous pedimented roofs and black and white enrichments. standing in the midst of a wooded park, and led up to by a fine beechen avenue, entering from the public road between Wilmslow and Alderley Edge. The Beeches are getting up towards their prime, and formed in the month of June, when my visit was made, a splendid leafy areade, as one moved along from the entrance, in a fine sweeping curve, towards the house. This has been quite a record year all over the country for the profusion of flowers on all species of "Thorns," and the gaiety of the crimson and pink blended charmingly and most effectively with the white of the common Hawthern, Nor did the Horse-Chestnuts lack of crops of blossom, which together about this park made a splendid show, and acted as a florist foil to the greenery of other neighbouring trees, of which there is a good assortment at Ashford. The flower parterre, gay with Rhododendrons, Azaleas, and such-like June flowering-plants, afforded a welcome enrichment to the lawn, so beautifully green in an average year of rainfall, but lacking in verdure now owing to the drought, and in that way lessening the usual intensity of the contrasts of colours. The grounds are well kept; and the whole place, which was a "bit rough" in former years, has been remodelled and beautified by George Shirland Ball, Esq., who has recently bought the property. This gentleman, as some of my readers may be aware, resided at Earl's Court, Bowdon, and founded a collection of Orchids there, among which were many notable things.

The whole of the Orchids have been transferred to Ashford, and new houses erected suitable, according to the idea of their owner, for their culture. The whole of the wood-work consists of varnished teak; the whole of the fittings are either brass or galvanised iron, doing away altogether with paint, and they bear on their face, as one examines details, a substantiality and neatness, which shows that the first cost must have been considerable, but that wear and tear will be practically absent; and the work done looks as if it would last a lifetime. The stages are also of teak, as are the lattice-work laid on the paths. The brickwork is of that fine ruby-red Ruabon brick, which does not easily alter its colour under exposure to the baleful smoke; and then the archways to uphold the stone slabs that make a cover for the staging, are after the style of those in the Stand Hall Cattleya-house, from which Mr. Ball says he took his model. They have the advantage of giving off moisture copiously. There are skeleton stages in all the houses, the stone slabs being covered with charcoal, and then after a 6-inch vacancy stands the teak staging upon which the plants are placed. The necessary work is reduced to a minimum by ample provision of taps and Indiarubber hose, which is made to play not so much upon the plan's as upon the charcoal midway between the stone and the teak staging, and upon the floors themselves. The piping is ample, and the boiler-power therefore never put to too severe a test. The shading is of those chip or lath blinds which are fast coming, and very properly too, into general use for Orchid culture particularly, and the whole to an "old hand" looks as if it had been supervised by a skilful hand.

There are two cool houses, one in which plants of Odontoglossum crispum fill by far the larger part. Each is 27 by 12 feet, with a pathway running up the centre, and the plants are kept well up towards the roof glass. This is always an advantage, as we see here the strong, finely-developed young growths, and these in flower of asting quality. The white O. crispum here very fine, and there are some spotted

and flushed ones that command attention. There is a great variety, and nothing in the flower way is more generally useful. O. Pescatorei was in fine form; as also O. Andersonianum. Plants of O. cirrosum and Epidendrum vitellinum were in fine flower. In this house there were remarked plants of Ledia Dayana, Oncidium macranthum, Cattleva eitrina, &c.

No. 2 house is a show-house, and its temperature is kept on the cool side, and a little less moist, so as to afford longevity to the flowers. Chief among the novelties in flower were Dendrobium atro-violaceum, a plant after the way of D. Veitchianum in habit, and in flower conspicuous for its blackish-purple rayed lip and green and white segments; Cattleya Mendeli and C. Schrodene were represented by specimens in flower, as was O. vexillarium in several varieties. In this cool climate Zygopetalum Gautierii, the boldest looking and best of the Z. Maxillare section, was growing beautifully in more than one specimen on a Tree-Fern, which was also living and sending out fronds. This state of life for an epiphytical Orchid may have something to do with the remarkable exuberant state of the Z Gautieri.

The Cattleya-house is 27 feet by 14 feet, and is filled with some of the best forms of Cattleyas. That they have improved in this new house was conspicuous to one who had seen them in their old quarters at Bowdon. The climate was particularly agreeable-far more pleasant than under the mid day sun on the day of our visit. Root action is in the meantime, so to speak, rampant, and the young shoots are developing in proportion. A fine lot of C. labiata, and none rarer or better than C. l. alba and C. l. Ballæ, formerly described in the Gardeners' Chronicle. Then there was a fine piece of C. Schrodera alba, a promising plant of C. Gaskelliana alba, also of C. Mossiae alba, several plants of C. Skinneri alba, a valued plant of C. Holfordi, C. Bowringiana, some fine C. Triancei, several Ladia tenebrosa, but singular to say, no Lælia purpurata.

The Cypripedium-house is also 27 feet by 14 feet. The collection is very choice, and of the best kinds. We place at the head of the list C. callosum Sandera, then C. insigne Sanderæ, Lawreneeanum-Hyeanum, a pretty yellowish crest of green, but too stiff and petals incurved—withal a beautiful thing; yenustum Measuresianum, said to be a yellow venustum, C. × Lecanum gigantenm, Rothschildianum, still the best of that division of the species, grande atratum, and lots of others, all doing well.

The Dendrobium-house is a span-roof, lighter than the others, and is constructed for the hanging up of plants, not one above another, but with a clear passage below. The path is 12 feet wide, covered with teak, and what water falls from the plants above gets between the teak openings. This is a capital arrangement. The finer plants are suspended, the commoner herd are placed on stages surrounding the house. Mr. Ball has a very fine assortment of choice Dendrobes, and the collection is very promising. Some grow in pots, some in teak baskets, and some in open potbaskets. The best piece of D, nobile Balli mum we ever saw is here, and it does not show that "miffy" disposition which most of the special variety does. It is evidently a natural hybrid, else there would be no pinkish frayings about the lip--and to boot, nobile is a free grower. D. Wardianum album is pushing strong growth, and it is of the best variety too. There are others here, but the one in question is a "champion." D. nobile giganteum, Stand Hall var., stands at the head of the section, always barring nobilius, an improvement, however, on that variety in form, standing flat, on a plane. D. x Schneiderianum is in several plants, and it is one of the best hybrids; it is a pity that Mr. Holmes, the raiser, cannot reproduce it. D. nobile Amesia is doing well; also D. < Ræbelini, the pelorial D. n. Cooksoni, the D. * Cypherm, D. * melanodiscus, D. * Venus, D. Johnsoni -- a lovely white form, worthy of getting up into specimen size, and one, too, of the most distinct. There are many others which one finds in all collections. So far as we have seen, most growers ean handle Dendrobes, and grow them to please the eye well, but some of our best growers fail at finishing them so as to produce flowers of best quality. Some

evidently winter them too cold, some too hot; the bappy medium would doubtless produce the best results.

There are houses in which flowering plants and Ferns are grown to supply indoor demands. There was a capital show of Grapes in a vinery 30 by 14 feet, in which there is a mixed company of Black Hamburgh, Muscat of Alexandria, and Alicante; the canes strong, the leaves large, stiff, and full of vigour, and the bunches show high promise—all growing in an inside border. The question is, will they last? Melons, Cucumbers, and Tomatos look vigorous and promising.

The place is under the management of Mr. Alexander Hay, who evidently understands his work, and does it very well. That he was appreciated by his fellow gardeners residing about Bowdon there is evidence in a fine barometer that was presented to him, bearing the following inscription, "Presented to Mr. Alexander Hay by the members of the Altrincham Improvement Society, April 8, 1896." J. A.

METHODS OF PROPAGATION.

(Continued from p. 23, July 4.)

Bell-Glass Work—The raising of plants from cuttings is such a simple matter that it is practised with much success by amateurs, professionals, and even the dear old lady, who attributes her good luck to inserting a Barley-corn in the peth (sic) of her cutting to ensure its rooting, and who boasts with pardonable pride that all the plants in her "winder," and in her "garding," too, were raised by herself. Doubtless, she will consider any hints from me entirely superfluous. I am addressing other readers, however, and first, we will take what may be called for distinction, "Bell-glass" work. The great secret of success in this is cleanliness.

The pot or pan, the bell-glass, the soil, the crocks, and the sand, must be specially cleansed and prepared, as well as the cutting. The pot should be a new one, fully porous, but immersed in water a few hours before using it. The bell-glass should be thoroughly washed m soda ley, dried and polished with a leather. The soil mast be mixed according to the kind of plant to be struck, but as a rule peat and loam, with enough sharp Bedford or river-sand to make it porons, is suitable, and some clean dry crocks (potsherds), for drainage, with an admixture of small pieces of charcoal to prevent the mixture souring. The silversand to cover the surface of the soil must be baked before using, this being necessary to kill any spores of moss, or Liverwort (Marchantia), that may be adhering to the granules. Neglect of this may ruin all, as in a short time these minute spores will grow, covering the surface of the sand with the interlacing threads of minute mosses, or the close cellular fronds of the Liverworts. The pats should not be larger than 32's, even 48's are preferable, and the bell-glass should just fit inside the rim of the pot. Let us now prepare some nots. Place over the hole a curved crock, concave side downward, and then on this some smaller ones, and above these a little clean peat fibre, and then add the prepared soil up to within an inch of the pot rim; press firmly and evenly with the bottom of a pot, and then fill up level with the rim with the baked sand, sprinkling the same with water from a fine-rose pot. Stand each on one side until you have a sufficient number ready, and then prepare your cuttings. Being comparatively easy, let us begin with the soft-wooded Heaths (which should be struck about midsummer). such as E. gracilis, hyemalis, cattra, Wilmoreana, regerminans, and persoluta (in variety). Cut off some stout free growth of the current year, and holding it by the base, proceed to trim off their small circular leaves with a pair of sharp seissors from the base up to within 1 inch of the growing point. Cut the cutting with a very sharp knife about 13 inches long, and when you have prepared enough, proceed to dibble them into your propagating-pot. If only a few are required, let them be put in as near the outside of the pot as will allow the bell-glass to be put over without touching them; be careful to close the soil well round them, and finish up neatly and level, finally putting on the bell-glass. Do not water again, but plunge the pot to within an inch of the rim, and shade by a piece of brown paper laid on the knobs of the bell-glasses. Next morning these glasses will be dull from the moisture condensed on the inner surface, therefore lift them one at a time, and wipe each thoroughly dry, and clean, and replace them over your cuttings, shading as before. The third morning proceed similarly, but in addition

using the same compost, but adding a little sifted well-decayed manure. Shade for a few days, and then transfer them into a cooler house, giving light and air freely except in the middle of the day, when the shading should be used. Other Heaths may be raised thus, such as some of the ventricosas, vestitas, and Cavendishii, but they take a little longer to reot. The most difficult are the "tricolor" section; these require lighter soil and a double pot, that is, if the cuttings are put into a 60-pot, this should be stead in

Fig. 17.—Interior of the palm stove, boyal botanical garden, glasnevin, (see p. 89.)

give the cuttings a little water, being careful to avoid wetting the foliage. In less than a month the cuttings will show signs of growth, when they may be allowed a small quantity of fresh air by tilting the glasses on one side, but continuing the shade. The temperature of the plunging-hed should not be less than 60° or 70°, and the house about the same at night, with a slight increase during the day. In from six weeks to two months, all the cuttings will be rooted, when the bell-glasses may be left off, but the shading continued; and in a short time the little plants may be potted into thimbles (smallest 72°s),

a 48 pot, resting on some fine crocks at the bottom, and then the space between the sides of the pots filled in with fine crocks and charcoal, the bell-glass resting on this mixture. The enemies to be fought are damp and rust, both inducing destructive fungoid growth. Only put in one, or at most two, rings of entitings in your 60 ppt, as near the outer rim as possible, and then pile a few pieces of broken charcoal in the centre, covering up closely with a bell-glass. If any rust or mildew shows itself in minute spots on the leaves, put a pinch of flowers-of-sulphur on the charcoal at night; cover up, and remove it in

the morning, when you clean your bell-glass. This may be repeated at intervals of two or three days until all danger has passed.

Among greenhouse plants the Acadas stand prominent, both for their early tlowering, brightness, and grateful fragrance. Such free-growing kinds as A. dealbata and A. Riceana are admirable for covering back-walls or pillars. Many of them are easily raised from cuttings, such as A. armata, A. Drummondi, but the longifolia section are a long while rooting,

Pimeleas should also be grafted in this simple manner, using Pimelea Hendersonii or decussata for the stock. P. spectabilis and P. hispida, two of the best, make next and useful plants thus grafted, but both may be struck from cuttings of the young wood when a heel is taken, though they are a long time about. Many gardeners find a difficulty in striking the variegated Cobsen, a most effective climber for large conservatories and winter guidens, but if they will take the young wood in the spring with a heel, they may

Fig. 18.—Addison's walk—yews, royal botanical garden, glisnevin, (see p. 89.)

but if grafted on young seedlings of A. lophautha, they not only make good plants more rapidly, but flower sooner and more freely. Merely cut the stock half through, the scion likewise, bind together with worsted or cotton, and plunge in a close heat for a few days. Aphelexis and Phoendooma can be struck freely in gentle heat, and soon make good useful plants; but, though the Boronias may also be easily rooted under bell-glasses, they are better grafted upon a stock of B. serrulatt. The deliciously fragrant B. megastigma roots freely treated in the same way as the hard-wooded Heaths.

make sure of 50 per cent, succeeding under a bell-glass.

The Correa does not strike easily, but may be grafted on C. bicolor or C. alba; C.c. adinalis especially, perhaps the most useful and showy of all, should be put on the stock as near the surface of the soil as possible. Among the Cactaceae none are more useful than the winter flowering sections known as Epiphyllum. They all make plants easily from cuttings, but these are more useful for hanging basket work than for stage decoration. To have tall useful plants of them flowering treely from every point, graft them on the

curious Pereskia aculeata, which seems to hold an intermediate place between the leafless t'acti and the Euphorbias. Cut your Pereskia to the height you require, and split down the top joint. Then take a piece of the Epiphyllum -say two or three phyllodes or mock leaves, and place the lower end in the cut of the stock, so that the split pieces may rest on each side of the woody centre of your scion; bind with wick cotton, and keep all close in the double light of your propagating-pit, and in a month a good union will be effected. The most distinct and useful old varieties are Madame Courant, tricolor, violaceum superbum, and Veitch's very levely nevelty, Russelianum Gaertneri, which has flowers almost as large as Cactus speciosus, of a brilliant orange-scarlet colour, which are produced at every point of its gracefullydrouping branches. It grafts easily on Pereskia, and soon makes a good plant.

When we were writing of indoor grafting, a genus of greenhouse shrubs, the Neriums (Oleanders) was omitted. These are known on the Continent as 'Laurier Rose," and in the south make trees and shrubs in the open air. They have been much imp oved by the hybridiser of late years, and now present us with many exceedingly lovely and desirable forms. These are all grafted on the common single-flowered Oleander, either by approach grafting, or by tongue or cleft grafting, merely keeping the worked plants close for a few weeks after working. The most distinct are Madoni grandiflorum (a semi-double white), the Double Pink, and Double White. To bloom them well, give manure-water while growing, and when the buds have set, take care never to allow the soil to get dry; indeed, standing the pots in pans of water is advisable. On the continent, amateurs often raise Oleanders by putting a cut branch in a bottle of water, and then suspending it on a south-wall, adding more water as evaporation takes place. Pleroma and Lasiandra macrantha will root in this manner-by plunging the bottles in the warm tan of the Pine stove.

There remain yet a few plants which should be raised as cuttings under bell-glasses, but which are not difficult subjects. The Australian Milk-worts (Polygala) strike freely if small cuttings of the young wood be taken and inserted in sandy soil under a bell-glass. The same may be said of other pretty winter and early spring flowering plants, the Sollyas, and the Tremandras—one that used to be called "Tetratheca encoides," makes a very graceful table plant, grown in a 60 or 48 pot; while the Heaths of New Holland Epacrids can be increased freely by striking cuttings of the young wood under bell glasses in gentle heat, being careful to avoid getting much water over the foliage till the cuttings have struck.

The criticism of your correspondent, Mr. C. Itoll, in your issue for May 9, had escaped my notice. I do not court a paper war, but would call attention to the fact that I was advising quite an exceptional method of grafting, necessitated by the circumstance that the tree to be grafted was already old and established. If Mr. I, has followed my papers, he will find I do not advocate grafting by the cleft, but I thought it the best way in this case. Experience,

PLANT NOTES.

GAILLARDIA ARISTATA GRANDIFLORA.

Amonost hardy herbaceous plants, the varieties of Gaillardia aristata are great favorrites here, owing to their long-continued flowering and graceful appearance. The flowers last for a long time after being cut, a fact which was illustrated lately by a box of blooms I received through the post from Messis. Kelway, of Langport, which were in good condition a week afterwards. Judging from the collection, great pains have been taken in improving this species, and the colours of the blossoms varied from pure yellow to almost entirely brown, and some of them had the tubular florets of G. Lorenziana, only they are arranged in a single row; and these varieties, if not quite so showy as the others, afford a pleasing variation in form. Plants may be easily raised from seed, which will flower the same season if sown early

on a slight hotbed, and transplanted to the flower-border when large enough. These last for several seasons, except in very severe winters, with but little attention. The plant may be likewise increased by division of the roots. The soil for Gaillardias should be moderately rich and moist, and the position open and sunny. The plant shows to great advantage when situated on a rockery at a few feet above the ground-level. W. H. Divers, Belvoir Castle Gardens.

FOOD OF CROPS.

IT must always be remembered in estimating the manurial value of garden-refuse, stable litter, seaweed, or any other vegetable matter, that a considerable portion of the plant-food ingredients contained in these substances, namely, phosphoric acid, potash, and nitrogen, possess little if any value in excess of that which is already in the soil in the shape of undecomposed crop residue. A soil may show by chemical analysis to the depth of 9 inches from the surface to contain 4000 lb. of nitrogen per acre, and yet the yield of crop will be very small; and the addition of 150 lb, of nitrate of soda or sulphate of ammonia, providing only some 22 lb. of nitrogen available to the growing plants, is of more immediate value to that crop than the 4000 lb, that is practically locked up and unavailable. Yet from a purely chemical standpoint, by laboratory-test, the soil may be already supplied with enough nitrogen for the production of average crops to last 100 years

Some important investigations at the experiment station of Sir John Lawes, show that the Rothamsted soil may contain in its first 9 inches of depth 24521b. of phosphoric acid, and yet the addition of 3 cwts. of superphosphate, as manure, will increase in the average of years the crop of Barley from 28 to 42 bushels per acre, provided available nitrogen is present. The same soil shows on analysis in the top 9 inches of depth the enormous amount of 35,845 lb. of potash per acre, and yet the addition of sulphate of potash as manure, which provides potash in a much more readily and usable form, is found to increase in a marked degree the yield both of grain and straw; and under corresponding conditions, the production of starch in Potatos, and of sugar in rootcrops, is largely increased by the use of potash as manure. Where very large dressings of good and well-made stable or farm-yard maunre is used, the direct application of potash will be less necessary, because animal exerements contain a large proportion of this element. J. J. Willis, Harpenden.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

PHAIUS HUMBLOTI.—From the time of its introduction from Madagascar this lovely species has been cultivated very generally in the house with the highest temperature, and many of us know from experience that this has after a while resulted in the plants deteriorating in condition. On several occasions cultivators have been advised in these columns to try the plants under ordinary Cattleya-house treatment under which they undoubtedly here have made much progress, but which was not altogether satisfactory. For the benefit of cultivators, the advice given me by an enthusiastic amateur who is successful in the cultivation of this family of Orchids, is well worth following by those who have hitherto failed to obtain good results. After trials in various warm and intermediate temperatures, some few plants were placed in a shady position in the cool Odontoglossum-house, where, under the ordinary treatment as to watering, &c , they quickly regained bealth, with good leaves and strong flower-spikes. I am assured that this species, which hitherto has been placed in the category of plants difficult to mulage, is now happily considered to be the easiest Oreliid to grow amongst a large and varied collection. Any plants of this species which have finished flowering will begin to grow afresh, and some may require to be repotted. They should be potted a little below the rim of the pot, like an ordinary stove plant, the potting material being of a firm though porous nature, such as fibrous loam, leaf-soil, and sphagnum-moss, in equal parts, with a large proportion of small crocks, mixing the whole well together. Previous to repotting, examine the base of the pseudo-bulbs and roots in case incally-bug or scale may be present. The potting should be done moderately firmly, but do not afford much water till the roots are seen to be pushing through the compost, when the quantity should be gradually increased. When grown in the warmer divisions this species is always infested with yellow thrips, which, without doubt, cause unhealthiness, but if placed in the cool-house, these insects may not give trouble—at any rate, cultivators should give this cool method of culture a trial.

OTHER SPECIES OF PHAIUS that do well in the warmer houses, as P. Sanderianus, P. grandifolius, P. Wallichii, P. tuberculosus, P. Blumei, P. assamicus, P. Cooksoni ×, P. Marthæ ×, P. Owena ×, P. Owenianus ×, and Phains-Calanthe Arnoldiæ, being now in full growth, should be afforded water copiously at the root, and shaded from strong sunshine.

ERIAS. — Among Orchids not generally sough^t after are the Erias, several varieties of which are really worth cultivation, well-bloomed plants of the following species being very pretty and interesting objects: E. densiflora, E. floribunda, E. bractescens, E. stellata, E. acervata, E. flava, E. excavata, and the graceful E. æridostachya; all of them flower freely, and their cultivation presents no difficulties. These plants, which start to grow at this season, should be repotted if the compost be decayed, using fresh materials, viz., peat and sphagnum-moss in equal quantities, in well-drained pots. The Cattleya house, or that part of the warmer division which is freely ventilated, will snit them.

DISA GRANDIFLORA AND ITS VARIETY, BARRELLII.—These plants have their flower bads well advanced. They are liable to be infested with greenfly, which, if not destroyed, soon spoils the beauty of the flowers. The brush and sponge are the best means of ridding the plants of aphis, afterwards laying the plants on their sides, and syringing them till quite clean. It is not advisable to imigate these plants with tobacco at any time, the foliage being very tender, and liable to imjury. The plants should be freely supplied with water till they go out of bloom, when the quantity should be gradually reduced, but not entirely withheld.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

MELONS. - The plants which are to furnish a supply of late fruits should now be planted. Melon plants carrying several fruits will require very liberal supplies of water at this season, much more being now needful thau the earlier plants required when the days were shorter and the sun heat less. watering of the beds should be thoroughly done, small quantities frequently afforded doing harm by the roots often being left dust-dry whilst the surface may be moist. In affording water, it should not come in contact with that part of the stem that is, as it were, between wind and water, and a close stagnant state of the air in the house should be avoided, otherwise canker may be set up. If the surface of the Melon-bed cracks, as will occur when a clayey kind of loam is made use of, a thin coating of well-rotted manure should be applied as a mulch, Remove all the superfluous growths on the bine, and properly support the fruits. Excepting at the times of flowering and setting or ripening, the foliage may be syringed daily in fine weather when the pit or house is closed in the afternoon, and at other times sufficient moisture will be secured by sprinkling the floor, walls, &c. Plants growing in dung-pits and frames shoul I have the growth thinned and regulated, and sunheat fully utilised by shutting up after sprinkling the plants and the soil; with more air and less moisture, however, as soon as it is observed that the fruit is beginning to ripeu.

FIGS.—Trees with ripening fruit should be afforded air abundantly, day and night, the soil should be kept less moist, and aërial humidity reduced, but care should be taken that the trees are not impoverished. Old Fig-trees which are swelling-off the second crop of Figs should be liberally supplied with mumerate at the root, and freely and foreibly syringed on fine afternoons. The fruit on such trees should be somewhat severely thinned if the same trees will have to furnish early fruits next year. The shoots should be thinly laid-in, so that there will be ample space between them, and laterals should be stopped at the fourth or fifth leaf, reckoning from the base; or if

crowding be feared, remove them entirely. The mulching may be renewed if this be thought desirable, using the dung of corn-fed horses, which, besides admitting air and water freely, contains considerable quantities of ammonia, which is very beneficial to the Fig. It is prudent to afford but little stimulus to very vigorous trees, whether young or old, or excessive growth will result, which is sure to mature unsatisfactorily. Fig. trees growing in pots or tubs, and intended for forcing early next year, should be well supplied with water at the roots, also with manure water occasionally, and syringed once or twico a day. The very vigorous growths on these trees will require to have the points pinched out so as to preserve a proper balance of growth, and induce fruitfulness. Afford the trees plenty of space for light and air to play around them, so that the shoots make sturdy and thoroughly ripened wood by the end of the season.

CUCUMBERS.—The plants which are to supply Cucumbers in the autumn till the winter Cucumber plants come into bearing, should be planted forthwith. Those plants now in bearing should have all exhausted growths removed once a week, fresh bine laid-in, stopping all secondary shoots at one leaf beyond the fruit, affording water copiously at the roots, and avoiding overcropping.

THE KITCHEN GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

LATE CELERY.—Although Celery-plants put out at this season cannot be expected to produce large heads, the smaller heads produced are very acceptable in the spring, when the best are consumed. Owing to these late plants not being large, they are the better able to endure the severity of the winter with but little injury, if slight protection be afforded them. Should the Celery-trenches be not taken out, they should now be prepared as advised for earlier crops, with the exception that they may be narrower, i.e., 18 inches wide, and 3 feet apart. Each such trench will accommodate two rows of plants, and afford sufficient carth for efficient moulding-up. A few hours before the planting is done, which should be late in the day, afford water copiously to the soil in the trenches, and moderately to the plants to be transplanted. A slight shade should be given for a few days after planting, by sticking some tree branches along on the sunny side of the trench.

EARLY AND MAIN-CROP CELERY will require frequent watering whilst the drought lasts, otherwise growth will be stunted, and the sticks acquire toughness. The earliest planted Celery, if well attended in this respect, will have made good growth, and it may now be earthed-up for a few inches in length, or stout brown paper bound round the sticks, leaving the earthing to be done later on.

WINTER SPINACH.—This usually important ve etable requires a thorough preparation of the land. Choose an open quarter, for instance that which has been cleared of the early Potato crop, and if the soil be in good heart, no further manuring will be needed; but as the ground should be moderately rich, some short well-decomposed manure may be forked-in if it be considered necessary, keeping it, however, near the surface. After breaking down the clods, trample it evenly and regularly all over, making the surface line, and apply a slight dressing of fresh soot. Now draw the drills, which should be rather more than 1 inch deep, and 15 inches apart. Providing the seed is new and good, thin sowing is to be recommended, as the plants will eventually require to stand at about 8 or 9 inches asunder. The best time for sowing Spinach varies with the locality, and two sowings should be made, one forthwith, and the second one about August 10, which will suit the majority of gardens. It should be borne in mind that a good strong plant will stand a severe winter better than a small late-sown one. Either round or prickly-seeded varieties may be sown; and I find that the selected Victoria, or Long-standing Roundseeded, answer well for most gardens and winter use, and it is an improvement on the Pricklyseeded Winter Spinach. The leaf-production of this variety is very marked, as compared with the old prickly-seeded variety.

LIFTING POTATOS.—Early and mid-season varieties have quickly ripened off, and in the event of wet weather setting in, it will be advisable to lift all that have their skin sufficiently set, otherwise a second growth may be made, much to the deterioration of the quality of the tubers. After lying an hour or two, those intended for consumption should

be gathered up and stored thinly in a cool, dark shed; and those for seed may be left for a few days, and then be stored thinly on shelves in a cool frost-free place. Should wet weather occur, the Petato-disease would probably spread rapidly, as was the case last year; and where Potatos are ripe enough for storing, it is advisable, if only for this reason, to store them while they are in a dry condition. The tubers should be handled carefully, so as to preserve the skin intact.

SHALLOTS AND GARLIC.—These bulbs will now be ready for lifting, and after letting them lay on the ground for a day or two, they may be stowed away in the root-store, or some other cool and dark placo. Shallots have made good firm bulbs this year.

FRENCH BEANS IN COLD PITS.—About the end of the present month any vacunt cold pits may be utilised for raising a crop of French Beans. If the old soil, &c., remain in these pits, a smull quantity of fresh soil and rotten manure should be stirred into it, made quite firm by trampling, and the seed dibbled in, in lines 15 inches apart. The plants from this sowing should come into bearing before the end of September. The lights should be kept off the pits until there is danger from frost.

PLANTS UNDER GLASS

By JNO. McIntyre, Gardener, Woodside, Durlington.

LILIUM LANCIFOLIUM.—This species of Lily, if grown one bulb in a small pot, are pretty objects in the conservatory, or when grouped with other plants in entrance-halls and similar places. The bulbs will now have pushed out roots, and if space was left when the bulbs were potted for moulding-up the growth as it advances, the size of the bloom and the vigour of the plant will be much assisted by filling up the space that was left with loam and peat in roughish pieces—these the young roots quickly seize upon. A small quantity of Clay's or Thompson's fertiliser may also be mixed with the soil.

AZALEA INDICA.—These plants having complete I their chief growth, should be placed out-of-doors, in a warm position, sheltered from wind, and where the sun does not reach them for a longer time than three hours; at the first, even less than this is advisable, as the foliage having been made indoors, soon gets dise loured if exposed all at once to much sunshine. In fourteen days they will stand longer and fuller exposure to the sun. When turning these plants out-ofdoors, if thrips or red-spider are seen on examination of the leaves, syringe them thoroughly with Fowler's Insecticide, doing this in the manner advised by the sellers. If the plants were reported a few years ago, and they are in a root-bound state, it will be well to assist them with liquid farmmanure freely diluted with clear water. If frequent overhead syringing be practised with weak cow-dung water, insect enemies are prevented from attacking the foliage of Azaleas, and a healthy green appearance is given the plants, without which specimen Azaleas are poor things. Many other species of hard-wooded plants should nov be withdrawn from the houses and placed out-of-doors, such are Acadas, Ericas and Canellias, Pittospermum, Myrtus, Eugeuia, Oranges, Lemons, &c., all of which should be placed in shaded positions at first.

CYTISUS.—These plants, if they are placed outof-doors, should have their pots plunged in some cool
material, such as leaf-soil or sand, and, in fact, all
plants in pots and tubs should, when put in the open,
have protection afforded the latter, or injury to the
roots may occur.

CROTONS.—Afford these plants weak liquid-manure twice a week. The following may be employed with success, viz.:—cowshed-drainings, Clay's, Thompson's, and Beeson's Fertilisers.

GARDENIAS.—Any plants brought on from the spring strikings may now receive a shift—say into flower pots of 6 inches diameter, placing them when repotted in a Melon-house or warm pit in order to obtain rapid growth. Later-struck plants may have their final shift, using 4 or 5 inch pots, in which they will flower well. As a compost for this last shift inse peat, leam, and dried cow-dung, the first two in a coarse state, and the last finely broken up.

REIDIA GLAUCESCENS is a pretty subject for the dinner-table, its beautiful foliage being alone sufficient to recommend the plant for this purpose, although when covered with its small flowers it has its charms heightened. It is an easily-propagated plant, and one which, with ordinary cultural attention, can be had in good condition throughout the season. Cuttings should be struck in heat, and potted in 4-inch flower-pots in peat, leaf-mould, and loam, with a sprinkling of silver-sand. A 4-inch

pot will grow a Reidia of a desirable size, and large plants are not of so much usefulness as small ones.

GLOXINIAS.—Plants that are now going out of flower should be brought to a state of rest gradually, any hurrying of the process resulting in weakened bulbs another year. Afford less and less water till the leaves die down, then store away in a cool place at this season. Where a succession of flowers is looked for late this season, the plants will have been raised from seeds sown at the end of the winter, and grown on without large shifts, these plants being now pushed on rapidly in heat, with a considerable amount of humidity in the air.

OENERAL HINTS.—The work of veutilating the various houses will now require much vigilant attention, many of the plants brying completed their growth for the season, and more air will be needed than earlier to get the new wood matured. Stoveplants should be very carefully watered, as any lack of moisture at the roots is injurious at this hot season, the larger plants growing in tubs requiring to be watered at least twice a day, particularly those which are filled with roots.

THE HARDY FRUIT GARDEN.

By G. Wooddare, Guedener, Relieston Hall, Burton-on-Trent.

STRAWBERRY-BEDS.—Strawberry plants which have been cleared of fruit, and of which no runners are required, should have the latter ent off, and the beds cleaned of weeds. As bed little rain has fallen in many parts it may be found prudent to afford the beds a thorough application of water, following this with another of manure-water on the next day. If this be not done, the plants may prematurely lose their foliage, and the crowns fail to reach perfect development. All runners should be removed from the plantsd-out forced plants, and the latter well supplied with water.

RUNNERS. — When the layered runners have filled their pots with roots, they may be severed from the parent plants, eopiously watered, and stood for a few days in a shady position. Continue to layer Strawberry runners in pots, for forcing or planting out purposes.

FRUIT TREES.—The soil for some distance around all young fruit trees e crying a crop of fruit should be well saturated with water. Pyramids and other small trees which have been mulched, or the soil rendered crambly, or which is lightly dug over, can be easily afforded water; but larger trees in orchards under grass are not so easily afforded water, and they should have holes made with a sharp pointed crowbar, about I yard apart as fir as the roots extent, to allow the water to percolate down to them.

WASPS are now becoming numerous, and their nests must be sought for and destroyed. It is wise policy to buy queeus at a penny apiece about the end of the month of May, and give sixpence for every nest taken within the radius of a mile of the garden. If this were generally done their numbers would be g eatly lessened. As man is powerless to destroy every nest, and a good thing that he cannot do so, it is well to be provided with a number of wide-mouthed bottles, which should be half-filled with stale beer, or sugar and water, to be hung up in the branches of trees on which fruit is ripening. Immense numbers of wasps and flies are caught in these traps.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

GENERAL WORK .- The floral display is now at its best, and the time is propitious for note-taking to serve for future reference. It can now be seen where mistakes have been made in the arrangements of colour or of plants, and what would be better adapted for certain positions, aspects, &c. Laurels, Cupressus Lawsoniana, Thuia Lawsoniana, Thuia sibiriea (T. plicata), Holly, and other hedges of evergreens may be elipped or cut with souteur or the knife; and all growths of shrubs and trees may be removed when encroaching on the walks and lawns, or on other plants. Lawns and walks should be kept neat and trun, and the paths of gravel, sind, and spar kept free from weeds, and rolled in the case of binding materials. All flower-beds should be cleared of weeds. and the plants of seed-vessels, decaying blooms, and Groups of shrubs and trees standing near to frequented walks should be freed of all disfiguring undergrowth of Nettles or other weeds. The suckers arising from the stocks on which Roses and Rhododendrons are worked should be pulled up and not cut off, a second lot of suckers coming up if they are cut off during the present season. All inferior blooms on Roses should be removed, and the longest growths of

hybrid perpetuals should be somewhat shortened back, Teas and Noisettes being, however, allowed to grow uncheeked. Subtropical plants growing in beds or borders should receive timely support, or serious damage may be done them by the wind or rain. Where such plants are planted in beds, the undergrowth, if any, should be kept closely pegged down to the soil.

MARGUERITE CARNATIONS raised from seed sown early are rapidly coming into flower, promising to furnish a large quantity of bloom by the time the ordinary border varieties of Carnations go out of bloom. My experience of Marguerite Carnations suggests that two sowings should be made late in the winter, and again in the spring, about six weeks apart, the batch of plants raised from the first sowing being planted out on an open border, and those from the second sowing cultivated in pots. The first raised plants flower throughout the se son till the autumn; and the latter, if removed to a warm house, give a supply of bloom up to Christmas, and later. This strain of Carnations is so much improved, that many of the varieties possess blooms equal to named varieties, and if seed be obtained from a trustworthy source, 90 per cent. of double flowers may be expected.

PINKS AND CARNATIONS.—The former may now be propagated by pipings, or slips of the plants taken off with a number of shoots, these slips being dibbled-in deeply and kept moist. Where the layering of Carnations cannot conveniently be carried out, propagation may be done as for Pinks, that is, by pipings. When the pipings of Pinks or Carnations are made, insert them in sandy soil, 2 inches apart, in a cold frame or handlight. Some gardeners prefer to strike them in a frame placed over a partly-spent hotbed, but under these conditions the plants must be potted off or transplanted as soon as rooted to ensure success during the next season, whereas under the cooler treatment the cuttings take a longer time in forming roots, but on the whole they are sturdier, and better able to withstand a cold winter.

MYOSOTIS and other plants intended for the spring flower garden should now be transplanted, so as to have stur-ly plants of fair size when planting-time arrives. Nothing is worse for these plants than to allow them to be crowded together in the seed beds, as they never then assume their proper appearance, and usually have a weedy appearance in the autumn and winter, a time of the year when neatness in the flower-garden is of much importance. A showery day is the best for the job of transplantation, and renders shading and much artificial watering unnecessary, the plants at this season commencing to make new roots within a very few hours of their removal. Pansy seed may now be sown if the plants are required for the spring display, sowing on an open border, and lightly covering the seeds with fine soil. Keep the bell moist until the seedlings make their appearance, and after vards.

KAFFIR CORN-FLOUR AND MEALIE CULTIVA-TION.—The great increase in production of nonsweet Sorghums in the trans Missouri territory, and their heavy yields of seed or grain, are causing not a little interesting investigation as to what various uses it can be put; and this is especially true in Kansas, where a probably larger acreage of these crops is grown than in all the rest of the world. Within the past year considerable attention has quietly been given to testing its milling and culinary qualities, and one roller milling company at Marquette, McPherson County, reports to Secretary Coburn, of the State Doard of Agriculture, having ground not less than 1000 bushels of Kaffir and Jerusalem corn for household uses. From their experience, these millers find that the Jerusalem corn "mills" to much the best advantage, and although the flour as at present made has not the extreme whiteness of that from Wheat, Secretary Coburn vouches that it makes delicious biscuits, muffins, and griddle-cakes; while the millers claim the Kaffir flour is not quite so desirable for bread, but makes an excellent pancake flour. Important developments in the adaptability or these new grains for milling and food purposes seem likely in the near future. It is said that when ground on rolls by a gradual reduction process, the bran is readily separated; but the difficulty of radding the flour of its dark specks, so formidable from the cook's standpoint, has not yet been overcome. The product of these grains is on the market to some extent, as "Kaffir-meal," "Kaffir-flour," "Kaffirina," "Kaffir Graham," &c., and challenges comparison with any of the so-called "health" flours, at one half or onethird their prices. A Monograph of Bromeliaceous Bromeliads. plants has been awaiting notice for some time.* It forms one of the series of monographs of flowering plants instituted by the late Alphonse De Candolle on the termination of the Prodremens, and is the work of Dr. CARL MEZ. The Bromeliads have been favourite subjects of study with such botanists as Karl Koch, Regel, Ed. Morrey. WITTMACK, and other Continental botanists: whilst in this country, Mr. J. G. Baker has added to his many services to horticultural botany by the publication in 1889 of his Handbook of the Bromelinea (George Bell & Sons). Mr. Baker adopted thirty-one genera, and about 800 species, stating that in

all probability this number would be largely increased. And so indeed it has proved, for Dr. MEZ recognises forty-five genera, and nearly a thousand species, not including many doubtful horticultural forms.

As an order the group is very distinct, and easily recognisable. The leaves are usually in dense tufts or rosettes, and it is but rarely that a development in length of the leaf-bearing stem takes place as in some Puyas. For the most part of the species are epiphytes growing on trees, but some are terrestrial. Many are propagated naturally by offshoots or by easily separable branches, and flowers and fruits are correspondingly rare. The inflorescence is generally terminal, and either contracted or clongated, often turnishing excellent specific characters, and the bracts which it bears are lengthened reference to it. Their thick dry epiderm, scaly surface, and often spiny edges, are so many indications of their power to resist undue evaporation, to protect the young flowers from climatal inclemencies or injurious insects.

As to the flowers, they present little variation in essentials, though the details are diversified. The most interesting feature connected with them is the fact that some of the groups have uniformly a superior, others as constantly an inferior ovary, so that a character important enough, and constant enough, to distinguish one order from another, as Lilies from Amaryl-Itals and Irids, is in the Bromeliads, of such minor degree of constancy as only to be available for distinguishing certain tribes. The presence of certain scales or "lignles" on the petals is very characteristic of many of the

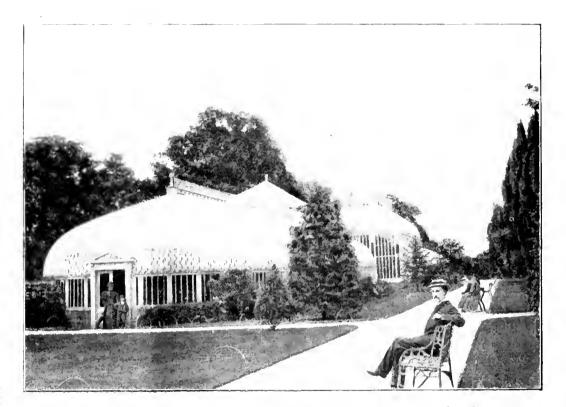

Fig. 19.-RANGE OF HOUSES, GLASNEVIN. (SEE P. 90.)

very often highly coloured as in many Tillandsias, and constitute the chief teature of the plants from a cultural point of view. The leaves crowded in rosettes often form cups, in which the rain-water is retained in such quantities as to be serviceable to travellers, though the water contained in the feaf-cups is mixed with decaying vegetable and animal matter. These decaying matters afford a supply of nitrogen. Acting on this hint, our late much-regretted friend, Professor MORREN, scattered fragments of ammonium carbonate among his plants with great advantage; and Dr. MEZ tells us that he himself kept a plant of Vriesea carinata in good health for a whole year

until, in fact, fruits were produced. The plant was destitute of roots, but the leaf-cups were kept filled with a per cent. solution of ammonium carbonate, together with small portions of nitre, phosphoric acid, and sulphates of lime and iron. The general appearance of the leaves of these plants is sufficiently familiar to our readers to preclude the necessity of any

genera. As to the colour of the flowers, it is noteworthy that in the same group, yellow is represented together with blue—the xanthic and cyanic series in this case occur in one flower.

The pollen-grains are sometimes furrowed, at other times porous, and this character has been deemed of sufficient importance by Dr. MEZ to be employed as a means of distinguishing the primary sub-divisions of the order. Dr. Mez has some interesting statements as to the relation between the varied forms of pollengrains, and the way in which the flowers aro fertilised by insects or by the agency of tho wind.

Without ontering into technicalities, which are not desirable in this place, we cannot enter into further detait on the conformation of tho flowers. The reader will find in 1)R. MFZ's introduction numerons interesting and suggestive notes, in which the co-relation between the structure and conformation, and the manners and customs of the plant are pointed out, thus adding interest to the dry descriptive details.

^{*} Monographeo Phanerogama um . editore et pro parte anetore, Casimiro de Candolle, vol nenum, Bromeliacca, auctore Carolo Mez, Parisis sumptibus, Masson & Cie

The Pine-apple (Ananas) furnishes an unique example, wherein the axis of the inflorescence and the bracts, all become fleshy and incorporated with the ovaries into one mass, which we know as a Pine-apple, it having as little to do with a Pine as with an Apple! The seeds furnish valuable points of distinction, some being provided with wing-like processes, by which their dissemination is effected.

The internal anatomy of plants so peculiar in their habits, and in their appearance, must need be of great interest, but for the details we must refer the reader to the text, merely mentioning and wingless seeds, including Bromelia, Nidularium, Æchmea, Bilbergia, and many other genera; secondly, into those with superior or partially superior ovaries, capsular fruit, and winged seeds, including Pitcairnia, Puya, and others. A third group has a superior ovary, capsular fruit, and plumose seeds. This group includes Vriesea, Tillandsia, and others.

Subordinate divisions are founded on the nature of the pollen-grains—smooth and destitute of furrows or pores—wind-fertilised plants, which Dr. MEZ characterises as Archaeo-bromeliae, as if they were the original types. In

F. W. MOORE (Vetron Medianus)
(Direct of of the Royal Botanical Garden, Glasnevin).

that the scales, which occur so abundantly on the leaves, play a double part. Sometimes they act as absorbent organs, whilst in other parts they are protective, and prevent unduce evaporation. The white, powdery substance on the inflorescence of the Bilbergias is composed of isolated ovoid cells. The Bromeliaceae, like the Cactaceae, are exclusively of American origin, extending from 38 N. latitude to 43 S., in Chile. Mexico, Ecuador, and South-east Brazil are the head-quarters of the order so far as the number of indigenous species is concerned.

Dr. MEZ divides the group first of all into those with inferior ovaries, indehiscent fruit, the second group, l'oratæ, the pollen-cells are provided with pores, through which the pollentubes pass; whilst in the third group the pollencells are sulcate or furrowed. The relative position of the ovary and the nature of the seed furnish, as has been already said, other points of distinction.

Or. MEZ's work is purely botanical, hence, unless incidentally, he says little as to their culture. In this country, in spite of their often brilliant coloration and easy enlture, they are little grown. On the Continent it is far otherwise. In almost every market-place the visitor sees little plants of Nidularium, excellently suited for room-plants; and one of our

compatriots, at least by birth, Mr. Wood, of Rouen, has a nursery largely and almost exclusively devoted to the culture of these plants for the Paris markets.

The origin of our cultivated Pine-apple is ascribed without any hositation to Ananas sativus, Schultes, a native of Central Brazil. The Smooth-leaved Cayenne and other spineless forms, belong to the variety lucidus. It must have been introduced to Europe since the discovery of America, and is consequently not mentioned in works previous to that period, and is one of the few cultivated plants the origin of which is known with anything like certainty.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Royal Horticultural Fruit, Floral, and Orchid Committees will take place on Tuesday. July 28, in the Drill Hall, James Street, Victoria Street, at 12 noon. At 3 P.M., a lecture on "Cacti," will be given by Mr. E. H. Charman, F.R.H.S.

THE GARDENERS' ROYAL BENEVOLENT FUND.—On Sunday last the Rev. E. S. BOCRNE, of Narcissus fune, preached in York Minster, on behalf of the funds of this Institution. The Minster was elahotately decorated with Palms and flowers on the occasion.

THE SHOW OF THE NATIONAL ROSE SO-CIETY AT ULVERSTON .- Mr. EDWARD MAWLEY, Hon. Secretary of the National Rose Society, says of this exhibition, that it proved much more extensive than had been anticipated, and the general quality of the flowers was higher than at either the southern or metropolitax shows. The total number of exhibition Roses amounted to 2610, or about 500 less than the average for the previous eight northern shows. Two of these exhibitions were, however, decidedly smaller, viz., that held at Sheffield in 1889, and that at Worksop in 1893. The show-day was nearly perfect as regards weather, and the attendance of visitors, as shown by the gatemoney (£112) was large, the usual receipts at the local show from this source being between £20and £30. In such a remarkably early season, it may be interesting to note the different parts of the kingdom from which the exhibits came. Excluding the local classes, forty-two of these were grown in England south of the Trent, thirty-seven in England north of the Trent, while fifteen came from Scotland, and the remaining eleven stands from Ireland.

NATIONAL CHRYSANTHEMUM SOCIETY .- The annual outing of the members and friends of this See ety took place on Monday last, a visit being made to the grounds and gardens of Aldenham Honse, Elstree, the residence of Lord Aldennam. Ample provision was, by the kind permission of Lord ALDENHAM, made for cricket, lawn tennis, and croquet, and a considerable number proceeded to the lake to fish. Dinner was served in a marquee on the grounds, Mr. B. WANNE, the chairman of the committee, presiding. The health of Lord ALDENHAM. with thanks for the use of the grounds of Aldenham House, was received with enthu-iasm, and Mr. E. BECKETT, his lordship's gardener, suitably responded. After dinner, a perambulation of the gardens and grounds was made, Mr. BECKETT acting as conductor. The grounds are suffering severely for want of rain, but the admirable condition in which the gardens are kept, and the perfect order everywhere observed, called forth the warmest praise. The bedding out is elaborate and attractive, Fuchsias being employed with singular success; there is, in addition to many beds, an enormous ribbon border, an extensive and elaborate sub-tropical garden, as well as many other interesting features. The large collection of Chrysanthemums in pots had a special interest, and they are so well-grown as to possess high promise for the coming season. The company, numbering some 150, returned to town in the cool of the evening, having greatly enjoyed the visit.

STARCH IN POTATOS .- M. COMON has communicated to the Société des Agriculteurs du Nord, France, the result of analyses made by him on specimens of four varieties of Potatos supplied by fourteen growers with the object of ascertaining the influence of manure on the richness in starch of the Potato. The following are the conclusions arrived at:-1st. The same variety of Potato may show great variations in the quantity of starch it contains, according to the locality whence the specimens came. 2nd. These differences are observable in all four varieties under observation. The cause is not to be sought in the plants, these coming from the same growers; the nature of the soil has no influence, but upon examination of the manures it is shown that in a general way the exclusive use of manures in which nitrogen prelominates is prejudicial to the formation of starch; on the contrary, the combined application of nitrogenous minures, with phosphates and potash salts, is favourable to the formation of tubers with an increased richness in starch. Rerue Scientifique.

THE SURVEYORS' INSTITUTION.—The Council being about to commence the construction of new and enlarged promises in Great George Street, the Institution will be removed to temporary premises in Savoy Street, Victoria Embankment, on August 17, 1896. Ample accommodation will be provided for arbitrations and consultations similar to those which have been held for the last 25 years at the Institution's house in Great Georgo Street, and may be secured by applying to the secretary, by letter addressed "The Surveyors' Institution" (temporary premises), Savoy Street, Victoria Embankment, W.C. The entrance to the Arbitration Rooms will be from Savoy Hill (on the east side of the Savoy Hotel).

STRAWBERRY VEITCH'S PERFECTION.—Under this name the new Strawberry, the result of crossing British Queen with Waterloo, raised by Messes. James Veitch & Sons, Chelsea, was exhibited by them to the Fruit Committee of the Royal Horticultural Society at Chiswick on June 29, when it was recommended for a First class Certificate at the next Drill Hall meeting. That award was unanimously made to it on the 14th inst. The fruits were fully described in the Gardeners' Chronicle of July 3, at p. 17, when it was called Majestic, but it has since been renamed as above.

PRESENTATION.-We learn from the Sheffield Dilly Telegraph of 17th inst. that the curator of the Botanical Gardens, Sheffield, Mr. WILLIAM HARROW, under whose skilful management the grounds and conservatories always present a beautiful appearance, has been the recipient of a handsome present from the committee on the occasion of his marriage. The present consisted of a silver tea and coffee service in Queen Anne style, and a silver, which bore the following inscription: "Presented to Mr. WILLIAM HARROW, with a tea and coffee service, by the committee of the Botanical and Horticultural Society, on the occasion of his marriage, as a mark of respect. May, 1896." In making the presentation, Ald W. E. Clecc, the chairman of the committee, alluded to the excellent work done by Mr. HARROW during the five years he has been at the gardens, and to the splendid condition of the gardens owing to his untiring exertions. Mr. Wm. Harrow suitably returned thanks.

CHESTER ART CLUB.—The museum building is now completed as originally plannel and intended. As an Institution it incorporates the museum of the Archaeological Society, the museum of the Natural Science Society, an art gallery, a lecture theatre, an art and science school, a library, and other rooms and appointments. It is fitting that it should be the home and centre of scientific, artistic, and literary education and culture. It is felt that the time has now arrived when some better and more continuous arrangement may be made for the advancement of art locally, and it has been suggested and urged that an art club for Chester would be in itself most desirable; and whilst finding commodious quarters and a suitable home within the museum, with sur-

roundings exactly suited to the requirements, the future organisation of art exhibitions and lectures would receive due and proper attention. Mr. Edmund J. Baillie is the Hon, Secretary of the Museum Management Committee.

SHIRLEY AND SURROUNDING DISTRICTS GAR-DENERS' AND AMATEURS' MUTUAL IMPROVE-MENT ASSOCIATION .- The monthly meeting of the above society was held on the 13th inst., at the Parish Room, Shirley, near Southampton, when the President presided over a large attendance of the members. Mr. J. Jones, the gardener at Terrace House, Polygon, gave an interesting lecture on the "Culture of the Cyclamen;" and one of his chief points was, that better plants can be obtained by sowing seed each year than by growing on old corms. The photographs of plants so grown, and shown by Mr. Jones, proved that to be the case. A hearty vote of thanks was accorded Mr. Jones for his excellent paper. The annual outing was held on the 20th inst., the places visited being Hampton Court and Messrs. J. VEITCH & Sons' Nursery, Chelsea. About seventy of the members, and a number of the Botley Gardeners' Association, travelled by a special train to Surbiton, and here they were met by Mr. A. DEAN, who had kindly saved the party a long wait by engaging some omnibuses, by which Hampton Court was reached. Having spent some time in the gardens and viewed the great Vine, the party proceeded to Messrs. J. VEITCH & Sons, Royal Exotic Nursery, Chelsea; and two hours were well spent in inspectiog the glass-houses, and various objects of interest. The party then dispersed to see the sights of London, returning by special train at 12.15.

TOMATOS.—There would be small sale for the half-ripened foreign Tomatos sold now in the market at low prices, if we were equally well supplied with home-grown fruit of as good quality and as ripe as that which reaches us from Mr. Rolfe, of Providenco Nursery, Stanford-be-Hope, Essex.—The variety, a selection from Perfection, is named Rolfe's Challenge, an uncorrugated, oblate-shaped, dark crimson fruit, the fruits sent averaging 11 inches in circumference. They were sent packed in precisely the same manner as the grower sends them weekly to Mr. G. Monro, of Covent Garden Market.—The variety is not only a handsome fruit, but it is a heavy cropper.

DRYING FRUITS.—The following figures may prove of interest to those intending present experiments in the field of dried fruit production for home consumption:—

A control de					
Aprients, gree	- 1	 5] Ib	make	I lb.	dr
Peaches		6 Th			
Prunes, Fren		 2110.	11	1 lb.	
., Silve		 3; 1b.	1.5	1 lb	
, Geru		 2] 15.	17	1 lb.	
Pears		 71 Ib.	1)	I lb.	.,
Nectarines		 8 Ib.	4.7	Ilb.	
Apples	 	 ti Ib.		1.1b	

These figures, it should be noted, show the average shrinkage of a mixed lot of fruit; the loss of weight is not so great with varieties specially selected for drying purposes. These figures are given on the authority of Mr. J. C. BLACKMORE, whose opinion has much value in the New Zealand fruit-growing districts.

SOCIETY OF JERSEY GARDENERS. — This society held its first public show and floral fitte on the 16th inst., in the public park at St. Heliers. Though this was the first attempt of the kind made by the young and flourishing society, the Mayor of St. Hellers, who opened the show, declared that he hoped to see it repeated. The Lieutenant-Governor of the Island (Major-Gen. Horton) and Mrs. Horton, with a host of the local élite, visited the show, being received by the President of the Society, Mr. A. Luxon. There were no fewer than 169 classes in this maiden show, the entries numbering considerably over 450, and the exhibitors over eighty. A number of special prizes were given by various firms and private persons, while a floral go-cart com-

petition was organised for children, the rewards consisting of a Gold and three Silver Medals. Jersey has a justly-earned reputation for the beauty and luxuriance of its floral and fruit productions, and this show was pronounced by impartial observers to be fully up to the standard of British exhibitions. A few English firms exhibited some specimens, but did not compete. The band of the old 58th Regiment was in attendance. The gatemoney during the afternoon alone totalled over £50, which is considered capital for Jersey; and in the evening, when the price of admission was reduced by one-half, thousands passed the barriers.

MR. REDFIELD'S HERBARIUM.-Mr. MEEHAN writes :- By the will of Mr. J. H. REDFIELD his herbarium is to be sold, the proceeds to go to a fund for the benefit of the Herbarium of the Academy of Natural Sciences of Philadelphia, in which he took so much delight. His Herbarium of North America was intended as a companion to Torrey & Gray's Flora of North America, and GRAY'S Synoptical Flora, and except GRAY's own Herbarium and the Herbarium of North America, is probably the best representative of the flora of North America extant. There are 16,829 sheets. More than half of these are recognised species, and the other varieties or duplicates showing geographical range. They are all glued down on fine paper of herbarium size, and labels fastened on. Mr. Caoby, our well-known botanist, places them as cheap at £2000, which we ask for them. His Fern collection is separate. We ask for them £500. These, with Lycopods, and the few other vascular Cryptogams, 3121 sheets, divided in about two sheets to a full species as before.

A MEMORIAL OF LINNÆUS.—An interesting souvenir has lately been presented to the Natural History Museum of Paris by M. Deyrolles, of Bourgla-Reine. It is the snuff-box which Thunberg had made in Japan for his friend and master, the great Linnæus. Unfortunately, Linnæus had been dead over a year when the box reached its destination, and it consequently passed into the possession of his son. It has since formed a conspicuous object in several famous collections. The box is about 8 centimètres in diameter; it is lacquered with gold in several colours, and the rural scenes on it are singularly appropriate to the habits of Linnæus. Athenæum.

"JUGLANDACEÆ OF THE UNITED STATES, by WILLIAM TRELEASE. This is a paper reprinted from the Seventh Annual Report of the Missouri Bitanical Garden. It is devoted to "such a tabulation of the fruit, twig, bark, and bud characters as it is thought will be helpful in field studies, with notes on the hybrid forms referred to." The information is so clearly given that it should not fail to secure the desired end, while it is aided by the addition of twenty-five plates made from drawings and photographs specially prepared for purposes of illustration and definition.

YORKSHIRE NATURALISTS' UNION. -The 126th meeting of the Yorkshire Naturalists' Union will be held at Staithes for the investigation of the neighbourbouring coast, and the Easington and Roxby woods, on Bank Holiday Monday, August 3, 1896. Members desiring accommodation should communicate with Mr. James Spink, Station Hotel, Staithes, R.S.O., Yorks. The district for investigation is included in Sheet 104 S.W. (New Series Sheet 34) 1-inch Ordnanes Map (also published geologically coloured), and falls almost entirely within the limits of Sheet 19 of the 6-inch Map, but a small portion is in sheet 18. Reference may be made to Tate and Blake's Yorkshire Lius, Phillip's Geol. Yorks. Coast, Young & Bird's Gool, Survey of Yorks, Coast. Permission to visit their properties has been kindly granted by Sir Chas. M. Palmer, M.P., and Captain Turton, and by Mr. Samuel Broune (shooting lessee). The district for investigation includes the coast line from Run-wick Bay to Boulby Cliff, and the wooded glens, the drainage of which falls into Staithes Beck.

The Yorkshire Geological and Polytechnic Society have organised an excursion on Friday and Saturday, July 3I and August 1, for the examination of the coast sections between Blea Wyke and Whitby, under the leadership of Mr. P. F. Kendall, F.G.S., Dr. W. Y. Veitch, and Rev. J. Hawell, M.A., with a meeting at Whitby on Saturday evening. Monday's geological ronte, given above, is planned in continuation of these arrangements. The geological section will be represented by its President, Mr. P. F. Kendall, F.G.S., and its secretaries, Rev. W. Lower Carter, M.A., F.G.S., and Mr. J. W. Stather, F.G.S. The botanical section will be officially represented by its President, Mr. M. B. Slater, F.L.S., and one of its secretaries Mr. J. J. Marshall, and the Mycological Committee by Mr. Chas. Crossland. The Vertebrate section will be represented by its President, Mr. Thos. Nelson, M. B.O. U. Marine zoology, conchology, entomology also form subjects of investigation. The President of the Union is John Cordeaux, Esq., Great Cotes, Lincolnshire; Hon. Secretary, W. Denison Roebnek, F.L.S., Sunny Banks, Leeds; the lowest on record. The establishment of village settlements for the unemployed has not been encouraging, only one having met with any amount of success. About thirty-five branches of the Sydney Labour Burean have now been opened in country districts; the number of unemployed who have registered at Sydney has slightly decreased of late. Applications for homestead selections under the Land Act of last year continue to be very numerous. Considerable reductions are being made in the number of civil servants, involving a large annual saving of money. The irrigation colony of Mildura is in liquidation, but it is said that the Victorian Govern ment may assist the settlement. General female servants, able to do cooking, washing, and housework, are in good demand in Victoria, and cooks, honsemaids, nurses, &c., in the larger towns. There are excellent openings in Victoria for farmers, dairy-farmers, fruitgrowers, and wine-growers, if they have a little capital, and some experience of the country. In South Australia there is a plentiful local supply of mechanics, and of farm and general labourers, and

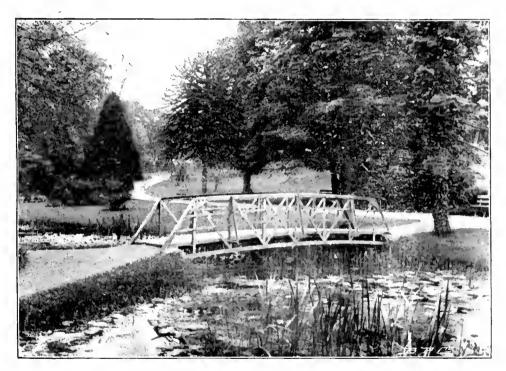

FIG. 21.—VIEW IN THE ROYAL BOTANICAL GARDEN, GLASNEVIN, SEE P. 59.)

and Hon. Secretary for this meeting, Rev. J. Hawell, M.A., Ingleby, Greenhow Vicarage, Middlesborough. Programme of meetings:—4.15 p.m., meat tea, 2x. each, at the Station Hotel, Staithes; 5.0 p.m., sectional meetings; and 5.15 p.m., general meeting, at the Board-School, Staithes. The chair at the general meeting will be taken by Mr. T. H. Nelson.

HINTS TO EMIGRANTS .- The July Circulars of the Emigrants' Information Office and the annual Handbooks show the present prospects of emigration. There is a demand for farm labourers in the northwest of Canada and in New Brunswick, but in Ontario the local supply of men is for the most part sufficient. There is little or no demand for mechanies in any of the Canadian towns, and in Toronto especially employment is very scarce. The demand for female servants continues. In New South Wales the output of gold in 1895 showed the very satisfactory increase of 35,378 oz. as compared with that in 1894, the increase being largely owing to the number of unemployed men sent by the Sydney Labour Bureau to work on the gold fields. The production of coal in 1895 was 66,000 tons more than in 1894, but the aggregate value was less, the selling price of coal having been

there is no demand for more hands. Recent returns show that the value of the imports in 1895 into South Australia was the smalle-t for many years, and that of the exports was considerably below the average, The decrease in the value of the exports appears mainly in agricultural produce and in minerals; in animal pro inctions there was a fair increase. The value of the manufactured articles exported in 1895 was greater than that of any previous year, and was nearly double that of 1893. In the Northern Territory of South Australia the exports and imports in 1895 were less than those in 1894; little progress was made in agriculture and the mining industry, with the exception of gold-mining, which is carried on almost entirely by Chinese, was still very small, The export of cittle to Jiva showed a large decrease, and the only industry which really improved was the pearl-shell industry. There is no demand for more labour in the Territory. In Queensland, speaking generally, prospects are improving throughout the colony, but there is no demand at present for more hands. Agriculturists ean now obtain steerage passages to the colony at £12 a head, by applying to the Agent-General in London. There are excellent openings for farmers with a little

capital in the sngar districts, after they have acquired some experience of the country. Female servants are difficult to obtain at Brisbane, as young women prefer to engage in the tailoring or some other trade. In Western Australia there is a good demand for carpenters and bricklayers, and for mechanics generally. There is also a good demand for miners at £4 per week in the Coolgardie and Murchison gold-fields, and at Coolgardie men competent to work on the roads (not railways) are wanted at £3 10s, a week. The demand for female servants continues.

BUDS AND GRAFTS OF FRUIT TREES .- Only those of limited means know of the difficulty that is experienced in obtaining fruit trees of good varieties, and many a cottage garden remains treeless from the sheer inability of the tenant to purchase worked trees. Moreover, were the demand for fruit trees greatly increased, it could not be met by our present nurserymen, seeing that they now dispose of all that they can raise. Why, therefore, should they not advertise the sale of buds (on the shoots) at this season, and scions for grafting in March and April? These, if sold at a penny or twopence per shoot, according to rarity or the reverse, would be readily bought up in a season or two. Stocks of various kinds might also be sold in small numbers at an equally cheap rate, benefiting both nurserymen and cottagers. Once start the cottager in the business of fruit-growing in this cheap fashion, he would in a few years be able himself to become a purchaser of one, two, and three-year-old trees and bushes from the nursery.

FLAX AND HEMP CULTURE IN ENGLAND .-- At the invitation of Hanslip Long, Esq., J.P., a number of prominent landowners and farmers recently attended a meeting at Shippea Hill, near Ely. to meet Mr. A. KINNEAR, the fibre expert and managing director of the English Fibre Industries, Limited, whose offices are at 52, Coleman Street, London, E.C., and works at Shelford, Cambridgeshire, and Long Melford, Sutfolk, for the purpose of inspecting Mr. Long's first crop of Hemp grown for the company. One twenty acre field was inspected, and the height of the crop of Hemp was ascertained to be 6 feet 4 inches, the plants still growing strong, with a wonderfully healthy look. This was sown on April 25, and on June 6 it was I foot 10 inches high; on the 22nd it was 5 feet 4 inches, showing a growth in sixteen days of 3 feet 6 inches; and on the day of inspection, June 29, one week later, it measured as above-6 feet 4 inches. The crop will be ready for harvesting bout the end of this month, when it will probably be 9 feet high. No doubt five tons will result to the acre instead of three tons, as held out by the English Fibre Industries, Limited. The cost of growing is about to per acre:-

Cost of Seed	 ()	10	()
Rent, Rites, Taxes, and Tithe	 1	10	-0
M.mure (Artificial)	- 1	()	()
Ploughing 3 times)	 1	1	0
Howing	()	- 2	()
Harrowing and Drilling	()	5	-0
Harvesting	1	$I\theta$	-()
Total parage	4.5	19	()

The produce per acre will be five tons, and the company pays £3 10s, per ton, which equals £47 10s, per acre, and, after deducting cost of growing at £6, leaves a net profit of £11 10s, to the grower.

PINK AND BLUSH COLOURED SOUVENIR DE LA MALMAISON CARNATIONS AT NEWSTEAD ABBEY.—These afforded a lovely sight on June 24, and were perhaps at their best, with about 600 fullyexpanded flowers open at the time. The house in which they are flowering is one of a new range erected about two years ago, and measures 28 feet long and 13 feet wide," a span roof, with top and side ventilation. A path is down the centre, and two beds, one each side, both of which hold some 280 fine plants in excellent health, and entirely free from disease. The two year-old ones are in 9-inch pots, which will be layered this month, average twenty-two and twenty-four strong shoots each, and those 75-inch pots were layered in the middle of July, 1895, and are good stuff, with about ten and twelve strong shoots each, in robust health, with nice

glaucons foliage. They are not growing in Banstead loam, but in the ordinary sandy loam out of the park, with other mixtures. Mr. McCulfoch takes a pride in doing the Malmaisons himself, being an old pupil of Mr. Smith, Mentmore, where Malmaisons abound, as at Ascott and Tring Park. I may add that clo e upon 4000 of the leading sorts of border Carnations are planted in the borders round the Rose garden, and look remarkably well, considering the dry season.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY. - The mouthly meeting of this Society was held at their room, 25, Westgate Road, Newcastle-on-Tyne, on Tuesday, July 14. Mr. JNO. BULLOCK presided over a good attendance of members. There were several collections of cut blooms of herbaceous plants, shown by members, which were much admired, and created a good deal of discussion. The remainder of the evening was profitably spent with the microscope, through which many interesting objects were viewed, including various species of fungi, sections being made and mounted by Mr. CH. INNES.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY. The nineteenth annual excursion of the Royal Scottish Arboricultural Society will take place on Tuesday and Wednesday, August 4 and 5, 1896, to the district lying between Stirling and Loch Lomond. A general meeting of the society will be held in Edinburgh on Monday, August 3, of which further notice will be given. On Tuesday, August 4, the excursioni-ts will leave Edinburgh (Waverley Station) at 7.5 A.M. by train due at Stirling at 8.25, where breakfast will be served in the Station Hotel. Leaving the Station Hotel at 9 o'clock, the party will then drive in succession to Airthrey, Keir, Doune Castle, Blair Drummond, and Lanrick. Callander will be reached about 7 EM, where the members will dine together in the Dreadwought Hotel at 7.30, and afterwards spend the night there. Professor Schwaffach, of the Forest Academy ut Eberswalde, Prussia, will be the guest of the society at dinner. Second day After an early breakfast, the party will have the Dreadnought Hotel, Callander, at 7.30 A.M., drive through the Trossachs, sail up Loch Katrine, and drive to Inversnaid on Loch Lomond. Here a special steamer will be in waiting to convey the party to Balmaha Pier, which will be reached about $12.15~\mathrm{P.M.}$ The members may also have an opportunity of visiting Inch-Lonaig-the Island of Yew Trees-and Inch-Cailloch. The remainder of the day will be spent in walking through and inspecting the extensive policies and woodlands around Buchavan Castle. The party will leave Drymen Station by train at 7 r.m., arriving at Stirling at 8.18, and Edinburgh at 10 o'clock. The Council have agreed to recommend to the Society that the excursion in 1897 should be held in the United Kingdom-probably in Ireland; and that in 1898 the forests of some country on the Continent of Europe should be visited, notice of which will be intimated to the members as soon as the preliminary arrangements are settled. There are still for sale a few copies of the two large photographs of the excursionists, and of the Album prepared by the Excursion Committee after their return from Germany. Further particulars in regard to the cost of the excursion, provisional deposit, &c., will be furnished by Mr. ROBERT GALLOWAY, Secretary, 5, St. Andrew Square, Edinburgh.

HOME CORRESPONDENCE.

EXAMINATIONS IN HORTICULTURE. - An inspection of the list of honours lately issued in the thurdeners' Chronicle shows that those with most leisure for study manage to secure the highest places in the results. It would be a privilege if your columns could be open to receive the experiences of your readers on the reasons why so few practical gardeners attend the examination. Information on two points would be valuable, viz., (1) What spare time can the average gardener devote to study? (2) Is the busy month of May the most convenient to practical men? [We believe the date will be altered. En.] A contemporary suggests that gardeners keep aloof because the examination is open to amateurs and to women. This suggestion seems childish, in face of the fact that a practical gardener bolds a better place in the lists than seven Chel usford students and twenty eight college candidates. Practice

VENETIAN SUMACH—RHUS COTINUS. - There is to be seen just now at Luddington House, near Egham, a fine bush of the above in the utmost per The bush, notwithstanding it has been d siderably curtailed, in consequence of its being planted too near the carriage drive, measures over 63 feet in circumference, and is of considerable height.

1 had this beautiful shrub in fine feather at Enville, and it used to be greatly admired by the numerous visitors; it was also a special favourite with the late Earl of Stamford and Warrington, but I never saw one so beautifully coloured and densely flowered as the above. Why it is not more planted seems a mystery, for it is one of the most elegant s'irubs we There are also to be seen there two fine Judas trees, Cercis siliquastrum, and an immense evergreen Oak. Edward Bennett, Queen's Rond,

A PROLIFIC CUCUMBER.—I enclose you a photograph of a bunch of six Cucumbers named Blendworth Perfection, which I have hanging at the present time. The average length is 21 inches, and girth 7 inches. It is a flit bine 3 feet before the fruit, and 2 feet above the fruit. The six fruits come from two axils only 2 inches apart, so that the fruit all hang together; therefore I was obliged to loop them out to g t a view of the six, and, as you will see, the leaves broke out all round the bine.

John Bushy, The traveless, Blendurthye, Horno Loddean. Hants.

HER MAJESTY AND DUKE OF YORK GLOXINIAS. A few days ago I saw one of the finest private collections of these varieties which I have seen for some time past at Fairy Hill, Swansea, the residence of Benson. There are some 250 plants in fine condition, some of them being two years old, which carry from fifty to sixty fine blooms on each. Last year's seedlings are carrying from twenty-five to thirty blooms. The majority of the plants are grow-ing in 5-inch flower pots, which Mr. Miller, the gardener, told me are intended for decorative purposes in the dwelling. I may say that Mr. F. J. Beuson is much interested in these and similar plants, and in Border Carnations, of which he has a very fine collec tion. R. Milner.

EARLY PEARS. -It was odd that but a few days prior to the publication of "Beurro" Hardy's " note respecting early Fears last week, there should have been exhibited at the Drill Hall three dishes of Citron des Carmes, represented by him as an August Pear, The best flavoured, undoubtedly, was yet fully ripe. the dish sent by Messis. Veitch & Sons from Langley, along with a dish of Doyenné d'Eté, both equally ripe. Yet the latter is by the writer named mentioned as a July Pear, and the former as ripe in August. Again, the Drill Hall meeting of the 14th saw the first competition for the prizes offered to amateurs for the best-flavoured Pears, when two dishes were staged, both being Citron des Carmes. Evidently this variety was held to be by the senders better flavoured than Doyenné d'Eté, which is here to-day and gone to morrow, so far as quality is concerned. committee of three members appointed at the meeting to act as judges in this competition, Messrs. A. F. Barron, J. Smith, and H. Balderson, taking the higher flavour found in Messrs. Veitch's dish of Citron des Carmes, grown on ordinary nursery trees as a standard, awarded the 2nd prize only to the dish sent from the Royal Gardens, Frogmore, the other dish having fruits over-ripe and under-ripe. At the next meeting

on the 28th the same variety from other districts, and others named by "Beurré Hardy," may be looked for. A. D.

GOLDEN CHAMPION GRAPE, SPORT, OR SEED-LING, OR BOTH?—There can be no doubt that the Golden Champion, as grown by Mr. William Thompbim, as stated in last week's Gurdeners' Chromicle.
Like many others, I went to see the Champion as well as the Duke, and there heard the genesis of the Grape, as far as it could be told, from the raiser's lips. Another fact, however, is comparatively little known, viz, that at Culford Hall, in Suffolk, the Champion was reproduced on a Sweetwater, if I remember rightly. There can be no doubt of the extraordinary versimilitude of this sport or bud variation to the true Champion, in size, colour, texture, and flavour. There was always a certain amount of mystery about its development. As I understood it and dear Peter, and I often talked the matter over with him, the Champion was once worked on the Vine, and there, as in many other places, it did not come up to expectations, and was cut down considerably below the point of union. The following year the Vines pushed out a branch of Champion wood, and with it a bunch of Champion Grapes, and the Champion character adhered to this portion for some years. Culford case, however, although curious, hardly goes to establish an independent sport, but rather the prepotency of the Champion over its old stock. D. T. Fish.

STRAWBERRY GARIBALDI, SYN. VICOMTESSE DU THURY, OR OTHERWISE ?—A discussion that brings such great authorities into the field as Messrs, A. F. Barron, so long and so ably presiding over the gardens of the Royal Horticultural Society at Chiswick, and Edward Bennett, to say nothing of others, can hardly fail to prove interesting to your readers. How far their statements are calculated to convince doubters that these two Strawberries are one and the same, and if so, that one must of necessity be Vicomtesse Héricart du Thury, is quite a different matter, as no question of shifting the labels of these Strawberries of set purpose or mere caprice, and so confusing their identity, has been raised. It is difficult to see the bearing of Mr. Bennett's successful dexterity in label-shifting among Tricolor Pelargo-mums to the question before us, the distinctness or otherwise of these two Strawberries. Besides, such experts among tricolors as our late friends Messrs. Peter Grieve and Mr. Wills, could possibly Messrs. Peter Grieve and Mr. Wills, could possibly easily have replaced the labels, and, after all, Mr. Bennett winds up "Garibaldi and Vicomtesse are not the same." "no doubt, they are not the same variety." Cultivators will be prepared to accept all that Mr. Barron says, especially when backed by the yet higher authority of the late Mr. Robert Thompson of Characteristics for first appropriate to first appropriate to the country. of Chiswick, the first pomologist of his country. of Chiswick, the first pomologist of his country. But it is very important to note exactly what was said and done. According to Mr. Barron, the late Mr. Robert Thompson saw the Vicomtesse Hericart du Thury first in France, and advised that it should be taken special care of. Later on it had been transferred to Chiswick, and was noticed by Mr. A. F. Barron, and the late Mr. Gilbert of Bureigh, who questioned Mr. Thompson about the transfer. Next day they found it named Vicomtesse stranger. Next day they found it named Vicomtesse Hericart du Thury. And Mr. Barron assures us that thousands of plants were distributed among the Fellows, of which no one can have any possible doubt. Mr. Barron, however, adds that later on the Vicomtesse became very popular for market purposes around tesse became very popular for market purposes around Edinburgh, Aberdeen, &c. It would be interesting to learn if these commercial centres were also sup-plied with plants from the Chiswick stock. Mr. Barron establishes several points. Mr. Robert Thompson saw and selected the Strawberry in France. Possibly he gave it, he certainly imported it under, its present name. Finally, it was propagated and distributed from Chiswick as Vicomtesse Héricart du Thury. All these facts prove what no one denies, that the Vicomtesse exists in abundance and flourishes. But how can they prove the non-existence of Garibaldi? It is But how ean grown under my eyes here distinct and different fram Vicontesse Héricart du Thury. Unfortunately my long journey to Edinburgh forced me to leave some tons of reference-books behind me. But Garibaldi lives in our horticultural literature. One of the earliest references to it that I can lay my hands on at present is by Ferdinand Gloede of Hamburgh, who, writing in the Garden, December 2, 1876, twenty years ago, says:—"Many years ago Mr. Nicholson, of

Eaglescliff, near Yarm, in Yorkshire, raised a seedling Strawberry, to which he gave the name of Garibaldi. I had plants of it from him which I cultivated for several years in France." Could Garibaldi have been re-imported under its new name of Vicomtesse Héricart du Thury / Meantime, Garibaldi having been distributed in England got mixed up with Vicomtesse, and grown as Garibaldi. If, adds Mr. Gloede, Mrs. Nicholson has still Garibaldi, as raised by her late husband, it may be got at Eagleschiff true to name, and thus everybody will be convinced that there is a great difference between Garibaldi and the Vicomtesse. In the same issue, William Tillery, of Welbeck, writes to state that Garibaldi as sent to him from Lawson & Co., Edinburgh, is quite a distinct variety from Vicomtesse Héricart du Thury. Another correspondent also writes to testify that Mr. Nicholson, the raiser of Garibaldi, is too honest a man to comive at that or any other deception; and Mr. Edward Bennett, who used to live at Rabley, should be able to speak with special authority as to the merits of Garibaldi for forcing. The following notes are from the Garden of some twenty year-"Garibaldi is the name of a Strawberry

established itself, and at first they will not grow it largely. We gardeners are very conservative. Since some notable introductions have been made, which, I think, will come to be considered standard The raising of new fruits of any kind, and especially Strawberries, which are our most popular fruit, as it is one that can be grown by almost everyone who has a garden, is a good work; and he who succeeds in obtaining a variety superior to existing ones deserves the recognition of his fellows. It is a pleasure to find gardeners in private places as well as specialists striving to produce something better than we have got. Such success was Mr. Allan's in 1891. when he gave us three good new varieties. I will take Mr. Allan's seedlings first, as having priority in point of time; and though my favourite variety, viz., Gunton Park, was certificated in 1891, I place it first in my list owing to its being a good forcer, carable of standing drought, its splendid flavour, and fine appearance when grown at its best. Allan's idea in raising new varieties is not mere size. but good quality; and although we have both in the variety Gunton Park, he depended greatly on the influence of British Queen, which was one of its

FIG. 22 -VIEW IN THE ROCK GARDEN, ROTAL BOTANICAL GARDEN, GLASNEVIN. (SEE P. 89

extensively forced for the market by Mr. Bennett, of Rabley. It seems to have merit as a forcing kind, being long-bearing, bright, and red in colour, and good in dayour. Mr. Bennett's plants have been gathered from eight times this season, and he says the last gatherings have furnished the finest fruits, A year later, April 7, 1877, it is said: "Garibaldi Strawberry.—Good punnets of this Strawberry are still being brought into Covent Garden Market by Mr. Bennett, of Rabley: the fruits are of fair size, and equal in colour to Strawberries in May. plants on which they are produced were grown from rmnners last summer, brought gradually on, and some 200 of them are now loaded with fruits, which when placed side by side with Keen's Seedling, show a decided advantage, both as regards cropping quali-ties and appearance." My verdict as to identity is My verdict as to identity is still the cantious, sensible Scotch one of "not proven." And if it can be proven, I should then emphatically vote for the shorter, perhaps older name, Garibaldi, D. T. Fish.

NEW STRAWBERRIES.—I should, with your permission, like to say a few words on new varieties of the Strawberry introduced during the last half dozen years; and though a few of my readers may not think a Strawberry new which is six years old, there are many gardeners who do not grow new things much, if at all, at first, but wait till a variety has

parents. It is an excellent variety in any soil, if the treatment is a proper one. The other varieties are Empress of India and Lord Suffield, the last named being introduced in 1892 - Its fruit is distinct; the plant is a good forcer, and flavour is very good. It s one of the finest Strawberries yet raised in regard to flavour. The variety Empress of India resembles more nearly British Queen than any of the others; it has bright scarlet-coloured fruits, which, though not very large, are in flavour far in advance of some other larger and older varieties. We now come to a distinct break in Strawberry raising in a variety which will. I think, be a favourite for years to come, on account of the freedom with which it grows, and great cropping properties, v.c., Laxton's Royal Sovereign. In penning these lines, it occurs to me how much gardeners owe the lite Mr. Laxton not alone in new Strawberries, but other plants. I cannot say too much in favour of Royal Sovereign, and I believe that it will hold its own for earliness, size of fruit, and for freedom of growth—the latter a great point in some soils.—I must say that 1 am an admirer of large fruits, it may be bad taste on my part, but it is one that at least, can claim to be common, most persons admiring a fine lot of Strawberries when placed upon the table. I am inclined to give this list-named Strawberry a high place for its general usefulness, as being also the best for forcing, and unequalled for size. The flavour is first-rate, although it lacks the sugary qualities

that some other varieties possess, but this is an advantage, as we have none too many varieties of that description, and it is very good in every other point. It is not the largest Strawberry, Auguste Nicaise being larger, but if weight of crop be considered, it is a long way ahead of others. As an early fruiter there is none to equal it if it be treated as an annual plant, and it is the best of Strawberries for general cultivation. Another of Mr. Laxton's seedlings is Leader, recently illustrated in these pages, which promises grandly. It may be regarded as a mid-season variety Messrs. Laxton say it will force well; it is certainly a fine fruit, and good in the open. Leader is one of last year's novelties, and time has not been given it as yet to test its forcing capabilities. One of its parents, Latest of All, is a special favourite, but this lastnamed requires special good culture; Nonsuch comes from the same source, and may be termed a grand fruit, large in size, and like one of its parents (Captain), the plant is a heavy cropper, and of distinct character. This is one of the seedlings of 1895. This year the variety will get a good test as to cropping capabilities. I should say that Monarch will be invaluable as a variety to follow Royal Sovereign as a forced plant, and besides, become a market I have previously noted the value of Latest of All, another of Laxton's raising, a grand fruit, but not the latest cropping variety. It is, as regards size and flavour, at the present without an equal. has one blemish—the fruits are not always of the best shape, and like most of the Queen funily, to which it belongs, it does not ripen at the point. The plant makes but few runners, and young plants, specially well done, crop splendidly. Laxton's Scarlet Queen and Sensation are new, but I prefer those previously named. These last two may be as good as those in some soils and localities. John Ruskin is much liked in the north, and some persons prefer it to those I have described. It has not been grown in quantity at Sion. A novelty that will be heard of again, viz., Veitch's Perfection, was certificated on July 14 by the Royal Horticultural Society, it was raised by Messrs. Veitch from British Queen and Waterloo, and is a splendid looking fruit, with finest flavour G. Wythes.

NEW STRAWBERRIES -- It must be regarded as an undoubtedly interesting though not a remarkable coincidence, that Mr. Seden of Messrs, Veitch & Sons, and Mr. Carmichael of Edmburgh, should have been effecting just the same crosses in Strawberries, and very possibly producing precisely similar results. The Southern Easer, largely because of his more favoured situation, is, however, the first in the field with his new production - and a very delicious one it is too. That there is nothing remarkable in the cross is due, of course, to the fact that British Queen is the best possible parent so far to use for the giving to Strawberries that flavour so much needed, and with so many otherwise fine varieties so much lacking. Waterloo, also, both because of its good sturdy habit, free bearing, fine fruit, and comparative lateness, as well as rich colour, seems also to be a very natural variety to employ as a parent. We shall be glad to learn from both sources which of the two varieties was the pollenparent. Of course, rich as the fruits of any new one may be in flavour, deep in colour, and large, yet so erratic are Strawberries that comparatively few varieties do well everywhere. General conduct is a point to be tested, but if none are planted there is no testing. We seem to have dropped just now upon an era of Strawberry raising. Those raisers who produce really first-class high flavoured sorts that universally good doers, will indeed merit the highest

CHURCH DECORATION.—I enclose photograph of a font decorated with Adiantums, Asparagus, Lily of the Valley, Callas, Primula obconca, Pandanu-Veitchii, and double white Tulips. The occasion was a wedding in St. Nicholas' Church, Heythrop Park, Oxon. C. Collett. [The decorator availed himself of the peculiar shape of the font to produce the likeness of a floral basket, the handle lightly concaded with Asparagus, &c. At the base were white Arums, Pandanus Veitchii, &c., skilfully and effectively arranged. The general effect must have been good. En]

NEPENTHES. Mr. Rudolph speaks in his Monograph as if Nepenthes Rajuh. N. Edwardsiana, N. villosa, Hook. f. (non. N. villosa, Hort. = N. lanata = N. Veitchii, N. Lowii, and others had been introduced alive when discovered by Mr. Hugh Low in 1848. He has N. H. urryana, Eurbidge, as a hybrid, which it probably is, but not a garden hybrid; and he puts N. Burbidgei, Hook. f., under N. phyllamphora,

whereas it only exists dried at Kew, collected by Mr. Low and by myself, and we both consider it a distinct thing. It differs from all the species I know by its stem, which is triangular in section, and by its decurrent winged petioles, while the urns are most elegantly shaped, more like those of N. Rafflesiana than those of N. phyllamphora, and their colour and translucent texture is that of eggshell porcelain, ivory-white, with rose-pink blotches. As to the digestive power of the liquid there is no doubt; but, of course, there are bacteria there, as well both erobic and putrefactive, but they do not appear until after the peptonised fluid is exhausted, or its action checked by over-dilution with water. The formic acid of the ants caught helps to intensify the action of the digestive fluid, no doubt. The natives of North Borneo drink the pure secretion of the fresh young pitchers as a certain remedy for indigestion, which is a practical commentary as to its digestive action. Nearly all the species that are epiphytal grow on living trees covered with wet moss and other vegetation; but N. Veitchii is an exception, affecting dead trees or dead branches of living trees, and thus it lays itself out for catching ants, coleoptera, and hordes of other dead-wood boring and crawling insects, rather than the flying kinds that afford food to those with brightly-painted urns. It is curious to see insect eating birds, like woodpeckers and borers, searching the urns of N. Veitchii for prey—their natural food, while ignoring those flying insects caught by other kinds of Napanthes dlying insects caught by other kinds of Nepenthes, and which are searched by bee-enters and other insectivorous birds, and by rats. N. Veitchii clasps the stems of dead trees with some of its distichous leaves, in a different way to any other kind. F. W. Burbitge.

LAW NOTES.

MESSRS, MARSHALL BROS. r. CHARLES JOHNSTONE.

Sheriff Robertson, in the Aberdeen Sheriff Court, has just given decision on a point that is of some interest to dealers in fruit. Messrs. Marshall Brothers, Aberdeen, entered into a contract with Mr. Charles Johnstone, Regent Quay, Aberdeen, under which the latter agreed to purchase the produce of certain orchards of Pears which they had at their disposal. Under the contract the fruit was to be delivered to Mr. Johnstone as it arrived in Messis. Marshall's hands; but, when the season was over, Mr. Johnstone declined to pay for three lots on the ground that the first lot, although delivery hal been taken of it, was "disconform" to contract, and that he had refused the second two lots as disconform. Messrs, Marshall Brothers contended that the fruit was conform to contract, and that there had been in addition no "timeous" rejection. Sheriff Robertson has decided the case in favour of Messrs. Marshall Brothers, mainly on the ground that looking to the perishable nature of Pears, the first two lots were not timeously rejected and must be paid for, and that Mr. Johnstone had failed to prove that the third lot was disconform to sample and is bound to pay for it also. The first lot was delivered to Mr. Johnstone on or about October 16 or 19 last year, and rejection was not intimated till November 7; the second lot was tendered on October 24, but, though it was not taken into Mr. Johnstone's warehouse, the sheriff holds that he has failed to prove that he intimated its rejection as being "disconform" to sample until Nov. 7, which, in the sheriff's opinion, was far too late when dealing with such perishable articles as Pears. The third lot was tendered on Oct. 30, but was refused by Mr. Johnstone. The value of the s cond and third lots was £11 6s. 3d., but when they were eventually sold by Messrs, Marshall Brothers, they fetched only £1 17s. With regard to this, Sheriff Robertson says, in the note to his interlocutor— Apart from the poor price made by these two rejected lots, there is no sufficient evidence that they were in bad condition. As regards the small amount realised—and that, certainly, is remarkable and possibly hardly accounted for by the considerations suggested as to the weather, period of season, &c .if any of these Pears were such as the defender was entitled to reject, which I think is quite possible he has himself to blame if he suffer any undue loss on

that account—(1) because he did not reject them "timeously," and (2) because he did not have such an examination of the Pears made, and by such impartial persons, before rejection, as could satisfy any Court that the Pears were bad as against a statement to the contrary.

ST. LOUIS.

THE garden was very fortunate in the late cyclone. We lost about 200 trees-many very rare for this country, baving been secured in Europe years ago by Mr. Shaw. Several hundred trees are badly damaged -broken, but by judicious pruning will be almost restored in a few years. The hed plants were almost totally destroyed, but have mostly been replaced. The shrubbery fared better. Much damage was done to several of the buildings by their being unroofed and otherwise broken, but all can be repaired, and most of them are now. The damage is estimated at several thousand dollars, but restoration is possible in almost every ca-c. Compared with Lafayette Park and other parts of the city, we were indeed fortunate. Just now the wreckage is nearly all cleared away, and nothing remains to tell the story of devastation but the many thin spots throughout the garden. These are rapidly being replanted. All honour is due to Mr. Shaw that he left the finance of the garden in such admirable condition that restoration is not checked from that source-time only is required. C. H. Thompson, Acting Director.

NEW INVENTION.

PUMP FOR GARDEN WATERING, IRRIGATION, ETC.

A NOVELTY in garden watering apparatus has just been brought out by the makers of the well-known "Valuart" steum - pump, Messrs. Merryweather & Sons, of London. It has been constructed on lines laid down by Mr. Gibb, estate agent to Miss Alice de Rothschild, for that Lady's demesne at Eythorpe, Aylesbury, and appears to be well suited for its work. Complete with steam-boiler and four wheel carriage, it weighs about 3 cwt., and can therefore be easily wheele I about by one man. The pump is entirely of gun-metal, and may be used for chemicals for Hopwashing, removing blight, &c., without injury to basrel or valves. The capacity is from 20 to 3+ gillons per minute, and several hoses may be used simultaneously for lawn and garden watering. For watering rac comeses, cricket and tennis grounds, and for use on large nurseries and plantations, this pump is designed to sive the work of several men with hand pumping apparatus, while it is constructed in such a simple way, and has so few working parts, that any person of ordinary ability can easily work and keep it in order.

TRADE NOTICE.

MESSRY, JOHN SHARPE & SON, of Bardney and Reading, desire us to inform our readers that Mr. J. H. Millard ceased to represent their firm on June 30 last, and that Mr. A. E. Fountaine, of Ivy Farm, Caversham, will represent them in the South of England in the Branch Office, Town Hall Chambers, Reading.

CHESTER HORTICULTURAL S-OW .- A timely reminder may be given to our readers of the fact that a conference in connection with this exhibition is to be held in the Town Hall, Chester, on the evening of be held in the Town Hall, Chester, on the evening of August 1 next. His Grace the Duke of Westminster is to preside. Sir Trevor Lawrence, Bart, the Dean of Rochesfer, and Mr. F. W. Buredder, are to be the speakers, and surely with such a platform of leaders of horticulture, the success of the conference ought to be insured. Admission to the conference is free, and we hope everyone within reasonable distance of the ancient city who may love a flower, or possess a garden, will make a point of being present at the opening meeting of the show.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

July 14.—Dr. M. T. Masters (in the chair).

Picea Alcockiana Foliaceous Cones.—Mr. Mechan, of Germantown, Philadelphia, sent specimens showing the bracts of the cones becoming leaf-like, with the following observations :- "It represents a great struggle between the effort to plants. In some cases the branch and in others the cone plants. In some cases the branch and in others the cone nearly wins. The specimens are certainly due to the con-ditions of environment. There are about a dozen plants from 2 to 3 ft. high. Transplanted in the spring of 1895, it was with difficulty we got them through the drought and terrid heat of that exceptional season, the growth being but an inch or two. Other species of the order planted with them died absolutely."

Calodium, Variegated Leaf.—Mr. P. Crowley, of Waddon House, Croydon, sent a very curious example of dissociation of colours. The leaf was mainly of a pale pink colour, but one quarter, sharply marked off by two lines at right angles to one another, was white with green veios. The suggested interpretation was that the plant which bore it was a cross between two plants having the above peculiar ties respectively, and that the parental characters had become suddenly dissociated.

dissociated.

Crimum expense, var.—Rev. W. Shirley, of Southwick Parsonage, Farebam, sent a flower, which proved to be a pale variety of this species. He remarks that he has succeeded in crossing it with C. Moorei (male parent), having raised four plants, but was unable to effect a cross the reverse way.

Parrot Talips not Seeding.—In response to an inquiry from the Secretary, Mr. Barr writes:—"We have been making inquiries over Holland, and are informed that the Dutch growers de not remember to have ever seen seed to ripen on these Tulips." It was suggested that it would be worth while experimenting with them next year, to see if seed could be

procured by artificial pollination.

Fungus on Primulo.—A curious fungus upon leaves of Primula was sent by Mr. W. Hall, the superintendent of Parks, Sunderland. It was forwarded to Kew for further

Wild Chamomile Fatal to Lambs.—It was reported from the Bedford Woburn Estate, that this very common plant, Matricaria Chamomilla, had proved highly injurious to sheep and Lumbs, several hiving died in consequence of having eaten it. The plant has never been suspected of having dangerous qualities, though the flowers are naturally rather. acrid and bitter, in consequence of the presence of the essential oil which they contain. If the report be true, it may be suggested that the intense heat may have intensified these properties, as is well known to be the case with Artemisias, &c., in subtropical countries.

DEVON AND EXETER GARDENERS' ASSOCIATION.

JCLY 15.—This holy of horticulturists held their fifth summer outing on St. Swithin's Day, when about seventyfive members and friends answered to the roll-call,

Three well-appointed brakese miled the party, passing along the Topsham Road, and the old site of Messrs. Veitch's famous nurseries there, crossing the Exe at teumtess Wear, and leaving the Forest-tree Nurseries of Robert Veitch & Son at Exminst r on the right.

POWDERHAM PARK,

"Where Eve meets carled Kenne with kind embrace, In crystal arms they clip fair Powderham's place,

was reached, and the visitors were received by Mr. D. C. Powell, the lessee of the gardens. The first trees to be noted were some grand Elms of about 130 feet in height, forming an unbroken line, and leading on to the Cedar Avenne, which is formed of a number of particularly healthy and well-furnished Cedars. Leaving the main drive, the ascent was made to the foot of the Belvedere Tower, which is the county of the leaving the form to the leave the terms of the leave the second was made to the foot of the Belvedere Tower, which ascent was made to the foot of the Belvedere Tower, which forms one of the landmarks of the county. From here the view is magnificent. Across the estuary of the Exe is seen the timber-crowned Woodbury Hill, the bold ridge terminating at Sidmouth Gap, and the many ancestral homes nestling in the bosom of the estuary between. To the south is the once important ship-building town of Topsham; Nutwell Court, the home of the Drakes; and in the distance Hayes Barton, the hirthplace of Sir Walter Raleigh. The coast line, with Lympstone and Exmouth on the left, and Starcross and Dawlish on the right, forms a beautiful foreground to the picture. foreground to the picture.

Following a winding path through the woods, the descent was made to the American garden, in which were many subjects of interest. Here was one of the earliest specimens of Camellia japonica, which it is supposed was planted by Sir Joseph Banks, when on a visit to Powderham, towards the end of the last century. Here also was a fine C. alba plens, from which, a few years ago, over 600 blooms were cut the day before Easter. These are right out in the open. A noble specimen of Eucalyptus ceceifora, about 70 foot hi h was bested. It bed just record out of flower and was full of hard spectmen of Eucalyptus cocciters, about 10 feet in it was noted. It had just passed out of flower, and was full of hud for next year's flowering. One or two fine Tulip trees were observed, one of 120 feet, just passing out of bloom. Pinus excelsa, with hundreds of its curious Cucumber-like cones hanging from it; Abies Smithiana, with drooping branch-

lets of 6 feet long; Abies Nordmanniana, Cephalotavus lets of 6 feet long; Abres Nordmanniana, Cephanotavus drupacea, with its large Plum-like berries; a grand specimen of the Cork Oak (Quercus suber, and an Ivy with a stem I foot in diameter, clinging to an Elm, and which had assumed the colour and furrowed bark of its foster-parent. Hydrangeas of a bright blue colour, some fine Nymphras in the pond, and other interesting subjects were also pointed out by Mr. Powell. Passing through the vineries, in which were some fine examples of successful Vine culture, the eastle was reached, and the brakes re-entered, and the journey continued, this time along the coast, through the towns of Starcross and Dawlish to Teignmouth. The rendezvous at this place was

EASTOTUCE

the seat of Col. Halford Thomson, J.P. As time was speeding along, the excursionists, under the guidance of their host at once started on their tour of inspection. Colonel Thompson, being the inventor and patentee of Jadoo fibre and Jadoo liquid, and the Chairman of the Jadoo Limited, much interest was felt in the experiments with these materials at Eastchil. The conservatories in which Jadoo alone is now used were full of plants in the most per-feet health, abundance of bloom and brilliancy of colour being most marked. The subjects treated were Begonias, Camas, Fuchsias, Streptocarpus, Crotons, Colcus, Dracenas, Aralia Veitchii, Grevilleas, Adiantum Farleyense, A. gracill.mum, Gymnogramma schizophylla gloriosa, Asparagus Sprengeri, Azaleas, Cyc'amen, &c. Of the complete success of the material for conservatory work there could be no doubt.

Some fruit trees (Apples and Pears) in pots, growing in Jadoo, were next noticed, and here were small trees bearing very fine fruit in abundance. Then some Potatos were dug which had been planted in a layer of Jadoo-tibre and moulded-up with ordinary garden-earth soil. The tubers came up almost perfect in every respect the skin was soft and clear, and many tubers were, as they were dug, fit for the show-table An adjournment was now nt for the show-table. An adjournment was now made to the lawn, where an excellent luncheon was served. When the enjoyable all fresco feast was concluded, Mr. Hope proposed the health of Colonel Halford Thompson, and in doing so, referred to the successes he had achieved years ago as a Pansy amateur when he went up to Edinburgh and "bearded the Douglas in his hold." Since then he had gone on with his favourite pastime of gardening, and latterly he had thrown his entire offerts into his experiments with Jadoo, with what success they had that day in the ample evidence around them. The toast was warmly received, and Col. Thompson, in reply, gave some interesting facts in connection with the new material, which was being exported in large quantities, and for which the home cemand was steadily increasing. Jadon must, the Colonel said, stand or fall by its merits, and his been so extensive and exacting, and so universally sucexperiments with it, both at home and on the Continent, had cessful, that he was well content it should be so advantages of its use were its lightness for pot-plants, its requiring less water, its greater cleanliness, its combining in itself a perfect plant-food, the greater floriferousness and brilliancy of colour in the foliage and flowers of plants grown

in it.

A visit was next paid to the Jadoo factory A visit was next pand to the state lateraly on the quay, where the process of boiling, and pressing, and fermenting, and drying, was fully explained and demonstrated by the workmen. Mes-rs. C. T. K. Roberts and J. Littlejohn, Directors of the Company, were there and J. Littiejohn, Directors of the company, were there to receive the visitors. The journey was then resumed, and after a delightful drive over the high h.lls commanding Torlay, Torquay, "the Queen of the West" was reached. After tea, the party under the guidance of Mr. H. A. Garrett, Botongh Surveyer, and Mr. Dyer, the superintendent of the public grounds, inspected the public gardens. Special attention was here invited to reputed tender plants which were found to thrive on the terrace gardens. The rocks in the background are almost perpendicular, forming a shelter from the north and east winds. The following plants have stood several winters there without injury: -Large specimens of Palms, including Latania borbonica, Chamerops excelsa, C. Fortunei and C. humilis; Dracænas, Phormiums, Camellias, Crimums, Eucalyptus, Callas, Ahutilons, Acacias, Agaves, Araucarias, Azaleas, Brugmansias, Cannas, Citrus, Daphne, Ericas, Fuchsias, Sparmanuia, Oleanders, Veronicas, Olives, Cactus, Yuccas, Aralias, Bamboos, Spirasas, Loquat, Magnolias, Myrtle, Cestrum, Ricinus, Mesembryanthemums, Imatophyllum, and several others. The rocks are covered with climbers, including Clematis, Ampelopsis, Climthus, Passidora, Solanums, Plumbago, Habrothamnus, Physianthus, Stauntonia latitolia, Tropecolums, Maréchal Niel and other Tea Roses, &c. The beds and borders along the whole length of the garden (about 430 yards) are planted with choice Begonias, Fuch-ias, Heliotrope, Felargeniums, Coleus, Echeverias, and Dactylis, Shrubs in great varieties are planted throughout the gardens, also a fine line of young Dracenas. The shrubs include Veronicas, Olearias, Ceanothus, Escallonias, Pittosporum, Rhededendron, Cistus, Hyperieum, Eleagnus, Coronilla, Choisya, Diplopappus, and a number of others.

Several of the party then proceeded on the invitation of Dr. Hamilton Ramsay, president of the Torquay Gardeners' Association, to Duncan House, in front of which is a fine collection of sub-tropical plants. Latania borbonica and collection of sub-trepical plants Latania borbonica and Chamsrops excelsa have stood out for years here, and two specimens for over twenty-four winters. Eulalia febrina, Aralia Sieboldi, Phormium tenax variegata, Spiraca ariaefolia, Myrtles, Bamboos, Pampas, and other

picturesque subjects were planted in artistic groups plettresque stojects were planted in After perambulatiog the grounds, the stalwart and handsome old Scotsman led the way attended by his private piper in full highland costume, the visitors following, into the drawing-room where costume, the visitors following, into the drawing-room where cake and wine was served. The piper (McInnes), is a descendant of Prince Charlie's piper, and is proud of the fact that his ancestor received 150 lashes for ceneraling his royal master, the "bonnie Prince Charlie." Bidding farewell to our entertaining and recoveried by the "bonne Prince Charlie." Bidding larewell to our enter-taining and very genial host, the return journey was com-menced, and after a long drive by way of Newton Abbot, Chudleigh, and Haldon Hill, the "Ever Faithful" city was reached a little beyond the witching hour.

ALTRINCHAM AND BOWDON HORTICULTURAL.

July 17 1s -The annual exhibition of this society was held in the Athletic Grounds, Devisdale, Bowdon, on the above dates. Spacious marquees were erected, and the fine weather which has previded during the month, made it exceedingly pleasant for promeniders, the turf being in good condition; and there was a goodly assemblage of visitors. The committee offer very good prizes for plants, cut flowers, fruits, and veget ibles, and both anateurs and cottagers enter with spirit into the competition. What largely helps to bring in funds, is the series of sports taking place on the last day of the exinbition, and the sales ription-list amounting to about £140. The show of plants in pots was good and the competition in the class for collections arranged for effect in oval and circular groups was keenly contested. The herbaccons plants in pots, particularly the group of twe ve shown by Mr. JA2. Smith, Bowlon, were large, well leaved and flowered, showing what can be done with this class of plants, and justifying the general encomiums bestowed upon the group by both gardeners and amatours. The cut flowers formed a large exhibition, and the fruit for the season was above the average of that seen at local shows, while the vegetables were also a large and generally creditable lot.

For the large collections of plants arranged for effect, Sam HENCHLIFE, Esq. and Aron Hoso, Esq., were placed equal 1st. In the former collection were some good Palms, same bright enfoured Crotons and Coleus, with the excenery obtained from miscellaneous Ferns, a fine edging of dium argyrites, and a few trichids, comprising Cattleya Mendeli, Odontoglossum crispain, several Cypropodoums (Lawrenceanum being notably good), one or two well-flowered specimens of Brasia verues as, which told well in the group, and several other good things.
In Mr. Hogo's collection the Contains were well-grown and

particularly bright, and what the flowering plants were lacking in, was more than much up by an effective arrange-Mr. H. T. GADDUM and Mr. HALL also showed well in this group.

In the circular groups, Mr. 1, S. Haworth, Dunham

in the circular groups, Mr. 1. S. Hawberth, Dunham Mersey, and Mr. E. Brathy had the premier lots.

For six stove and greenhouse plunts, Mr. Brathy, Mr. Heschthee, and Mr. J. Hawberth had well-grown, well-flowered plants. Dr. More and Mrs. Otherend had wellgrown Ferns Mr. Henengiff E hol a lot of good Orchids, and his Cypropedium Roths halinmum was a fine variety

Mr. J.s. SMITH twelve bethere is plants, above specially noticed, were a remarkably even group, prominent in it being a plant of Spirea aruners, with beautiful feathery, arching plumes.

arching plumes.

In all the twenty-seven open classes there was a fairly good representation. The cut R ses, particularly these from Mr. Cras. Bereas-s, Plumbley, were good, fresh, fairly sized, the best being Pierre Notting, Victor Verdier, Marie Banmann, and Mrs. Laing. Mrs. Rayser, Marple; Mr. Hatt, Hale; and Mr. Brown, Heaton Mersey, taking premier positions in the priory classes. positions in the various classes

positions in the various classes Mr. C. E. N. Galdum had the best collection of fruit, consisting of Grapes, Peaches, Melons, &c. Mr. Watterson had well finished, very good bunches of Black Hamburgh and Foster's Seedling Grapes.

Dr. Moir and Mr. Gill, Ashton on Mersey, had excellent

collections of vegetables.

NON-COMPETITIVE EXHIBITS.

Mr. John Robson, nurseryman, Bowdon, put up an effective group of pot-plants, and his collection of herbaceous cut

flowers was varied and showy.

Messrs, Clibran & Son, Altrincham, had also a large lot of border flowers, comprising Roses, Lilies, Gaillardias,

Dicksons, Chester, had a charming lot of Tea and Noisette Roses, among which several novelties were observed.

Messrs, Caldwell, Knutsforl, had a grand array of out Sweet Peas in very numerous shides of colour

Mr. Harwoon put up a good, send-circular group of plants. The Messrs, Horkins, Knutsford, had a varied and elem

TIBSHELF HORTICULTURAL.

JULY 21,-The Tib-helf Floral and Horticultural Society held its show on the above d to on the Cricket Ground, and the weather being beautifully fine, there was a large attendance of visitors. In connection with the flower show is a Rose show, under the rules of the National Rose Society, and this feature is becoming increasingly important. Indeed the judges on Tuesday declared the collection of Roses brought together to be the finest seen in the United Kingdom this year, notwithstanding the fact that the season is getting on. The National Society's Gold Model was awa ded to Messrs. HARKNESS & Son, Bedale, Yorkshire. The prizelist for Roses was as follows :-

R0578.

Seventy two blooms, fifty distinct varieties.—ist, Messrs, HARKNESS & SONS, Bedale; 2nd, Messrs, Merryweather & SONS, Southwell; 3rd, Messrs, Dickson & SON, Newtownards, co. Down; 4th and 5th, Messrs Cocker & Sons, Morning field Nurseries, Aberdeen.

Forty-eight blooms, distinct varieties. — 1st, Messes. Dickson & Son; 2nd and 3rd, Messes. Cocker & Son; 4th. Messes. Merryweather & Sons; 5th Messes. Macr & Son; 6th, Messes. Harkness & Sons; 7th, Messes. Townsend

Thirty six blooms, distinct varieties. - Equal 1st, Messrs, CORDER SON and Messrs, Mack & Son; 2rd, Messrs, 10rd, Son & Son and Messrs, Cocker & Son; 2rd, Messrs, Merry, Son & Son; 4th, Messrs, Cocker & Son; 5th, Messrs, Merry, WEATHER & SON; 6th, Messrs. HARKNE'S & SONS.

Twenty-four blooms.—1st, Mr H V. Machin, Worksop; 2nd, Mr. W. Boyes, Derby -rl, Mr. Whitle, Leicester; 4t., Mr. R. E. West; 5th, Mr. Monnis.

Bighten distinct varieties -1st, Mr. Whiltle: 2nd, Mr. R. E. West; 3rd, Mr. Morris; 3rd, Mr. Braton Ry. Twelve distinct varieties. -1st, Mr. Whilt. E; 2nd, Mr. S.

PRICE; ort, Mr. R. E. WEST; 4th, Mr. S. ModeRis.

Three large marquees were required for the accommodation of the exhibits, but there was a slight fidling off, owing to the dry weather, in the number of exhibits from ottigers and artisans. The total number of exhibits, nevertheless, was in excess of last year. The groups of plants, occupying a space of 200 feet, were exceptionally fine; the middle tent, in which these were, presenting a beautiful sight. Nine prizes were offered, the highest amount being ±15.

Mr. J. Ward, gr. to Mr. T. H. Oakas, J.P., of Riddings House, Alfreton, is always a formidable competitor at Clay Cross and Dibshelf, and, indeed, at any show in the Midlands in this particular department of shows. He carried off the 1st prize, as he has done six or seven years in succession at Tu shelf, and as he invariably does at Chy (ross,

Green, -It was satisfactory to note that groups were of a norm excellence than is usually the case, and the point upon which the judgeshad to attach the greatest importance in giving their awards was not so much the difference in artistic taste displayed in the groupings, but the quality of the component parts of the groups. In Mr. Want's group every individual plant was a perfect specimen of its kind. The specialty consisted of drooping curly Crotons, which are seldom seen with such colour. The winner of the fth prize, it should be stated, is a working collier, living at Thishelf, and is a well-known prize-taker in the district. The following is a list of the prize takers in this section: 1st, The following is a list of the prize-takers in this section: 1st, Mr. J. Ward, gardener at Riddings House, Alfreton: 2nd, Mr. J. Edmonds, gardener to the Duke of St. Albans; 2nd, Mr. C. J. Mar. Nottingham: 4th, Mr. W. Haslun, Harstoft; 5th, Mr. William Shakespeare, Tibshelf, 6th, Mr. Webb, gardener to Viscountess Ossington, Ketham Hall; 7th, Mr. Kemp, gr. to Mr. J. J. Chambers, Tibshelf (the group in the grant part of the

Other prizes in the open class went to the following :-Ferns, collection of six. 1st, Mr. J. Warn; and, Mr. J.

Ferns, collection of six, 1st, Mr. J. Warn; 1nd, Mr. J. Nelson, 3rd, Mr. W. Keme; 4th, Mr. T. Butler.
Zonal Pelargoniums, six varieties,—ist, Mr. T. Butler.
Frehsias, six varieties; 1st, Mr. J. Swaywick, garlener at Sherwood Lodge, Nottingham; 2nd, Mr. W. Shakesheare, Tibshelf, Orchids, collection of six; 1st, Mr. C. J. Mre, Daybrook Nurseries. Six plants for table decoration; 1st, Mr. J.
Enuryris, gardener at Bestwood Hall; 2nd, Mr. C. J. Mee; Mr. M. W. R. Bandard of the mers, but Mr. R. J. Weith. Browners, Six plants for table decoration; 1st, Mr. J. Ermunder, gardener at Best wood Hall; 2nd, Mr. C. J. Mee; 3rd, Mr. J. Ward. Bouquet of the wers: 1st, Messrs, Johnson & Wheeler, Chesterfield. Vase of flowers: 1st, Mr. J. Ward; 2nd, Mr. St. Johnson & Wheeler. Collection of cut flower; 1st, Mr. T. J. Nelson; 2nd, Mr. J. Verbenas: 1st, Mr T BUILER; 2nd, Mr S PRICE.

The Secretary, Mr. R. Harrison, on Juesday attained his indicative as the secretary of the Society, which under his able guidance has attained dimensions of a surprising

SURREY FLORICULTURAL.

JULY 22. -Though the name of this society connects it with the county, the exhibition is a purely local one, and as it is only open to exhibitors who are members of the society, to compete for prizes, the display should not be compared with many other exhibitions in this county where there is no such restriction. The fifty-second annual exhibition was held on the above date in the grounds of Brockwell Hall, adjoining Brockwell Park, and close to Herne Hill Bailway Station.

There were numerous classes, but the competition was by no means keen. Details concerning a few of the principal classes are appended. Amongst some of the special prizes were several offered to exhibitors of the best plants which had been washed by a certain stap!

Mr. J. Lambert, gr. to H. W. Segelcke, Esq., Elfindale Lodge, Herne Hill, had the best collection of six folinge plants, showing three Crotons and a plant each of Hyophorbe Intescens, Aloeasia in icrorhiza, and Anthurium crystallimum. The same exhibitor was 1st for six Fuchsias, and for six

distinct varieties of Ferns; and 2nd for four store or green-

Six plants suitable for table decoration were lest shown by Mr. A. A. Rofe, gr. to Mrs. Colr., Elmfield, Streatham. Mr. A. A. Rofe had also the best half-dozen of Petunias and was 2nd for half-a dozen plants of Co'cus; and, in addition, 1st for six Caladiums, and 2nd for six Begonias in flower. The 1st prize in the last-named class was won by Mr. T. Pearce, gr. to S. G. C. Sanson, Esq., Leigham Holme, Leighton Court Road. This exhibitor won also for a group m also for a group of miscellaneous plants, being followed by Mr J. Lambert Mr. J. Lambert won for six Draconas.

Mr. Rore, with two good bunches of Black Hamburgh, was 1st for black Grapes; and Mrs. Holt, Waratah, Chisle-Mass 18t 10t of alex Grapes, and the Mass with Museat of Alexandria, won for white Grapes.

Messes, JNO. Laine & Sons, Forest Hill, London, S.E.

helped towards the display by an exhibit of their plant specialties, and Mr. Rost. Newl, Trinity Road, Wandsworth, had a large group of miscellaneous plants (stove and greenhouse), and cut Roses, &c.

BECKENHAM HORTICULTURAL.

July 22 -The annual exhibition of the Beckenham Society was held on the above date in the Athletic Grounds under auspicious circumstances. Considerable interest is taken in the annual event by the people of the district, and Beckenham itself is made brighter for the occasion by the Beckennan itself is made brighter for the occasion by the dls-play of bunting in the more conspicuous places. The three good sized tents were well filled, and the number of competitive classes was large, a great many of these being for the encouragement of "single-handed" gardeners, amateurs and cottagers. In connection with the last named section of exhibitors, the chairman of the district council who occupied the exhibition professed to the foot that this leads to the foot that the last is the last is the foot that the last is who opened the exhibition referred to the fact that this body was now preparing for the benefit of Beckenham residents about ten acres of land to be used as allotments, and we hope about ten acres of that the site chosen is a convenient one, in order that the most use possible may be made of it. In the open classes it is desirable that more competitors should engage, for, as will be seen from the details below, the number of prize winners is not quite satisfactory. Several varieties of plants were well shown, and none better than Achimenes and tuberous rooted Begonias. We are unable to give details respecting the whole of the classes, and the following refer mostly to those open to all competitors The arrangements were good, and a word of praise is carned by the energetic honorary secretary, Mr. T. W. Thornton, who for the past few years

secretary, 311 1. 11. Institute that he Society.

The groups of plants arranged for effect being only upon a space loft, by 5ft., there was not scope for a great effort. The arrangement to which was awarded the 1st prize, was exhibited by Mr. T. Crosswell, gr. to W. M. Bellivant, Esq. Homewood, and consisted of a groundwork of Ferns, among which were interspersed Fuchias, some very fine Gloxinias, Crotons, Caladiums, and a few Palms. The 2nd proze was taken by Mr. M. Webster, gr. to E. J. Paesto J. Esq. In taken by Mr. M. Webster, gr. to E. J. Presio.; Esq. In this exhibit the plants used were rather too large for a range-ment in so smull a space. Table plants, though exhibited by two competitors only, were very good from Mr. J. Munro, gr. to J. L. Buckwall, Esq., Langley Cault, his Crotons Aighurthensis and Domein being of commendable endour. Mr. M. Webster, gr. to E. J. Presion, Esq., Kelsey Cottage, 2002. 2014.

was 2ml

Mr. J. MCSRO had the best c dection of three flowering stove or greenhouse plants, showing Plumbago capensis, Allamanda Hendersoni, and Stephanotis floribunda Mr M Weester was 2nd.

Mr. F. G. Cogger, gr. to J. Norwood, Esq., Pembury

Lodge, was 1st for three foliage plants, staging two Caladianas and one Croton; Mr. J. Musico being 2nd.

Eight miscellaneous plants were exhibited best by Mr. M. WEBSTER, in whose collection was noticed a pretty plant of Cissus discolor and two graceful Palms. Mr J. Menro's 2nd prize exhibit contained two nice Crotons

The best single specimen plant was a cepital one of Plumbago capensis, shown by Mr. M. Webster; the Anthurium Scherzerianum, by which Mr J MUNRO was 2nd, contained a large number of flowers.

Ferns were of commendable quality, the best collection of Dur plants being shown by Mr. F. G. Coccer, and the 2nd prize was taken by Mr. H. Cooper, gr. to C. W. Harrisson,

Esq Whitmores. The few exhibits of tuberous-rooted Regonias deserve special commendation. The collection of four specimens with which Mr. T. Caosswill, obtained 1st prize was capital; three of the plants were double-flowered, and the remaining one a single variety, the last-named being the most effective of them all. Mr. F. W. Price, gr. to H. C. CROWINER, Esq., Broulelyst, was 2nd, and included all double-flowered

Mr T Chosswill, had the four best Puchsias, and Mr M WEBSTER was 2nd In this latter collection the plants were but sparsely bloomed.

t'olens are usually very pretty at Beckenham, and on the present occasion some brightly coloured specimens were stuged, though of moderate size. Mr. J. Musico was 1st again here, and Mr M WEBSTER 2nd.

Gloxinias gave Mr. T. Chosswell mother opportunity to core 1st, and he had a very satisfactory collection of six plants, which appeared, however, to have come from too hot Mr. II. Cooper was 2nd with very much in atmosphere. Mr. II. Cooper was 2nd with very much smaller plants, and Mr. F. W. Price, gr. to II. C. CROWTHER Esq , Broadelyst, was a good 3rd.

For Potumas Mr. Webster staged most successfully, and te was followed by Mr. J. Galley, gr. to J. Hoston, Esq., Haynes House, and Mr. J. Munso respectively.

Achimenes were very fine, and the collection of four plants shown by Mr. W. Turle, gr. to A. H. Baker, Esq., Elderslie, was worthy of much praise, a plant of the bright flowered variety Dazzle covered with blossoms was very effective. Mr. H. Cooper was 2nd, and Mr. F. Smith, gr. to M. John-

son, Esq., Moat Lodge, 3rd.
Mr. H. Cooper had the best Lycopodiums, but these were not exhibited largely.

Cut Roses in a collection of twelve blooms were best from

Mr. A. C. Gifford, Cornwalls, Tennison Road, S. Norwood. The best Grapes were from Mr. W. Taylor, gr. to C. Bayle. Esq., Tewkesbury Lodge, Forest Hill, who showed two bunches of Black Hambro; Mr. J. Amery, gr. to F E LIEBRICH, Esq., was 2nd.

There were several collections of six Pelargeniums in bloom, and amongst these the collection from Mr F G Concer was awarded 1st prize.

The Beckenham people have always a model garden or two

prize for this class was won by Mr. A. H. Burnos, Broadprize for this class we won by Mr. A. If Berroa, most stairs Stables, whose exhibit evidenced the possession of a certain amount of ingenuity.

The table decorations were good, and the 1st prize in one case went to Mr. T. Hoasman, Station Conservatory, Beckenbam , and in the other to Miss Edith Higginsorrow, Vernon House, and Miss E M Hewlett, Elmhurst, equally

MISCELLANEOUS EXHIBITS.

There were several honorary exhibits of a good character Messrs. H. Cannell. & Sons treated the Beckenham people to a view of some of their Cannas, and Messrs. J.No. Lynno & Son, Forest Hill, had a large group in which were Caladiums, Begonias, Orchids, and other choice plants, also cut Roses and hardy flowers.

The Agricultural and Horticultural Association had a number of bardy flowers displayed, and from Reid's Nursery Beckenham Hill, were shown cut flowers of Cannas and Carnations Mr E M RANDALL, Ruilway Br dge, Breken ham, had floral designs.

Mr. JNO R Box, West Wickham and Croydon, exhibited an oval group of triberous Begonias upon the grass, backed and faced with ornumental foliage plants of a miscellaneous

Messrs Jno Perio & Sons, Roupell Park Norseri s. Norwood Road, London staged a small group of miscell incous plants, chiefly remarkable for some choice Caladiums, and a well flowered Hyd angea paniculat i

THE NATIONAL CARNATION AND PICOTEE

(Southern Section).

July 20 -It was the presence of the exhibits brought by the Midland growers which helped so much to make up a Show worthy of the Southern Section of the National Carnation and Picotee Society. The hot, dry weather brought on the blooms of the southern growers unusually early, and they were price tie dly unable to exhibit - As Mr. Smith said at the luncheon, no one, not even Zwikiel, could alter the weather; and he thought, in the face of the experience of the past two years, that for the future the show should be held a week earlier, say about the 15th of July. The Birmingham growers were favoured by having a season a week later, and they had Larger, fuller, and fresher blooms than could be cut in the South Still, the everage of quality was below that of last year: some of the blooms were thin in substance, and lacking colour. The Selfs were in a few cases very fine; and the yellow grounds much better than might have been expected

CARNATIONS

With twenty tom Idooms of Carnations, not fewer than With twenty tom blooms of Carnations, not fewer than twelve varieties, Mr. R. Syderbaan, Birmingham, repeated his victory of last year by taking the 1st prize. He had good blooms of C. B. Loud Salisbury, P. F. George Melville, R. F. Thalia, P. P. B. Win Skirving, P. F. Gordon Lewis, R. F. Mrs. Rowan, C. B. J. D. Hextall, R. F. Thalia, S. F. Guardsmun, C. B. Mrs. Burgess, S. B. Robert Lord, S. B. Robert Houlgrave, R. F. Rosa Mundi, P. F. Agricola, C. B. J. S. Hedderley, P. P. B. Edith Arme, and C. R. Master, Frank. Hedderley, P. P. B. Edith Anne, and C. B. Master Fred; Headerley, F. F. B. Eatth Anne, and C. B. Master Fred; 2nd, Messrs. Throuson & Co., Nurserymen, Sparkhill, Birmingham, who had varieties differing from the foregoing, viz., F. P. Burline, S. F. Sportsman, R. F. Cristi-galli, S. B. C. H. Herbert, S. F. Flamingo, P. P. B. R. Badey, P. F. James Douglas, and C. B. Jos. Crossland. Mr. Martin Rowan, Clapham, was 3rd, several other prizes being grounded in the analytic following classes. awarded in this and the following classes

With twelve blooms, Mr. Joe Edwards, Blockley, Man-

With twelve bloods, Mr. Job Elwards, Physics, Sance Chester, was 1st, braving C. B. J. S. Helderly, S. B. Evan Edwards new bulliant in colour; P. F. Gordon Lewis, S. B. Othello, R. F. Mrs. Rowan, P. F. Harmony, S. F. Sportsman, C. B. Stanley, C. E. Master Fred, S. B. Robert Houlgrave, P. P. B. Sepine Llewelyn, and S. B. Admiral Curzon. 2nd, Mr. J. Mr. A. R. Brown, H. dsworth, Bermingham. 3rd, Mr. J. Brocki figures, Moston, Manchester.

BROCKLEHBERR, Moston, Manchester.
With six blooms, Mr. A. Greenfeed, Sutten, Suffey, was 1st, having C. B. J. D. Hextall, S. B. Robert Lord, S. F. Sportsman, C. B. J. Simonit, P. P. B. Phoebe, and P. F. Charles Benwood. Mr. T. E. Henwood, Reading, was 2nd, and Mr T Assuss, Brill, 3rd.

PICOTEES

With twenty-four Picotees, in not fewer thin twelve vanieties, Mr. R. Sydenham was again 1st, having elean blooms of Ro. E. Lady Lonisa, L. Red E. Lena, Red E Garymede, L. P. E. Lady Lonisa, L. Red E. Lena, Red E. Garymede, L. P. E. Mrs. Kingston, L. P. E. Thomas William, Red E. Mrs. Wilson, L. P. E. Jessie, Ro. E. Little Phil, L. Ro. E. Nelhe, P. E. Muriel, Ro. E. Mrs. Payne, P. E. Esther, L. Red E. Mrs. Gorton, L. Ro. E. Favourite, R. E. Mrs. Oarnetter, T. J. Mrs. Garton, L. Ro. E. Favourite, P. E. Mrs. Openshaw, Ro. E. Mrs. Coldridge, L. P. E. Pride of Leyton, L. Red E. Lona, and P. E. Amy Robsart. 2nd, Mr. A. W. Jones, Handsworth, Birmingham, whose finest blooms were Red E. Mrs. Wilson, L. P. E. Esther, Ro. E. Little Phil, Ro E. Norman Carr, L. P. E. Mrs. Gorton, Red E. Brunette, Red. E. Isabel'a Lakin, and L. P. E. Somerhill. 3rd, Messrs, Thomson & Co.
With twelve blooms Mr. J. Euwards took the first prize,

having differing from the foregoing Polly Brazil, Ro. E. Edith Dombrain, Red E. John Smith, Ro. E. Mrs. Sharpe, 2nd, Mr. A. R. BROWN, Handsworth, and P. E. Muriel. Birmingham. 3rd, Mr. B. Simonte, Brill.

With six blooms, Mr. C. Hardega, Ash, Sandwich, was

1st; M. T. E. HENWOOD, 2nd; and Mr. T. Anstiss, 3rd.

SELF CARNATIONS

Were bright and pleasing. The dark and light tints mixed

together made the stand very attractive.

With twenty-four blooms, Mr. C. Blick, gr. to Mr. R.
SMITH, Hayes Common, Kent, was 1st, having the following fine varieties of his own raising: Shades of crimson and red Salisbury, Brown Bess, Beacon, Banner, Warrior, Roma, Sansury, Brown Bess, Beacon, Banner, Warner, Kona, and Prince Charlie; rose, Regalia, Sappho, Mrs. Gascoigne, and Winifred; buff. Dalkeith and Cinnamon; yellow, tilda, Britumia, and J. H. Stnart, blush, Tredegone, Her Grace, and Abney; white, Lady Ridley. 2nd, Mr. J. Dattoras, Bookham, Surrey, who had Zudok, a large purple murson self, Mrs. Eric Hambro, Diama, a fine pink self, Duke Orleans, Endoxia, Miss E. Terry, and Seedlings 3rd, Mr J. WALKER, Thome

With twelve Selfs, Mr. A. R. Brown was placed 1st. Chief among his blooms were Eudoxia, Britannia, Mrs. Fric Humbro, Mrs. Fred, Hayes' Scarlet, Mephisto, Germania, Braw Lass, Lady Ridley, Topsy, and Sadek. Mr. J. Edwards was 2nd he having Mangunian, a very fine maroon self. Rose Celestial, Uncle Tom, Ruby, President, &c 3rd, Mr. R. STRENHAM.

With six blooms Mr. T E HENWO in was 1st, and Mr. C. Phatirs, Bracknell, 2nd.

FANCIES

Very fine indeed were the fancy Carnations. Especially a stand of twenty-four blooms, mainly of his own raising, shown by Mr. M. SMIII, such as Roland, Perseus, Aashti, El Dorado, Naseby, Flamma, Lorna Doone, Nestor, Leopold, Regent, Czurina, President Curnot, Melba, Khedive, Ohver, Figaro, Dalgetty, Hildage, a new and very distinct variety, bright gold ground, flaked on the edges with crimson and maroon; Aureola, pale ground, heavily edged with reddish crimson; The Buron, in the way of Aureola, Bertie, and Evening Star.—Mr. J. Dotolas was 2nd, having Romu his, Caral, Cardinal Wolsey, Mogul, Old Coin, and Seedlings. and M. J. WALKER, Thame.

With twelve funcies, Messrs Thomeon & Co. first with good ldeoms of Mrs. A. Tate, Brocklin, Cato, Gold Crest, Mrs. W. Spencer, Almira, Janira, Monarch, The Dey, Stadtrath Bail, and Cardinal Wolsey. 2nd Mr. A. J. Synders, bis collection being for the most part scedlings.

With six funcies Mr. J. Enw vices was 1st, he having in good form Almira, Stadtrath Bail, Cardinal Wolsey, Ronnlus, Yellow-hammer, and Mrs. Hyrr. Mr. A. R. Brown was 2nd and Mr. C. HARDEN, Srd.

YELLOW GROUNDS.

Were also a fine feature, despite the heat. The best twelve e one from Mr. R. Sylenuan, who had Ladas, Mrs. Gooden, Florric Henwood, Agnes Chambers, Countess of Jersey, Mrs R. Sydenham, and Mrs. Donglas, duplicates being permitted. SMITH was 2nd, having Voltaire, May Colden Eagle, Professor, His Excellency, Fortune, Monican Dervish, Hygeia, and Mrs Tremayne. 3rd, Messrs. Thomsox & Co, who had an unnuned Seedling of high quality with Mr A W Jones was 1st, having capital flowers six blooms of Mrs. Gooden, Countess of Jersey, Mrs. R. Sydenham, Mrs. Douglas, Ladas, and President Carnot. Mr. A. R. Brown was 2nd, and Mr. H. W. Wegnelm, Teignmouth, 3rd.

SINGLE BLOOMS

of Carnations were as usual very good, the leading S. Bs. were Robert Houlgrave, C. H. Herbert, and Robert Lord. J. S. Hedderly, Master Freds., and J. D. Hextall. P P Bs. William Skirving, this variety being so good as to take all the prizes P Fs. Gordon Lewis, Charles Henwood and James Douglas S Fs. Sportsman and Guardsman. R. Fs. Mrs. Gum, Mrs. Rowan and Thalia. Selfs-white, R. Fs. Mrs. Gunn, Mrs. Rowan and Thalia. Selfs white, Mrs. Lee a very fine northern variety: Pearl and Mrs. Muir. rose or pink, Ruby, Macclesfield and Duchess. Scarlet or Crimson mainly Sports; in from or purple Mancunian. A very fine dark variety, Yellow Germania; buff, Mrs. Colby Sharpin, and Persimmon; fancies-mainly Seedlings unnamed.

PREMIER FLOWERS.

The Premier bizarre Carnation was C. B., J. S., Hedderley, from Mr. J. Erwards; the premier flakes. Sportsman, S. F., from Messes. Thomson & Co.; the premier Self, Germania the premier Fancy, Hidalgo, from Mr. Martin Smith.

A great many blooms of Picotees competed in the classes for single specimens; the best heavy reds were Brunette John Smith, and Isabella Lakin; light reds, Thomas William, Mrs. Gorton, and Lena; heavy purples, Mrs. Kingston, Elizabeth, and Ann Lurd; heavy rose, Little Phil, Campanini and Madeline; light rose, Rosic Sydenham, Mrs. Deal and Blanche. Hour; heavy scarlet. Scarlet Queen, Mrs. Sharpe, and Duchess of York; light scarlet, Mrs. Geggie, Faveurite and Dolly Dimple; yellow grounds, Mrs. R. Sydenham, Alice Mills, and Ladas.

Four classes were set apart for bizarres and flakes, self and fancies, and also for white ground and yellow groun Picotees, shown with a single spray of foliage; in some classes twelve blooms were required, in others six blooms, In one or two cases among the light ground flowers, and also among the yellow grounds, some pretty good blooms were shown, but they were generally poor. What useful purpose these classes serve it is difficult to conceive. There was no lack of exhibitors and blooms; but the best of the blooms appeared to attract but little attention. The yellow grounds were the most successful from the artistic point of view.

PLANTS IN POTS.

There were two classes for groups of plants, one to ill a space of 50 the other of 30 ft. The 1st prize in the larger class went to Mr. M. Smith, who staged specimens of superb culture carrying fine heads of bloom, the leading varieties. Silver Strand, Banner, The Abbot, Mrs. Gascoigne, Kingussie, Miss Maud Sullivan, Florida, Britannia, Hampden, and Moseow, all Selfs of various shades, and the following fine yellow grounds: Xerxes, May Queen, His Excellency, Orestes, Rohin Hood, Laura, Beanty, The Dey, with Andromeda as a yellow Self. Mr. C. Tunker was 2nd also with some finely grown specimens, mostly yellow grounds, Virgo and Primrose League predominating, with such Selfs as Cedric, Little John, Duchess of York, Waterwitch, &c.

In the smaller class, Mr. J. Douglas was 1st, having also fine plants of Mrs. Tate, Braw Lass, The Dey, Sadek, President Carnot, Mephisto, Bendigo, a deep purple Self, Mrs. Colby Sharpin, a fine apricot Self, &c. The 2nd prize went to E. Charrisotox, Esq., Mayfield, Chisleburst, who had well-grown and bloomed plants.

The best twelve specimens in pots of any class came also from [Mr. M. Smith, having Benares, Hall, Endymion, Mansfield, Gilda, Perseus, Xerxes, Cupid, Mrs. Tremayne, and others, finely grown and bloomed, though showing signs of the hot weather. Mr. C. Turner came 2nd, the best being Primrose League, George Cruikshank, The Gift, Tom Sayers, and others. Mr. J. Douglas, was 3rd.

Specimen plants, with the exception of one of Paragon from Mr. M. R. Smirn, which took the 1st prize, were very poor, and no further award appeared to have been made.

TABLE DECORATIONS

made a good feature, and there were eight Dinner Tables arranged as for twelve persons, the flowers Canations of any class, with appropriate foliage and glasses. Mr. C. Blick, Mr. Smrth's gardener, took the 1st prize, having a central epergne and a tall trumpet glass on either side, with small specimen glasses about them. Self and yellow ground Carnations of good quality were arranged with feathery asparagus, leaves of Cdadium Argyrites, and Smilax, all well proportioned, fresh, bright, and highly attractive. The 2nd prize table came from Miss Jackson, Weston Hall, Upper Norwood, the fact of an award being made to it occasioned great surprise. Mr. F. W. Seale, Nurseryman, Sevenoaks was a good 3rd, his table arranged much as Mr. Black's.

Mr. J. Douglas had the best Vase of Carnation blooms, a little formal in outline, as it looke I more like a bouquet; still it was deservedly awarded the 1st prize. Mr. C. HARDEN was 2nd.

There were a good many sprays of Carnations in threes, the leading prizes going to those of large size and large blooms.

Mr. C. Blick, was again 1st, having undoubtedly fine blooms of Carnations, but much too large for the purpose; Mr. F. W. Seale, was 2nd.

There were plenty of buttonholes also, those formed of the soft white and yellow grounds being the most effective.

The Martin Smith special prizes, for flowers of Carnations from the open border brought as usual a good competition. The best border variety of self-coloured Carnation was the bright searlet Jim Smyth, a handsome barnet of which was shown by Mr. H. G. Smyth of Drury Lane, W.C. Mt. A. J. Sanders came 2nd with a white self-unnamed; and Mr. P. L. Browne, Hallenbury, with a large pale searlet self.

With six hunches of self-coloured border Carnations, Mr. H. W WESUELIN, Teignmouth, was 1st: Mr Aubert Spurling, Blackheath, 2od; and Mr. A. J. Sanders, 3rd; but all mnamed.

With nine bunches Mr. Weguelin was again 1st; Mr. J. Douglas, 2nd; and Mr. M. V. Charrington, 2nd.

Seedlings were shown in great numbers, and the following Certificates of Merit were awarded to new varieties from Mr. Marin Smith. Miss Mand Sullivan rose self; Endymion also a rose self, very fine; Gilda, yellow self; Perseus, crimson self; Erin, white self of the finest quality; Hidalgo, fancy white, we regard as the scusational flower of the year, so heantful is it; and the following fine yellow grounds—this Excellency Dragoman, having a heavy purple edge; Caress, Empress Eugene, Hygeria, Cupid, Mr. Mackrae, and Councillor. To Mr. H. Geson, for Rosethke Crystal Rose; Mr. M. V. Charrington for Verna, a bright scarlet self; to

Mr. E. C. Sharfin, for Alice Mills, a beautiful yellow ground described by us last week; and to Mr. T. E. Herwood for Lord Wantage, a large pale yellow self; and Mrs. Albert J. Palmer, a buff self.

MISCELLANEOUS EXHIBITS.

Mr. J. Douglas had a table of blooms of the new varieties he is sending out, such as Exile, a deep rose self; Her Gruce, delicate blush, becoming white; Sir John Falstaff, light crimson, large and full; Sweet Briar, pale scarlet, bloom of fine shape; Winifred, rich deep aprieot, yet soft and pleasing; Bendigo, a bluish-purple self; Britannia, a deep yellow self; Cardinal Wolsey, a fine yellow ground; Lady Ridley, white self; Mrs. Eric Hambro, white; Miss Andrey Campbell, yellow; Miss Ellen Terry, white; The Hunter, rich aprieot; and the following very fine yellow grounds: El Dorado, Golden Eagle, Mr. Nigel, Voltaire, Xerves; also the following novelties of the present year:—Black Prince, deep maroon purple self; Distinction, rosy purple, shaded with deep purple; Mogal Y. G., edged with deep red; Mrs. Patrick Campbell, primrose self; and Paradox, a bright searlet self.

Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, staged a large bank of attractive bunches of Carnations, and also of Pentstemons and other flowers, which filled a great space a bold feature.

NURSERY NOTES.

EDENSIDE CARNATIONS.

It is immediately after the exhibition days of the Rose are past, that one's attention is taken by the Carnations and Picotees. During July and August, but especially in the first-named month, in gardens where these excellent border plants are given liberal and intelligent treatment, there is an abundance of blooms assured for cutting purposes, of so choice a nature that they are unexcelled for such purposes. During this month Carnations may be seen by everyone with but little difficulty; but if anyone desire to see thousands upon thousands of blooms upon pot plants, all representative of the best new varieties (some of them so novel that at present, nor for some time to come, will they exist in gardens), let him "book to Bookham," on the London & South-Western Railway, and in Mr. Jas. Douglas's collection will be be satisfied. Three span roofed houses, each 100 feet long, have capacity for the accommodation of a great number of Carnations-nor is much room lost; but, broadly speaking, from end to end in either house is a con tinnous display of the very best varieties up to It is well known that Mr. Douglas limits not his collection to varieties that he has raised himself, successful though he has been in this interesting branch of horticultural pursuit, but the finest varieties that have responded to the skill of that eminent Carnation specialist, Mr. Martin R. Smith, are also contained therein. Doubtless it is open also for the reception of varieties from any other source, should they possess equal merit.

The following varieties were noticed of self-coloured border Carnations to be sent out in the present year: Nabob (Smith), an orange-bull flower, fairly distinct. and of good form and size, habit apparently strong, and not shy to flower. Blush tinted varieties are Her Grace (Smith), and Seagull Smith), the former a large well-formed flower passing to white, vigorous and the latter, possessing a bloom of fine form, maintaining the blush, and of vigorous habit. In Sir Jno. Falstaff Smith are seen one full flowers of pale crimson, likely to be appreciated, it being an exceptionally large flower, with a good calyx. Miss Maud Sullivan (Smith) is salmon into the flowers appeared to be good and full; and the grace, though rather small, yet vigorous. The flowers of this variety were passing. A rich apricot-coloured flower is borne by Winifred. and being good in form, somewhat distinct, and the plant vigorous, it should be welcome, though there are others of nearly the same colour. Exile (Smith) and Sweet Briar (Smith), the former a rose self, and the latter pale scarlet, complete the list of the new ones from Mr. Smith, but flowers of these two we omitted to see on this occa-ion.

Of the newest varieties of yellow-ground Picotees are those we now proceed to mention: Mr. Nigel (Douglas), a large bloom for this section, heavily edged with deep crimson, and doubtless a handsome acquisition. Xerxes (Smith: a flower with bright

clear ground and rose margined; also El Dorado (Smith), a very fine variety with large well-formed flowers, having rich yellow ground, prettily edged, and otherwise marked with bright rose. Voltaire (Smith), has very large flowers with bright ground, and margined and marked with bright ground, and margined and marked with cose. The remaining variety, Golden Eagle (Smith), as the name would appear to indicate, has a golden-yellow ground, the margins being of bright red; the flowers are of good size and form.

The undermentioned we noticed of the new varicties of selfs and fancies other than those raised by Mr. Smith:—Distinction (Douglas), a rosy-purple flower, thickly spotted with purple; Mrs. Patrick Campbell (Douglas), a pretty and good flower of primrose-yellow, the petals being broad, and maintaining their form uncommonly well; Black Prince (Douglas), a deep maroon-purple flower, having good, well-formed petals, a capital and distinct variety; Mogul (Douglas) has extra large flowers, possessing a yellow ground, and marked effectively with blood-red There are other new ones, viz., Garville Gein, described as a heliotrope-coloured flower; and Paradox (Spurling), described as a bright searlet variety.

A new self-coloured border Carnation named Mrs. Douglas must not be omitted from these notes, as it will sure to be a very valued one, but it is not to be distributed until next year. The flowers are of very fine form, of a handsome cherry-red in colour, and it apparently possesses a vigorous and free-blooming habit.

This season's novelties we have now mentioned, excepting the excellent new forms of the Malmaison section which were not in flower. None of them are other than excellent, and each adds to the variety of its particular section. We say this without in the least implying that all of them are superior to varieties which already exist. It is well known that in yellow-ground Picotees, for instance, there is no variety for exhibition even now equal to Mrs. R. Sydenham, and the same may be true in other sections. However, as we have said, all of the new ones possess some merits to recommend them. It would be too great a charge upon the reader's time as well as upon our limited space, to attempt to describe other varieties that were noticed in fine condition, and which are now in the hands of most Carnation lovers, but we may just mention the names of King Arthur, Bendigo, George Cruikshank, The Hunter, Cowslip, and Mrs. Dranfield, for they are remembered with greater vividness. All the plants at Edensido are grown well, but no thinning is practised, and in the place of a few exhibition blooms is seen many more of an average size, and therefore of a character less likely to mislead one.

TUBEROUS BEGONIAS, &C., AT FOREST HILL.

The tuberous Begonias, in the improvement of which Messrs. John Laing & Sons have worked so cleverly and so successfully for many years, are now making their annual display in the large block of houses devoted to them at Forest Hill. In the two great divisions of these showy and useful flowers, viz., the singles and the doubles, it seems scarcely possible to surpass those now in bloom; but still the firm is making provision to get better things among the 500,000 or so seedlings planted out in the open ground, and which will form a magnificent sight in the autumn. But not only on the improvement of their noted fine strain are they at work, for several totally new types are being carefully worked up, and in each class the representatives already in flower are not only beautiful in themselves, but foreshadow much greater things in the same direction. Of the most marked of the new types is the scented-flowere l Begonia, well represented by the large and richlycoloured B. Maréchal Niel, whose flowers have a distinct Tea-Rose scent, which is more marked in the morning than in the evening in some of the class; and the fringed Begonias, which have flowers resembling the best large single strain, but with beautifully and closely-fringed and crimped edges to the floral segments. Some of these are white, with a broad rose-colonred margin: some scarlet, others yellow

or white, and all are striking by reason of their finely-formed and novel flowers.

Other new classes which are being worked up are the crested Begonias, in which each petal has a raised band down the centre, terminating in a fringed tassel, the arrangement on the four-petalled flowers taking the form of a cross. The basket Begonias, which form such lovely objects suspended in greenhouse, conservatory, or portico; the bedding Begonias, which so many gardeners find better than the bedding Pelargonium; and these not only exhibit all the range of colour known in Begonias, but in stature are adapted either for whole beds or for edging, some of the varieties being extremely dwarf, brilliant, and floriferous. The new set of 1896, it is claimed, is the finest set of Begonias ever sent out, and a brave array they make. Of the doubles, J. T. Bennett-Poe is a brilliant crim-on variety of the Camellia-flowered class, and beautifully fringe I; Miss Russell is also a Camellia-flowered kind of a bright orange-scarlet; Snowdrift, the finest of whites, as the Hon. Mrs. Mulholland is of the primrose coloured; Ludy Clifford of Chudleigh, is a large chrome-yellow; Lady F. Fitzroy, light apricot; Mrs. F. W. Soames, a noble salmon-scarlet; Blush Queen, a charming light variety; and Marchioness of Downshire, rose-pink. Of the older, double-flowered kinds the best scemed to be Countess of Craven, a really fine white; Earl of Warwick, dark scarlet; Duke of Fife, salmon-rose; Countess of Warwick, light scarlet; Empress Frederick, rich rose; Invincible, brilliant crimson; Mrs. Hudson, cerise; and The Premier, erimson scarlet.

Of the doubles for bedding, Duke of York, Stanstead Gem, Laing's Golden Ball, Lafayette, Marquis of Stafford, and Madame de Tourtell are excellent,

and give the requisite colours.

The new singles of 1896 are Earl of Essex, a magnificent orange-searlet; Viscount Grimston, crimson; Sir John Dorington, pink; Lady Ampthill, salmon; Lady Foley, light scarlet; Lady Wilkins, goldenbronze; Lord Aldenham, crimson-scarlet; and Marjorie Hoffman, a very fine rose. Of the older kinds were noted as very fine Countess Cowper, white; Distinction, crimson; Sir Chas. Pigott, orange-scarlet; Mrs. Geo. Reynolds, salmon-rose; Mrs. Arnold, yellow; Grand Duchess of Hesse, pure white; and Duke of Edinburgh, dark crimson. In other houses all sections of Begonias are represented, there being a very fine stock of the Rex, or coloured-leaf class; of the shrubby, both winter and summer-flowering, and Begonias of all sorts,

In the other plant-houses is a very good selection of Orchids, both intermediate and cool-hous kinds, among those in bloom in the cool-house being the elegant Odontoglossum elegantulum, and another hybrid of some affinity to O. Coradinei, but with traces of O. triumphans; Lycaste Deppei, Masdevallia Chimara, and other Masdevallias, Odontoglossum crispum, O. Pescatorei, Epidendrum vitellinum, &c. In the warmer houses with some Cittleyas were Caysis aurea, Dendrobium survissimum, D. D.dhousicanum, D. Aphrodite, and other Dendrobes; Acrides odoratum majus, Stanhopea oculata, Cypripedium superbiens, C. Curtisi, &c.

In other houses was remarked a magnificent display of a superb strain of Gloxinias, two of the most distinct varieties being Mr. Edridge, a rich violet plum colour, and Mrs. Edridge, white, with a dark violet-purple band round the segments. In the next house is a good show of Laing's strain of Streptocar, us, which each year seems to approach nearer to the Gloxinia, both in size and in variety of colour; and in other warm houses are the almost innumerable varieties of Caladium, with their varied and charming foliage, as showy as any flowers for which the firm is noted. In the greenhouses is a fine show of scarlet Kalosanthes, white and yellow Marguerites, and other flowers of the season, and the decorative houses are well stocked with Palms of all sizes, Ferns, &c.

Outdoors, the space is shared between the plantedout tuberous Begonias and the hardy berbaceons plants of the showy kinds, such as Phlox, Pentstemous, Anturhinums, Camations, Delphinums, &c., all of which are brilliant with flowers representing the best selections in each class.

MARKETS.

COVENT GARDEN, JULY 23.

We cannot accept any responsibility for the subpoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the sunples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

SEEDS.

LONDON: July 22 - Messrs, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., de Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's market as poorly attended. There is, for the moment, scarcely any sowing denand, whilst all speculation is quite dead. Home-grown Trifolium, with diminished offerings, is very firm. English Blue Pers, of this year's growth, are now showing. Holders of Trefoil exhibit extreme firmness. Canary seed has risen 2s, from the lowest point recently touched. White Mustard keeps steady. Buckwheal is charge. I hissed slow. is dearer. Linseed slow.

FRUIT AND VEGETABLES.

Borougn: July 21 -Quotations:- Cabbages, 1s. tol. to Borough (*) 3400 1 - Quotations. — Camages, 18, 60, 10 38 per fully; Spinach, 18, 90 to 28 90 per bushel, Cauli-flowers, 18 60 to 28 per bushel, and 38, 60 to 48 per bag. The districts indicated by number in the first column are the following: --

Scotland, N. Principal Wheat-producing Districts— 1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Frincipal Grazing, &c., Districts—6, Scotland, W; 7, England, N.W.; S, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 18, is furnished from the Meteorological Office :-

"The weather during this period was fine and dry over the Kingdom as a whole, but was somewhat unsettled, with occasional rain on our extreme north and north west coast, while over 'England, E. and S.E.,' a temporary change to cool rainy weather occurred suddenly on Wednesday or Thursday, accompanied in many places by thunder and

lightning.
"The temperature just equalled the mean in England, E.,"
The highest but was one or two degrees above it elsewhere. The highest but was one of two degrees above it eisewhere. The highest of the maxima were recorded during the earlier days of the week, where they ranged from 88° in 'England, E.,'87' in 'England, S.,' and 85° in the 'Midland Counties,' to 74' in 'Scotland, N.,' and 72° in 'Scotland, W.' The maxima registered on Thursday over the south eastern counties were very low for the season, the readings at Combridge and in London being about 30 lower than those of Tuesday. The lowest of the minima occurred on rather irregular dates, but

lowest of the minima occurred on rather irregular dates, but principally during the latter half of the period; they ranged from 40° in 'Scotland, E. and England, E.,' and 11 in 'Irekund, N,' to 45° in 'Scotland, N and England, E.,' and 10 52 in the 'Channel Islands.'

"The rainful was considerably less than the mean in all districts. Over the western parts of England rain was entirely absent, and in the 'Midland Counties, England, N.E. and the Channel Islands,' the fall was extremely slight.

"The bright snashine exceeded the mean in most districts, but was deficient in 'Scotland N, and W.,' as well as in 'Ireland, N, and England, N.E.' The percentage of the possible duration ranged from 69 in 'England, S.W.,' and 68 in the 'Channel Islands' and from 52 in 'England, S. ' to 59 in 'England, N E.' to 29 in 'Ireland N,' and to 10 in Scotland, N."

JERUSALEM ARTICHOKES. The feeding qualities of the Jerusalem Artichoke have been discovered by a correspondent of the Practical Farmer Cape of Good Hope). He commenced feeding his hogs with them, and noticed in a short time that they were gainng rapidly in growth and flesh, and he gave them no corn till in the finishing process, when he afforded a little. He found that he had put the swinc on the market at less cost than ever before, and that there was money in them when fed on Artichokes. The tops of the plant are useful as folder, cattle eating them readily. Some growers claim to have raised 1000 bushels of tubers per acre, but 600 bushels is considered a good crop; and an aere will keep from twenty to thirty head of swine through the winter months. The Artichoke is a plant which the de pressed farmer and landowner in this country might also find "money in."

ENQUIRY.

" He that questioneth much shall learn mach."- By on.

THE LITCHEE (p. 742, last volume).—Dr. Franceschi, Santa Barbara, California, writes to say that plants of Nephelium Litchee can be supplied in quantities by him.

Books: W. B. M. The best work is Mr. F. W. Burbidge's, The Propagation and Improvement of Plants, published by W. Blackwood & Sons, London and Edinburgh. It contains many details concerning hybridisation.

Carnations: Louing Grower, and E. F. C. T.—We do not undertake to name florists' flowers. Send them to some grower.

CROTON SPORT: L. H. F. The leaves you send are very pretty, and if they be the result of a sport, the variety is well worth perpetuating.

CUCUMBERS GROWN IN A GREEN-HOUSE: The treatment afforded would be right, if only the plants had bottom heat slightly in advance of the average top heat. If you had a brick-pit partly built in the soil of 4 feet in depth, and you could fill this with tree leaves two-thirds, and one third stable-litter, you would have the means of growing Cucumbers or Melons from April to September. At other times, a stage might be put over the pit, and filled with green-house plaots in pots. One Cncumber plant will carry one dozen fruits in

various stages of development, and perfect most of them; and it will continue to do this for several weeks, afterwards fewer should be left, and the plant reinvigorated with rich surface dressing of stable-dung and loam laid on about 1 inch Good varieties of Cucumber are Lockie's Perfection, Market Favourite, Cardiff Castle, and Sion House.

DISEASED TOMATO FRUITS: A Grower, The fruits are affected with Peronospera Lycopersici, often mentioned in these columns in recent years. There mentioned in these columns in recent years. is no known cure. Cut off and burn all fruits showing any signs of the disease. It may be kept at bay by the use of the Bordeaux Mixture, applied at intervals of two or three weeks; but with ripening fruits that is not possible. A dryish treatment of the plants is preferable to one that is the reverse, whether the disease shows itself or not.

GARDENERS' SOCIETIES: L. Druge. The Secretary of the Gardeners' Royal Benevolent Institution is Mr. G. J. Ingram, 50, Parhament Street, London, S.W.; United Horticultural Benefit and Provident, Secretary, Mr. W. Coliins, 9, Martindale Road, Balham, London, S. W.

INSECTS INJURING CARROTS: C. N. The insects sent are the caterpillars of one of the "cut-worm" moths (Agrotidæ), and as far as I can see, without having specimens at hand for comparison, those of the Turnip-moth, Agrotis segetum, which are well-known destroyers of root crops. I think it hardly necessary in the case of so well known an insect to go at length into measures which have been adopted against it; but, hand-picking by turning over the earth round the roots by day, or at night with a lantern) has been successfully tried; and in America the laying between the rows of baits consisting of Lettuces or roots well sprinkled with Paris Green. Walter F. H. Blandford

LACHENALIAS: Thus, T. We can find no trace of fungi, except the common saprophytic mould which only flourishes on dead matter. no clue to the cause of failure which we can detect in the bulbs. M. C. C.

LAWN-TENNIS COURT: J. C. The total length of the court should be 78 feet, divided into two courts of each 21 feet in length, and two of each In feet in length, on opposite sides of the central line where the net will be stretchell across. The width of the court is 27 feet, and together with the outer belts of 13 feet each, make a total breadth of 36 feet. The net at the sides should measure 33 feet, and in the middle 3 feet in height. Service-line is 21 feet

MAIDENHAIR FERN TO PRESERVE : W. & Sons. Dry in the ordinary manner between sheets of Herbarium paper under pressure, changing the sheets of paper twice a week till the sap in the frond is absorbed, then secure with narrow strips of thin paper laid across the stipes and branchlet of the frond. To give to Fern fronds that are to be used in vases, &c., the desirable softness and natural gracefulness, they should, after drying, be laid in a vessel of sufficient dimensions to accommodate them when laid straight and flat, containing a mixture of equal straight and mat, containing a mixture of equal parts, spirit and glycerine. Here the fronds-should remain immersed till they are saturated, and then hung in a shady place to become dry. The spirit evaporates whilst the glycerine remains in the substance of the frond. The glycerine does not prevent the colouring of the fronds if that is desired.

NAMES OF FRUITS: J. H. J. Peach: The fruit was pounded nearly to pulp, but judging from general appearances it is probably Early Rivers, one of the finest Peaches known.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number,—C. L. S. Liliam sulphureum Baker, Botanival Mogazine, t. 7257. Only known in Upper Burma, J. G. B.—John Elliot, Jun. Inula salicifolia, habitat Russi.—W. S. Diospyros Lotus, Linn. — R. J. H. Bad specimens, all withered: we guess them to be—1, Nasturtinn palustre: 2, Polygonum Convolvulus; 2, Sautallaria galaciantes. 3. Scutellaria galerienlata; 4. Nasturtium silvestre; 5, Sium angustifolium; 6, Barbarea vulgaris; 7, Pastinaca sativa; 8, withered beyond recognition: 9, Erigeron canadensis.—E. S. J. 7. A pretty variety of Oucidium Lanceauum; rather small, but bright in colour.—k. W. \mathcal{D} . It is impossible to give the names accurately without seeing flowers, but those specimens sent may be - 1, Brassia species; 2, Oncidium sphacelatum;

3, Dendrobium Pierardi; 4, Epidendrum fragrans; 5, with flower is Trichopilia tortilis. - W. T. T. Eastbourne. All withered, and hardly recognisable. 1. Caucalis Authriseus; 2. Sison amomum; 3, Silaus pratensis; 4, Charophyllum temulum.-II. D. 1, Cryptomeria japonica var. spiralis; 2, Cupressus (Retinospora) obtusa var. lycopodioides; 3, Pieca excelsa elanbrassiliana; 4, Libocedrus chilensis; 5, Pinus cembra nana; 6, Abues brachychaenss, 5, 7 has cembra hand, 6, Ames brachy-phylla, probably.—No name. Carnations, fair; and Catalpa bignonioides.—Old Kewite, Belgium. Brassavola cordata.—E. N.—Polygonum cuspidatum.—N. C. Specimens very bad (except Echihops), and withered when received; we do our lest. I and 2, Ferns; 3, Thalietrum sp.; 4, a Geranium; 5, Echinops spherocephalus; 6, Erythrea Centaurium. - G. B. 1, Catalpa bignonioides; 2. Cornus mas variegata; 3. Abies nobilis; 4. specimen insufficient; 5. Prunus Pissardi; 6. Acer japonicum. F. H. S. Please address such questions to the editor, not to the publisher. Juglans nigra: 2, Ail inthus glandulosa; 3, Abies nobilis, good specimens, carefully packed, thank you.—C. G. 1, Nepeta cataria; 2, Lathyrus aphaca; 3, Medicago lupulina; 1, Bapleurum rotundifolium.

NATIONAL DAHLIA SOCIETY: Enquirer. The Secretary is Mr. T. W. Girdlestone, M.A., Sunningelale, Berks. The date of the Dahlia show will be given in our list of appointments for September.

PEACH SPLIT AT THE STONE: J. W. This arises probably from imperfect fertilisation.

PRUNUS PISSARDI: T,J. The proper name for this is P. cerasifera var. atropurpurea. It is a purple leaved form of the Myrobalan Plum. It might be used for culinary purposes or for dessert, but the flavour is only of moderate quality. It produces fruit commonly, and now that the plants are getting older, may be expected to do so freely.

Sylsafy: A. B. C. In a collection of nine distinct kinds of vegetables, supposing that ten points represented the highest number, first class Salsafy would take fewer than Intermediate Carrots, say as three are to five, if the latter were equally good.

SLEDLING CARNATIONS: Mrs. M. C. Most of the flowers you send us are good ones, especially those numbered one, two, and three. Evidently the seed supplied by the National Carnation Society has been selected with care; it is only one in a very large number of seedlings, however, that can be expected to be better than all existing varieties.

Souvenir de la Malmaison Carnation: P. B.B. If your plants are one, two, or three years old, you may rejuvenate them by layering the shoots around the mother plants, leaving them in situ when furnished with roots; or you may cut the shoots hard back, and thus get them to make new shoots close at home.

STRAWBURBIES . F. C. Myatt's Seedling is synonymous with Filbert Pine, an excellent variety and very prolific, taking the place of British Queen where that one does not succeed. It is late. Myatt's Prolific is the same as Wonderful, a tender, sweet, yet briskly-flavoured variety, which forces well. Aberdeen Favourite (seedling ! is the same as Rosebery, a large-fruited, conical-shaped berry, having a dark red skin, almost black, when the fruit is ripe, and deeply imbedded sceds. We do not know the name of the raiser.

Wasp-destroying Paper: G. W. E. Emquire of the large "horticultural sundriesmen."

PROSPECTUS.

This Company has been formed to acquire, amalgamate, and develop the trade of certain well-known Frnit, Flower, and Vegetable producing properties in Guernsey. To acquire and early on in connection therewith the business of salesmen, and likewise to provide facilities for the collection of produce in the Channel Islands, act as Wholesale Coal and Manure Merchants, and generally to promote and organise the welfare of this vast yet growing industry. For the purpose of the Company a careful selection of some of the finest properties in Guernsey has been made, and the following well-known Vineries and Nurseries are to be acquired:—

The Duveanx Vineries

The Duveanx Vineries

The Devonian Vineries

The Balmoral

Belgrave

Belgrave

Belgrave

Belgrave

Fountain Lodge

These Properties together cover an area of about 36 acres, covered with glass to the extent of 700,192 superficial feet. Upon the basis of last year's crop it is estimated that they should yield about 600 tons of Tomatos and 40 tons of Giapes, in addition to many thousands of baskets and boxes of French Beans, Vegetables, Flowers, Fruit, &c.

The expense of working these properties when amalgamated, it is anticipated, will show a great saving.

sield about 600 tons of Tomatos and 40 tons of Grages, in addition to many thousands of baskets and boxes of French Beans, Vegetables, Flowers, Fruit, &c.

The expense of working these properties when analgamated, it is anticipated, will show a great saving.

The Company, by undertaking the systematic collection of produce, will supply a much medded want in the Island, and will also be able to diver the sale of a large quantity of produce into its own hands, and thus open up a very profitable source of meone.

With this object in view, the Directors have arranged 10 acquire the oldestablished connexion carried on by Mr. Unwin in Covent Garden, and have arranged with him to poin the Board and to conduct this part of the business.

There are other important economies to be effected, among which may be noted the cost of freight and material, such as soal and manures.

Hitherto every grower has shipped his own fruit in comparatively small quantities, and consequently is completed not only to add cartage to the expense of growing, but addition of shapping and railway charges which often, under these conditions, absorba large proportion of the profit. The Company by undertaking the collection, avoid this to small growers, and at the same time influence the consignment into their own hands. This will not only give them a considerable profit, but will keep them in closer touch with the market and enable them to some extent to regulate the supply in accordance with the demand. The importance of this can be appreciated when it is considered that in the item of Tomatos alone, the variation in price is from 2s. 6d. to 23d. a lb.

The produce from the various properties about to be acquired by the Company is well-known on the London Market, and has always been disposed of at good and renuncrative prices. The Company will not only be a very large consumer of coasts and manures, but it will also undertake the selection and sale of them to other growers, and owing to their advantages in buying this should also prove a valuable

... £68,085 6 4 Making a total of .

Some of these Properties have, in our opinion, additional value as building land, or prospective building land, but in no case have we made our valuation upon that basis, but have restricted ourselves to such a figure as, having regard to soil, position, and other advantages, the lands are worth for horticultural purposes. We are, Gentlemen, Your obedient servants.

Figure Region & Fourber, Price & Furber, Price & Furber, Price & Furber, Price & Furber, Price & Advantas, has made a personal visit to and investigated the Guernsey properties, together with Mr. Unwirds business in London, and his report is as follows:

The sham Buddings Resinchall Street

The sham Buddings Resinchall Street

The sham Buddings Resinchall Street

No.....

Mr. A. A. Yeatman (Fellow of the Institute of Charlered Accountants), has made a personal visit to and investigated the Guernsey properties, tegether with Mr. Unwin's business in London, and his report is as follows:—

"Dear Sirs,

"Thave visited the properties in Guernsey proposed to be acquired by this Company, and have carefully investigated them, and also Mr. Unwin's business in Covent Garden.

"I have found a difficulty in treating all the accounts on the same basis, but an satisfied that the annual net prouts, after allowing for conomies, which will be carriantly effected, and for the saving of commission on the sale of the produce, may be taken at the sum of £11,120 (Eleven Thousand One Hundred and Twenty Founds) after payment of all outgoines, melading expenses of management, regains and depreciation.

"This profit makes no allowance for any increase in the out-part of the properties, nor for income from any other of the sources anticipated by you. "Yours fathfully.

"(Signed) A. A. YEATMAN, Chartered Accountant."

The Vendor has fixed the Purchase price at £140,000, of which the whole of the Ordinary Shares (less the 10,000 hereafter referred to), will be taken in part payment, and he further reserves the right to apply for and have allotted one-third of the Preference Shares, the limit allowed by the rules of the Stock Evchange.

Mr. William Entwisle, the Company's further manager in Guernsey, has carefully considered the amount of working capital which the Company will require, and he is satisfied that there is sufficient in the growing crops to provide for all working expenses relative to the lands acquired. In addition to this, £10,000 in Ordinary Shares have been set aside to provide any additional working capital which the Company will require, and he is satisfied that there is sufficient in the growing crops to provide for all working expenses relative to the lands acquired. In addition to this, £10,000 in Ordinary Shares have been set aside to provide any additional working expirate which he de

due course.

Applications for shares should be made on the accompanying form, and same forwarded with the deposit to the Company's Bankers, and if the number of shares allotted be less than those applied for the surplus paid will be appropriated towards the amount due on allotment; if no allotment be made the deposit will be returned in full.

Prospectuses and application forms can be obtained from the Company's Brokers and Schicitors, and at the Registered Offices, 23, Budge Row, E.C.

17th July, 1896.

This Application Form may be used, and should be filled in and sent with the amount payable on application to the London & Westminster Bank, Lothbury, E.C.

FORM OF APPLICATION FOR CUMULATIVE PREFERENCE SHARES.

CHANNEL ISLANDS PRODUCE COMPANY, Limited, CAPITAL £150,000. Divided into 15,000 Five per cent. Cumulative Preference Shares of £5 each (Preferential as to Capital as well as Dividend', and 75,000 Ordinary Shares of £1 each.

To the Directors of THE CHANNEL ISLANDS PRODUCE COMPANY, LIMITED.

Gentlemen,—Having paid to your Bankers, the sum of £ heing a deposit of 5s, per Share on Application for Preference Shares of £5 each in the above Company, I hereby request that you will allot to me that number of Shares, upon the terms of the Prospectus of 17th July, 1866, and subject to the Memorandum and Articles of Association of the said Company, and I agree to accept such Shares, or any less number you may allot me, and to pay 15s per Share on Allotment, and the subsequent instalments when due, and I and I agree to accept such Shares for the Shares so allotted to me, and I agree with the Company as Trustee for you and other persons who may be liable, t waive any fuller compliance with Sec. 38 of the Companies Act, 1867, than as contained in the said Prospectus.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 1, 1896.

RÖNTGEN RAYS IN BOTANY

THE X-rays have attracted such universal uttention that it is not surprising to learn that some experiments have been made to determine the effects of these rays on germinating plants, and it may be interesting to readers of the tiurdeners' Chronicle if a brief summary of these experiments be here given. Mr. Alfred Schober, who recently read a paper before the German Botanical Society on this subject, says that he was led to the investigation by the similarity between X-rays and the ultra violet light of the spectrum. Sachs had shown that heliotropic curvature (turning to the sun) is incited in plants by blue, violet, and the invisible ultra violet rays, in about an equal degree with full white light; while the red, yellow, and green parts of the spectrum are apparently inactive: and Rothert, in his work on heliotropism, found that the cotyledons of germinating Oat plants were particularly sensitive to the action of light, and these were thus selected for the experiments, some of which were described in a recent number of the Electrical Review.

Vigorous plants germinated in full light, with cotyledons from 1 to 2 centimetres long, were selected and set in damp sand in a dark box. the walls of which were about 1 centimetre thick, and blackened on both sides. A Hittorf's tube was placed at one end of this box, at the height of the seedlings, and about I centimetre distant from the box. The seedlings were arranged at one end of the box, so that they were about 2 centimètres distant from the tube. The inductor had a spark length of about 12 centimètres, and was kept at its highest capacity during the experiment. The plants were exposed to the action of the rays for thirty minutes, after which an examination showed that no apparent effect had been produced. The box was then closed, and the exposure continned for another half-hour. A careful examination at the end of this time led to the conclusion that no visible effect had been produced.

It was found impracticable to continue the experiment longer, as the tube in this time had become excessively heated. After the experiment was concluded the plants used were proved to be normally sensitive, as an exposure of one hour to diffused daylight, passed through a small horizontal slit, resulted in a noticeable curvature, which in four hours had reached 60 from the vertical. As the inductor was excited to its greatest capacity during the experiment, the plants being placed in as close proximity to the light as possible; and as after the experiment the plants were found to be normally sensitive, showing noticeable curvature on an equal exposure to white light -- the author concludes that the new rays appear to differ from light in that they do not stimulate heliotropic curvature.

It would, however, be as well to submit plants to the action of the X-rays for a longer interval than was here done, in order to arrive at a final conclusion as to whether they have no power to induce heliotropic curvature.

Mr. George J. Burch has been making some experiments on plant-structure as revealed by Rontgen rays at the University Extension College, Reading, as already mentioned in these columns. In investigating the influence of colour upon the relative opacity of certain substances, it occurred to one of Mr. Burch's colleagues to compare a purple Hyacinth with a piece of purple glass which had proved remarkably opaque. Mr. Burch found, upon development, that details of the structure of the

ance in the cortex as far as the endoderm, and even in the medullary rays and the pith. The palisade tissue of the leaf is reduced or entirely disappears, and the epidermal cell-walls are thinner, while the bark is less developed, and the various tissues of the stem are less differentiated. A discontinuous electric light is, he says, intermediate in effect between sunlight, and a continuous electric light. Alpine plants cultivated under a continuous electric light exhibit points of structure identical with those of Arctic plants, which are exposed to almost continuous sunlight in the summer.

A paper has also recently been published in the *Bulletino* of the Italian Botanical Society by Professor Alou, who brings forward evidence

LYCHNIS VISCARIA.

The beanty of this plant for the purpose of bedding is well exhibited in the accompanying photograph of a bed in the Royal Botanic Garden, Edinburgh. For a situation of a dryish nature nothing could be more suitable, yet in this respect it is by no means fastidious. A glimpse at the illustration (fig. 23) will give at once an idea of the floriferousness of the double-flowered form of Lychnis Viscaria, and although the flowers do not last so long as might be desired, yet their brilliancy is very attractive, during the few weeks the plant remains in bloom. L. Viscaria is a British species, though rare, and is found in other countries of Europe and in Siberia. Other beds shown in the photograph are several varieties of Violas, the white one being V. Countess

Fig. 23.-Lychnis viscaria in the royal botanical gardens, edinburgh.

llower were distinctly visible. Following up this clue, a number of flowers were "photographed" with the Rentgen rays. By suitably arranging the exposure and the development, Mr. Burch was able to show the ovules inside the ovary in an unopened bud, the seeds within a seed-vessel, and even the veins upon the white petal of a flower.

Mr. Burch puts these results down to refraction and reflection of the rays when the incidence is sufficiently oblique. Similar indications are visible in a photograph of a fish's eye, in which there is a narrow dark shadow that can only be due to internal total reflection.

In connection with this subject it is interesting to note that M. Bonnier, in a recent communication on the action of electricity on vegetation, states that a continuous electric light promotes the formation of chlorophyll, and brings about at the same time a simpler anatomical structure of the leaves. The distribution of the chlorophyll in the fissues is more extended than in ordinary daylight; chlorophyll grams make their appear-

that both terrestrial and atmospheric electricity exercise an influence on the germination of seeds and the growth of plants. Herbert C. Fyfe.

ORCHID NOTES AND GLEANINGS.

LELIA MONOPHYLLA.

Norming but the reputation of being difficult to grow, in consequence of growing it in excessive beat, to which the few specimens of the earlier introductions were subjected, prevents this pretty, orangesearlet dwarf, Jamaican Lælia, from being so general a favourite as Sophronitis grandiflora, to which it seems to form a suitable companion plant. Recent importations which have been grown suspended in the warm end of a cool Orcbid-house, have given the most satisfactory results. Some time ago, Sir Trevor Lawrence, Bart., had a specimen with twenty-eight flowers, and at present in the nurseries of Messrs. Jas. Veitch & Son, King's Road, Chelsea, is one with nineteen spikes, and several with a fewer number. The plant, however, is never likely to be plentiful, being very difficult to import.

of Hopetoun. A good bed of Lilium umbellatum croceum punctatum is also partly included, which was bearing a profuse number of large flowers; while immediately in front of this is a bed of Heuchera sanguinea, the deep coloured variety which in some seasons is a mass of its deep-coloured inflorescences, R. L. H.

COLONIAL NOTES.

ORCHARD WORK AT THE CAPE.

The Cape of Good Hope Department of Agriculture issues a Bulletin on orchard work, drawn up by Me-srs. P. MacOwen and Eustace Pillans. The information is divided into sections dealing with such details as the artificial character of modern fruit trees, construction and function of the root, soil, constituents of plant-food, respiration of roots, manuring, laying-out, and planting. After this, such fruits as the Apricot, Peach, Apple, Pear, Plum. Orange, Lemon, Citron, Fig., Walnut, Chestnut, and Quince, are severally dealt with, the best sorts of each being mentioned.

SUCCESSION OF STRAW. BERRIES.

Mr. Wilson, of the Greenside Nursery, St. Andrews, N.B., is quite right about the earliness of the Royal Sovereign. Its general place in the garden and for forcing is as a second or third early. I have just heard from a Kentish grower to-day who offers

are Royal Sovereign, Vicomtesse Héricart du Thury, President, Dr. Hogg, and British Queen. Short and select as this list is, the two last varieties will strike some growers as one too many. Where the British Queen does its best, Dr. Hogg is not needed. Where the Queen is not perfect, it is a pity to run it as a rival of Dr. Hogg, which often thrives better. Closely related as these two Strawberries are, it is seldon

DIDYMOCARPUS MALAYANUS.

OUR illustration (fig. 24) shows a new species of this genus, which will be described and figured in a forthcoming number of the *Botanical Magazine*. It was exhibited by Messrs, Veitch at the meeting of the Royal Horticultural Society on July 14, when it received a First-class Certificate. The woodcut shows

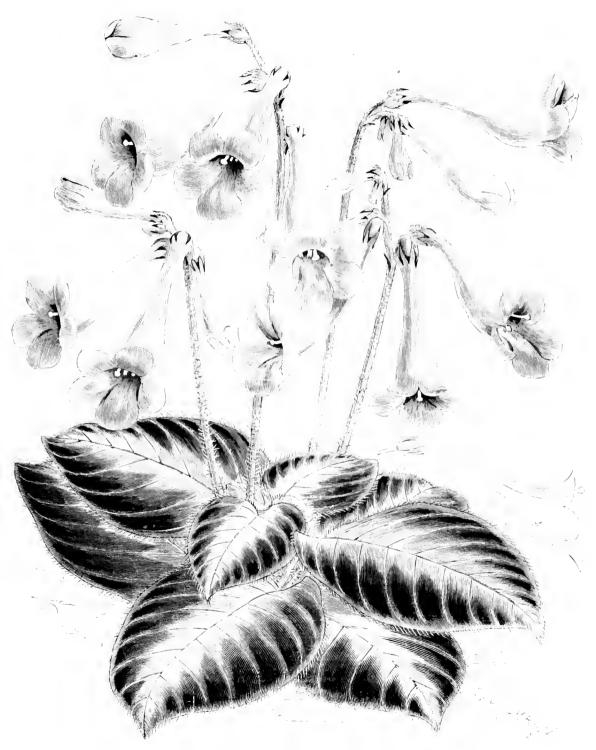

Fig. 24.—DIDYMOCARPUS MALAYANUS; ThoreRs Pale Yellow, Bot. Mag. INFD.

500,000 of Royal Sovereign; the numbers are its highest possible testimonial. This grower adds that Garibaldi and Vicomtesse Héricart du Thury are one and the same, which often means that the writer has only handled one variety under either or both names.

This grower's selection of the best this year in Kent is specially valuable for its brevity, as well as for the high excellency of the selected sorts. They

they are alike good in any field or garden. Hence the wisdom and profit of growing only one of the two that thrives better in any given locality. The British Queen when perfect, as it is not with at times so far north as Inverness and Aberdeenshire, within sight of the snow, and in many other places north and south, merits its name, as queen of flavour, flesh, and beauty. D. T. Fish.

the habit of the plant. The leaves are of a rich green colour, overlaid with a covering of white silky hairs, which imput a silvery sheen to the leaves. The flowers are of a pale primrose-yellow. There are two fertile stamens and two inconspicuous rudimentary filaments. It was discovered by Mr Curtis of Penang, and will be an attractive addition to our collection of stove plants.

REPORT ON THE CONDITION OF THE FRUIT CROPS.

[FROM OUR OWN CORRESPONDENTS, AUGUST, 1896.]

The words "arcrage," "over," or "under," as the case may be, indicate the amount of the crop; and "good," "very good," or "bad," indicate the quality.

The counties are arranged in numbered groups, to correspond with those adopted in the Weather Reports of the Meteorological Department, and followed in our weekly Weather Tables.

*_** Fuller comments will be given in the following numbers. See also Leading Article on page 132.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WAITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused com-munications or illustrations, unless by special arrangement.

Illustrations .- The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these of gardens, or of remarkable plants, flowers, trees, de.; but he cannot be responsible for loss or injury.

Local News .- Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is descrable to bring under the notice of horticulturists.

Newspapers.-Correspondents sending newspapers should be currful to mark the paragraphs they wish the Editor to see,

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -63:

THANKS to the courtesy of our The Fruit correspondents in all parts of the Crops. Kingdom, we are enabled to give a general summary showing the condition of the fruit crops for the year. The returns have been made mostly by the same recorders who have obliged us in former years, and although a certain amount of vagueness is inevitable, yet it is impossible to doubt that, substantially, the report we publish today does accurately represent the condition of the crops. We cannot say the report is entirely satisfactory; take for instance Apples. About 50 per cent, of the reports from England show that the crop is under average as to quantity, although the quality is reported as good. Pears are even more behindhand. Plums show a better record; only thirteen out of seventy-one returns from Scotland are below the average, In England and Wales 120 out of 286 reports were under average. Cherries yielded generally a good average crop. Peaches and Nectarines, singularly enough, were much above average; thus out of 234 returns from England and Wales only thirty-one were under average, whilst 127 were up to the average, and seventy-six above it. The abundance of these fruits is a feature of the year so far as fruit is concerned. A similar remark

applies to Apricots, for out of 256 returns from England, only 66 were below average.

Small fruits were generally above the average; whilst Strawberries have been average, and Nuts rather above it.

We append a table, which shows in a succinct form the principal numerical results gleaned

from the reports of our correspondents, and in subsequent issues we shall give extracts from the detailed notes with which they have favoured

A ROSE GARDEN AT FOREST GATE. -Our illustration on p 133, shows what a pretty effect may be obtained with I'o es in the small area of a suburban back garden, the plants employed as dwarfs, standards, and climbers, in this case being fairly floriferous, although small and apparently young. In such confined spaces the arrangements are of necessity stiff and formal, owing to the walks having to run parallel with or at right angles to the surrounding walls and fences, but much of this might have been hidden by allowing creeping plants to grow over the edgings of the beds, and employing here and there plants of a more graceful habit than Roses of the hybrid perpetual class to grow without much restraint. The bane of the Rose in London gardens is, the too great amount of shade and shelter from neighbouring buildings with the resulting lack of sunshine, and the want of a suitable kind of soil. The best soil for them is sound pasture loam, a substance not readily obtainable in town. The garden figured beloogs to Mr. W. A. STURROCH, 27, St. James' Road, Forest Gate.

GENERAL HORTICULTURAL EXHIBITION AT BERLIN.-We have received the programme of the Exhibition which is to be held in the Trpetower Park, Perlin, from April 28 to May 9, 1897, on the occasion of the seventy-fifth anniversary of the Society for the Promotion of Hosticulture in Prussia. The schedule is divided into thirteen primary divisions, and very unmerous minor subdivisions, embracing, as it seems, the whole range of horticulture. Dr. L. WITTMACK is the general Secretary, at Invaliden Strasse 42, Berlin.

DISEASES OF PLANTS .- Messrs. KIRCUNER & BOLTSHAUSER have just issued through Mr. Eugen ULMER, of Stuttgart, a series of colonred representations of the principal fungi attacking cereal crops. The plates are of moderate size, so that they are less costly than is commonly the case, but they are accurate and well executed. The work will be of great use for reference purposes. In addition to the fungi, some of the insects are also represented. It is intended to bring out similar series devoted to the diseases of pasture plants, root-crops, vegetables, fruit, &c.

PENNSYLVANIA HORTICULTURAL SOCIETY .-The Transactions of this Society recently published, include papers read from December, 1894, to the end of 1895. Some of the more important of these are, "Something about Vegetables" (by BURNET LANDRETU), very comprehensive and practical; "An Historical Paper" (by the same writer), mentioning the rise of horticulture and of agricultural and horticultural societies, and the work done during their progress; "Address on Street Trees" (also by Mr. LANDRETH), mentioning many suitable species not commonly utilised for the purpose; "Notes about the Progress in Floriculture" (EDWIN LONSDALE); "Plants for Home Adornment" (ROBERT CRAIG); "The Orchard and its Care" (Prof. E. B. VOORNEES); "Nut Trees" (F. M. BARTHAM); "Trees for a Country Place" (G. T. CURWEN); "When to Use Plant Food "(R. M. SIMMERS); and a "Report of the Annual Exhibition of the Society" (by DAVID RUST), as held last year,

M. CHARLES JOLY .- We note with much gratification that the Société Nationale d'Horticulture de France has awarded a large Gold Medal to M. Joly in acknowledgment of his active and continued collaboration in the Journal of that society. Certainly, the compliment has been well earned.

"TRANSACTIONS OF THE MASSACHUSETTS HORTICULTURAL SOCIETY."-The First Part of this publication for the year 1895 is now ready, and contains the report for the season, and synopses on lectures treating of Days with Our Birds (Mrs. KATE TRYON, Cambridge); Flower-pots and their Manufacture (A. Il. Hews), Fungous Diseases of Ornamental Plants (Professor Byron D. Halsted); Hardy Plants and Shrubs (J. W. Elliott), Construction and Heating of Glasshouses, Economic Entomology, Experimental Evolution amongst Plants, A Talk on Gardens, Budding and Grafting, Notes on Tomatos, Edible Native Fungi, and Commercial Fertilisers in Horticulture.

"PLANTS OF MANITOBA."-Messrs, MARCUS WARD & Co. have issued under this name a handsome series of forty coloured plates in a neat wrapper. The plants chosen as typical of the Manitoba flora are nicely drawn and coloured; in most cases a spray of flowers is represented, and enlarged diagrams of special parts, such as the fruit, stem, or root are also given. On each plate the botanical and popular name of the species is written, and the family to which it belongs. If of no special scientific value, this series of pictures is, at any rate, pretty and accurate, so far as it goes, and we will hope may prove attractive enough to encourage admirers to pursue the study more seriously.

VIOLA CONFERENCE, 1896. - A conference meeting will be held in the Royal Botanic Society's Gardens, Regent's Park, on Saturday, August 8. At 12 o'clock (noon) an introductory address will be given by the Chairman, Mr. A. J. ROWBERRY; then a report of special committee retrial of Violas, Mr. R. DEAN; followed by a paper by Dr. VEIT B. WITTROCK, Director of the Botanic Gardens, Bergisland, near Stockholm; one on Violas for bedding purposes, with special reference to their adaptability for association with other plants. Papers will also be read by Mr. C. Jordan, Superintendent, Regent's Park, N.W.; and Mr. J. W. Moorman, Superintendent, Victoria Park, N.E.; by Mr. H. A. Neets and Mr. W. Baxteu, on Violas for exhibition, with special reference to newer varieties; by Mr. J. D. Stuart, Belfast, on Viola sports. A report of judges of seedlings will be submitted to the Conference. It is particularly requested that new varieties be sent for consideration; a spray or bunch of not less than six blooms of any new variety to be staged. All new

Engleheart has very long crimson petals; Oxoman, a deep crimson variety, appears a little thin in flower, albeit its calyx is burst; Crombie's Pink is hardly equal to some of the others in size; but Favourite is a very pretty Picotee, with white ground and rose edged.

CHESHUNT, WORMLEY, AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—A meeting of this Society was held at Turnford, on Thursday, July 23, when Mr. W. HARRISON raised a discussion on "Horticulture, as a source of profit to the employer, and a means of livelihood for the

nature of the experiments which are being carried out at Rothamsted. Mr. J. J. Willis then conducted the party round the farm, explaining the character, and results compared, of all the different chemical manures applied to various crops. At the close, a hearty vote of thanks was accorded. Sir J. B. Lawes for his kindness; and to Mr. Willis, who briefly replied,

READING AND DISTRICT GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION. -The monthly meeting of the above association was held on Monday in the club room, at the British Workman, and was' well

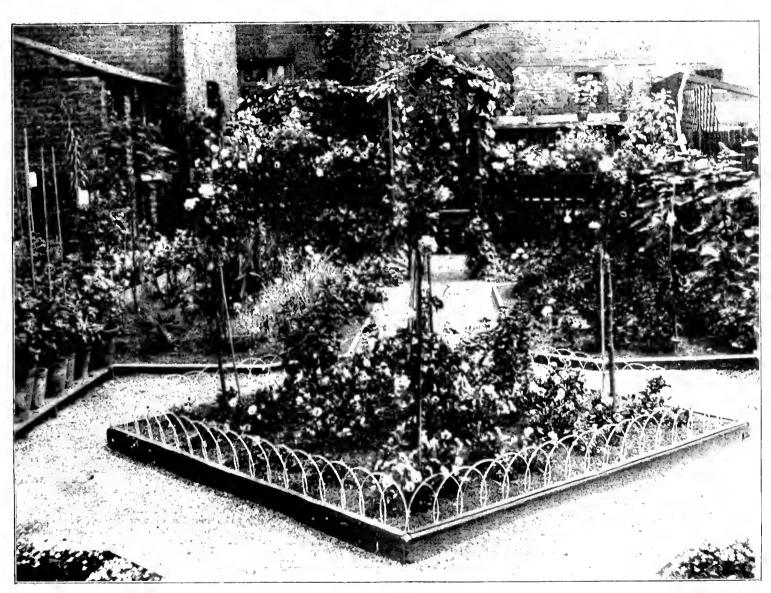

FIG. 25.—BOSES IN A S BURBAN BACK GARDEN. (SEE P. 132):

varieties must be stajed for inspection by 11 o'clock, so that they may be judged when quite fresh. Any blooms sent by post must reach the Royal Botanic Gardens on the morning of August 8, achdressed to Mr. J. B. Sowerby, Secretary, Royal Botanic Gardens, Regent's Park, London, N.W. A. J. RO BERRY Chairman; RECHARD DEAN, Secretary.

FLOWERS IN SEASON.—We have received from Messes, Laing & Mather, Kelso-on-Tweed, blooms from some useful varieties of Border Carnations, grown out-of-doors.—Uriah Pike and Ketton Rose are well known to be among the best.—Duchess of Fife, rose-coloured, and Mrs. Barnewell Elliot, a charming pink flower, are very fine; also The Pasha, salmon-pink, and Mrs. Frank Watts, white or pale straw-coloured; Paul

employé." The next meeting will be on August 13, when Mr. R. Wunderlich will contribute a poper on "Cut Flowers and Florists' Work." The first onting of the Society took place on Saturday, July 25, Messrs, F. Sander & Co.'s mursery being one of the places visited; later the party travelled to Harpenden, where luncheon was served in a tent on the cricketground. Among those present were Mr. Dean, secretary of the Herts County Council; Mr. H. J. Bushley, Mr. Niel Mackenzie, Mr. W. H. Miles, vice-presidents of the society; Mr. J. J. Willis, Harpenden, Mr. F. S. Hutchason; chairman, Mr. Wm. Harrison, vice-chairman; and Mr. W. L. Yates, bon, secretary. The party then paid a visit to Sir J. B. Lawes' experimental farms at Rothamsted. Sir J. H. Gilbert delivered a short lecture in the Laboratory, describing the

attended. The subjects for the evening were "Carnations" and "Fruits in Season," The former subject was introduced by Mr. E. DEVRLOVE, gardener at Brookfields, Burghfield, and the latter by Mr. T. NEVI, the chairman of the Association. The meeting, although taking more of a conversational turn than usual, was exceedingly interesting, some of the members joining in the discussion. The exhibits were numerous, Carnations predominating, collections e ming from Messrs, Devrhove, Turrox, Neve, and Garbann, whilst other flowers were staged by Messrs. CHAMBERLAIN, DORL, and BAILEY; and two finelycolonred fruits, "Sutton's Hero of Lockinge Melon," from Mr. Proc. After the meeting the flowers were sent to the Royal Berkshire Hospital for the one of the patients.

THE CHELMSFORD COUNTY SCHOOL OF HORTICULTURE.—We have often had occasion to note the excellent training given at the Chelmsford Laboratory by Mr. Houston and his colleagues. A reference to the examination list lately published will serve to confirm the good reports already given. In some quarters it is the fashion to deery such tuition on the ground that it is not practical. With

some experience of the work done there and of its results, we should rather be inclined to say it is nothing if it is not practical. The following programme of the work done in the July course of Horticulture will demonstrate this. It should be borne in mind that this course is intended for selected students who have already gone through a more extended course of training:—

DAYS.		Morning.	AFTERNOON.	Evening,		
		9—12 Laboratory Work,	1-5 Garden Work.			
MONDAY ,		Physiology of Plant Nutrition. Movement of Water in Plants.	Fruit Culture. Summer training of fruit-trees.	Visit to a private garden.		
TUESDAY		Water Culture Experiments.	Summer pruning of fruit trees.	Chemical lecture at 7.—Air in relation to plant life.		
WEDNESDAY		Physiology of a green leaf.	Summer pruning of bush feuits.	Botanical Ramble.		
THURSDAY	***	Transportation and storage of reserve food.	Flower culture. Bedding out.	Garden demonstration Spray- ing fruit trees.		
FRIDAY		Special processes of nutrition in particular groups of plants.	Potting of winter-flowering plants.	Chemical lecture at 7.—Water in relation to plant life.		
SATURDAY		Revision.	Visit to Nurs	ery Grounds.		
		SECOND WEEK	, July 13th to 18th.			
		Mornino.	Afternoon.			
DAYS.		9-12 Laboratory Work,	1-5 Garden Work,	Evenino,		
MONDAY	***	Physiology of Growth.	" Vegetable " Culture.	Visit to a private garden.		
		Formation of shoots and roots— Induced effects of training and pruning.	Preparation of Celery trenches			
TUESDAY		Sensitiveness of growing organs— Importance of suitable soil con- ditions.	Planting of "green crops."	Chemical fecture at 78 il in relation to plant life,		
WEDNESDAY	Fruits, their formation, development and ripening.		Tomatos; training and planting.	Social Evening.		
THURSDAY			Cucumbers: preparation of beds, indoor and out.	Chemical lecture. — Chemical compounds formed by plants.		
		section,				
FRIDAY		Examination of types of Lily, Daffolii, Iris and Orchis families.	Preparation of Mushroom beds.	Demonstration in Botunic g		
SATURDAY		Revision.	Visit to Melon an	nd Tomato houses.		
		THIRD WEEK,	July 20th to 25th.			
D.		Morning,	AFTERNOON.	-		
Davs.		9-12 Laboratory Work,	1 5 Garden Work.	Evening.		
мохрау		Natural Classification of Plants. Examination of types of Larkspur, Poppy, Brassica, Viola, and Car- nation Orders.	Budding Roses, Plums, &c.	Discussion at 7.		
TUESDAY		Hollyhock, Geranium, Pea and Rose families.	Potting of Orchids.	Botanical ramble,		
WEDNESDAY		Cucumber, Gooselerry, Saxifrage and Parsnip families.	Strawberries: preparation of bods and planting.	Budding competition.		
THURSDAY		Southower, Heath, Potato, Mint and Oxlip families.	Visit to a fruit farm,	Demonstration on drying and preserving plants, at 8.		

UNIVERSITY OF CALIFORNIA.—The report of the Agricultural Experiment Stations of the University of California for the years 1894 and 1895 chronicles much work done with regard to analysis and examination of soils and sub soils, and the possibility of improving and fertilising these for the better cultivation of certain crops. There are also included papers on California fruits, and Canaigre (Rumex hymenosepalus), Olives, &c. There is a section devoted to entomology, and the reports from the various stations are carefully tabulated and arranged.

THE HORTICULTURAL CONFERENCE at Chester, we may remind our readers, will be opened at 7.30 F.M. on Tuesday next, Angust 4. The Duke of Westminster will preside. Sir Trevor Lawrence, Eart., the Dean of Rochester, and Mr. F. W. Burbidge, M.A., are expected to deliver addresses. On the following day will be held the horticultural show, which is anticipated will be a great success.

HOME CORRESPONDENCE.

PANSIES AND POLYANTHUSES.—Mr. Douglas states that neither Violas nor Pansies can endure the hot, dry seasons of the London district. That is quite true, as it is true of many other plants during such seasons, as last year and the present, if no culture be given. When, however, I see how, under good culture, Violas thrive and bloom so charmingly at Hampton Court every year, I have to question the force of Mr. Douglas's conclusion. I have not seen Mr. McLeod's Viola garden at Dover House, Rochampton, this year; but last year, whilst still hot and dry, I did so, and I must say I never saw Violas massed in numerous colours, and making up a parterre-garden more truly beautiful, than was this garden then. Dover House is within a few miles of Charing Cross, and the soil is essentially dry and porous, but in no garden, even in Scotland, could Violas have been presented in more beautiful, vigorous, florescent condition than there. I did tell Mr. McLeod that, beyond bringing with him across the Border special knowledge of Viola culture, he must have brought in his train something of Old Scotia's climate as well. With respect to Polyanthuses, presumably raised from seed sown in the spring, Mr. Douglas advised they be now planted out. Poor "pollies" indeed that have as seedlings to be planted out this hot, parching weather. I always advise sowing seed ontdoors at the end of August, or early in September, the plants to stand the winter in the seed-bed, and then be transplanted in April, whilst the ground is yet cool and moist. I got a big batch raised for me in that way, and I had several hundreds planted out about the middle of April. They are now very strong, established plants, defying the drought, and will next spring make plants double the dimensions of those planted out in July will make. A. D.

VIOLAS.—Passing along a road in Reigate a week or two since, I was almost surprised to see growing in a garden good clumps of Viola cornuta and V. c. alba. These are so seldom seen now that their presence seemed to be like an unexpected meeting with old friends. I could not but think, on looking at the very compact growth of these old forms, how very much too many of our newer so-called Violas have departed from them. What will Viola raisers say to the suggestion that these former popular kinds be again used as starting points, with the object of preserving their undoubtedly very free compact habit, rather than in utilising the Pansy as a seed or pollen parent, and thus producing, as is now so largely found, a race of loose growing, large-flowered varieties, that have not the dense, compact, tufted habit in any degree. Raisers seem very largely to have overlooked, in producing new Violas, the chief use to which they should be put, to produce solid masses of flower, and producing this bloom continuously over a long period. Violas have been very much spoilt by the practice now so prevalent of showing them at exhibitions set up in sprays. Thus, in many cases, varieties are so utilised that have no fitne s whatever for bedding or massing purposes. Very likely, when employed to run loosely amongst other hedding plants, just as Verbenas do, these loose growers are suitable enough. It was somewhat odd, that in connection with the recent exhibition of the Viola Society at the Regent's Park, so much should have been reported concerning winners of prizes and names of the flowers staged for

exhibition, but nothing was said about the many varieties said to have been bedded out in the gardens. That is the test likely to create most interest, and to have the greater value. Some independent testimony on the results is desirable. A. D.

STARCH AND SUGAR CONTENTS OF POTATOS AND OTHER ROOT CROPS.—I am greatly obliged to Mr. J. J. Willis, Harpenden, and "A. D." for their courteous replies and valuable suggestions in this matter. It is one of very considerable commercial interest and importance. In crops such as Potatos we need a trade outlet to steady prices beyond what may be called the chances and caprices of the consumption of Potatos as a constant ration in our daily diet. It is more than doubtful whether such perishable food as Potatos follow the usual supply and demand in regard to consumption and price. On the contrary, our glutted markets often seem to prove that the cheaper the Potato the fewer are used for food; and hence the greater necessity to find other outlets for Potatos, such as their conversion into starch, sugar, spirits, yeast, pork, butter, cheese For the diversion of Potatos to other uses, and their profitable devotion to other purposes, it seems most desirable to increase their starch or sugar contents. It may be true, as "A. D." points out, that the Germans, by special raising of varieties or peenliar culture, have added to the starch ratio of the Potatos that they grow for manufacturing purposes. It can, however, hardly be that they owe much of the extra starch-ratio to their climate. Some forty years ago quantities of l'otatos were grown in Scotland for conversion into Potato-starch and arrowroot, and the new industry was said to have proved very profitable. It would be interesting to know if it still exists, and how far it has extended. The process was very primitive and simple, as I remember it. Potatos were washed and smashed by simple machinery, the flour or starch washed and allowed to settle, then dried, packed, and distributed as starch, and used for food and other purposes. No complaints seemed to have been made as to lack of a good percentage of starch and substantial profits. Though much outery was raised as to the adulteration of foreign arrow root with home-grown Potato-flour, Mr. Willis seems to furnish cultivators with the secret of substantial Potatos, and turning this into solid and sure commercial advantage. Potatos though safer stores for food, and more durable than most fruits, are yet very perishable commodities. Their ability to may from early are also also also are also also are also are also are also are also are to grow from early eyes, also results in lower-ing the quality of their food supplies. Every change of temperature, and alteration of moisture in earth or air, or Potato-store, tends thus to waste the food stores of the Potato. Hence the vital importance of converting its food contents so far as possible into dry goods, starch, sugar, spirits, ferments, &c. Mr. Willis shows that not only the nutty flavour of the Potato, so highly prized, but the amount of starch, depends on the quantity of potash taken up during growth. During my lectures on Potatos for County Councils, I have constantly impressed upon my audience that weight meant quality, and that both measured starch or sugar-contents. It is pleasing to measured starch or sugar-contents. It is pleasing to have these views confirmed by Mr. Willis in these remarkable words:—"The Rethansted experiments further show that high specific gravity in Potato tubers and high percentage of dry matter go together." The total amount of dry matter produced per acre is considerably increased by mineral manures containing potash alone, kainit salts, or sulphate of potash, but very much more when the mineral and nitrogenous manures are used together; thus, the weight of the dry substance of tubers was, without manure, 1353 lb. per acre; with purely mineral manures, 2384 lb.; and with the mixture of mineral and nitrogenous manure more than 4000 lb. per acre, or 1½ tons. Another practical point of great moment is mentioned by Mr. Willis. From 80 to 85 per cent. of the total potash in Potato tubers is found in the juice, and about two-thirds of the phosphoric acid is also found in the juice, and as two-thirds of the nitrogen is found in the albuminoids in the juices, it follows that if the mode of cooking the Potato is such as to exclude these constituents of the juice from the food product, there is a considerable waste of nutritive matter and nutty flavour. D. T. F.

THE WEATHER IN SHROPSHIRE.—We have witnessed a decided change in the weather in Shropshire during the past week, for during the four days ending July 25 we have registered 2 inches of rain, and there is every likelihood of another downpour while I am writing. During all my gardening career I have never witnessed vegetation suffer so much as this

year, Peas especially are generally a failure, and buyers in Shrewsbury have had to send to other counties for them. It is sail by persons sixty years of age that they have never seen the water in the river so low as at the present time, and to no county will the rain be more welcome than to Shropshire. Geo. Burrows, Berwick Gurdens, Shrewsbury.

THRIPS ON PEAS.—It may be of value to growers of late Peas to know that I have made two trials in the Aughton County Council experimental ground, in order to ascertain how this pest might be eradicated. A liberal sprinkling of the haulin with freshly-slaked lime has quite answered my expectations, for the plants are now practically freed from the insects, and yielding a good crop of Peas. In the second trial, I lb. of soft soap, I quart of petroleum, and 26 gallons of hot-water were used, and this, too, kills the thrips; but lime is the best means for the purpose. The mixture may be applied with either a time rose watering-can, or by means of a spray-pump. E. Thomas.

STANDARD AND TRAINED FUCHSIAS. - Few ersons who have passed through the little town of Egham in the summer time can have faile I to admire the standard and trained Fuchsias in the front garden of The Lines, Mr. Wm. Paice's residence. The stindards vary in height from 6 to 10 feet, and are of ages ranging from ten to twenty-one years, and these have a very imposing appearance, many of them possessing very fine heads of bloom. There are, besides these, Fuchsias which form arches, and cover a bower some 10 feet in width, several feet high, and of e-msiderable length-leading from the front-door to the entrance-gate, which are really very telling and effective. Most of the plants are cultivated in jots and plunged in the ground, they are not closely prunedin, when grown for this purpose, so that the shoots soon cover the trellis and become effective very early. The plants form capital summer screens for trelliswork of various descriptions. The Fuchsia is a very telling plant, when planted in a conservatory, and the branches allowed to ramble and droop in a natural manner from the roof and wall; in fact, few other kinds of plants are more so. Miss Marshall, Beaconsfield, and corallina seem to be the best varieties for bower-work, having a pendent holt, and making shoots of considerable length. For the forming of standards beside those named, there may be added fulgens, serratifolia, and corymbiflora. Is it not a little singular that the Fuchsia is so neglected as a pot plant in the present day, whereas some thirty years ago grand specimen plants were commonly met with at exhibition and elsewhere, but now one scarcely ever meets with anything worthy of the name of specimens. It is surely time, the taste for the superior culture of the Fuchsiv should again be to the fore. Edward Bennett, Queen's Road, Egham.

STRAWBERRY WATERLOO, - Though rising to the high estimate of many of our authorities as to the merits of this densely-coloured, attractively-shaped Strawberry, I confess to feeling sorry to hear Mr. J. Wilson strongly voicing a rather wide feeling of disappointment with Waterloo in his assertion that he could neither grow nor fruit it at St. Andrew's, and had therefore to discard it. comfort Mr. Wilson to learn that though the Waterloo has been with us for some years, and has been called popular, it can hardly be saul to have reached the latter phase as yet, though its colour and specific gravity alike give it special weight in the dessert. It is not, however, the first time I have heard or seen its somewhat erratic fruiting. But in not a few soils and situations it has grown too much rather than too Some of the finest crops of Waterloo I have seen have been on rather light than heavy soils But then the soil has been made specially firm, and what is called hard planting has been practised. However, if any market grower has succeeded in growing profitable crops of Waterloo by the acre, 20 or 50 acres, as they have Paxton, President, Royal Sovereign, British Queen, it would be most interesting to hear of them. The dark, almost black, colour would check their sale at first; but this overcome, the Waterloo ought to become popular, if it can be made to fruit as heavily on a large scale as either of those named in competition with it in this note. As the male or female parent in the cross-breeding of Strawberries, we are already greatly indebted to the Waterloo, and shall probably be much more so in the near future. In this connection the Waterloo may be correctly described as an abnormally vigorous parent, handing on much of its prepotency to its successors. And neither is this abnormal fertility confined to their fruits, but overflows into the abundance and vigour of their runners. Can the purplish tinge of the latter prove a factor in their vigour ! D. T. Fish.

GRAPE GROWING ON SANDY SOILS -But for the fact of my name being mentioned in the paragraph on this subject. I should have allowed the matter to pass; yet it is of great interest to many growers of Grapes, and coming from the fortile pen of so keen a critic as "A. D.," I should like to make a few remarks. First, however, in justice to the makers of the Patent Silicate Manure, it should be noted as such. Silicate soil or sand being a natural production, and no doubt soil or sand being a natural production, and no doubt good for Vine and Grape growing, should not be classed as a manure. All soils are manures in one sense of the word, but the Patent Silicate being a fixed chemical mixture should have been so named by "A. D." Very few persons may be aware of the great quantity of sand in most kinds of soil, especially loamy soil, which is supportance would give nearly helf sand which in some instances would give nearly half sand in the upper 2 feet of the surface. It is to the presence of sand that I attribute much of the success attending Grape culture. Again, if sand lies below the loam, followed by gravel, all will be well ; but if, on the other hand, gravel comes next to the loam, it is a hungry soil. Not only Museat Vines, but all other varieties enjoy sand in greater quantity than we can always afford it. Such sandy soils, while the Vines are young, require a slight mulching of litter, &c., to keep the snrface from being rendered too dry, which, if it be not done, greatly favours the spread of red-spider on the Vines. A sandy surface soil will hold the surface-roots well if it be properly attended to. Then all persons will know that this is due in a great measure to the fact that all manures are absorbed and held by the surface soil. A great contrast, indeed, is the soil with which I have to deal, to that of some I am acquainted with—a clayey soil - the top spit being of a very tenacious sort. Such a soil will never grow either Vines or Grapes for any great length of time, for the water must have a free passage through a soil, or the roots will decay in a wet season, or in the winter; the result being a wet season or in the winter; the result being e ther weak growth, or undue shanking. I have found that sand-tone placed in a border in lumps always attracts the roots of Vines. The soil here if turned up shows much sand after rain, the sand being nearly white, and Muscat Vines revel in such soil. Some thirty canes planted last Lady day are now doing grandly, a bunch or two showing on them being good in berry, and every berry properly stoned, the bunches weighing 1 lb. These are taken without injuring the growth of the rods, for they are on the young rods, the Vines having been cut down to three buds. How peat would grow a crop of Grapes is another question; yet if on a sandy bottom I should believe, with due cultural attention, that the Vines would do well. I happen to be acquainted with a good Grape grower-Cooper, of Sunninghill, near Ascot, and although I do not suppose that he has thought much about the sand present in his ground, I have no doubt that it is one cause of his success. Too often we "growers" call a soil poor, and very often, too, because of the sand that is in it: while all the same, it is, perhaps, one of the best for the V ne, always providing it has depth, with good natural drainage. It by means follows that because Vine roots run into clay that they like it, and certainly it is against good To keep the roots out from getting Grape-growing. into a clay bottom, the very worst for the growth of the Vines and for the fruit, the land should be well cultivated at the top. Stephen Castle, Bottesford Vineries, Nottinghamshire.

MESSRS. CANNELL'S PRIM-ROSES.

Messes. Cannell & Sons send us a reduced copy of the imposing Certificate they have just received from the United States of America for the collection of Chinese Primroses exhibited by them at Chicago. It runs thus "The United States of America, by Act of their Congress, have authorised the World's Columbian Commission at the International Exhibition held in the City of Chicago, State of Illinois, in the year 1893, to decree a medal for specific merit which is set forth below over the name of an individual judge acting as an examiner upon the finding of a board of international judges, to H. Cannell & Sons, England, Swanley, Kent.

Exhibit: Collection of Primroses. Award: For a fine exhibit of Primula sinensis fimbriata.

Among the named varieties the following merit

special mention: Cannell's Pink, a new and wellestablished strain; the flowers are very large, well formed, and of a decided rose-pink colour; the foliage is Fern-like, and the habit of the plant is good. The Queen, a strong and well established variety, having foliage of Acanthus like appearance. The flowers are very large, perfect in form, and borne on stout stalks, which stand well above the foliage; the flowers are snowy-white in colour, and slightly crested. In this type the greatest advancement that has as yet been attained in Primula sinensis is shown. Lilacina, a very free-flowering variety, of extra-good colour, compact habit, and strong Fernike foliage. Market White, a typical variety, of strong compact habit; the flowers are ivory-white in colour, and very large. White Perfection, a very distinct and vigorous-growing type; the flowers are pure white, and stand well above the foliage. Crimson Velvet, a well-established, free-flowering variety; the flowers stand well above the foliage

Henry Ffister, individual judge; Robert Craig, President Departmental Committee; Geo. R. Davis, Director General; T. W. Palmer, President, World's Columbian Commission; Jno. T. Dickinson, Secretary, World's Columbian Commission; John Boyd Thacker, Chairman, Executive Committee of Awards."

NURSERY NOTES.

THE READING GLOXINIAS.

ONE of the chief features at Messrs. Sutton's at the present time is a beautiful exhibition of their selected strain of Gloxinias. Those now in flower consist entirely of plants raised from seed this year, and they afford an excellent object-lesson in culture combined with rapid development, thus demonstrating, firstly, that capital plants can be grown by treating them as annuals, the plants being very floriferous, better, in fact, for decoration than if larger and older; and secondly, that within six months from seed good material can be secured, conspicuous for vigour of growth. A few of the best and most striking coloured varieties are kept under name. There is abundant variation in the colouring of these scedlings, and the same good liabit is common to all of them. Of those which are named is the pure white "Her Majesty," which is an ideal type of a good Gloxinia, having purity, size, and a good form, large wide lobes, with an unusually long and well expanded throat and substance. The stems are short and stout, bearing the blossoms quite erect without any kind of support. The leaf growth is also remarkably fine of the G crassifolia type, but more rounded in form, thus easily covering the pots, and partially hiding them without: xtending very far beyond the rims, making the plants excellent decorative subjects, without any suspicion of drooping, as seen at times in the ordinary forms of Gloxinia. Others possess the same good quality as the foregoing; that named Empress of India is notable by reason of its rich velvety-purple colour, which is extended well towards the margins of the lobes; Duchess of York is of a like colour, but with a clear white edge to the lobes; whilst in Duke of York the purple is replaced by a dark shade of crimson, with the edging of white rather broader; Azure Blue is very well described by its name, the ground colour being pure white, with the sky-blue covering about one-half of the lobes towards the margins; Princess May is of the same type, the ground colour pure white with rise and pink alternating in the lobes towards the throat, and like the foregoing, is a very distinct variety; Reading Crimson (Crimson Velvet, would not be at all inappropriate), which is strikingly rich in colour. The spotted, laced, or reticulated forms are all tending towards the same size and substance, as noted in "The Majosty." This strain of Gloxinia is well suited or sowing during the summer to flower during the ensuing winter-a method of treatment which has proved successful in many instances. These seedlings now in flower bid fair to last well into the autumn. H. U.

Mr. John Robson's.

Altrincham and Bowdon lie in juxtaposition, and form together a favourite suburban resort for Manchestrians, not only to visit, but to dwell in, the climate being clear and salubrious, and vegetation thriving accordingly. It is not very many years since Mr. John Robson planted his nursery down there, and his business has been increasing year by year. His nursery quarters are well stocked, and the demand this year, consequent upon the ice-bound weeks of 1894 5, has been such as to make up for the past season's business deficiency. He has besides a large quantity of glass-houses, covering quite an acre of his land, and from out of them he despatches great quantities of cut flowers as well as plants in pots.

Roses grown in a house 100 feet long have done splendidly, those which are planted out yielding a great crop of flowers, coming in most useful for cutting; and a collection of Tea Roses in pots round the house were doing well. Camellia plants in a very large house have been out back, as being less profitable than some other subjects, and decorative Palms and Ferns in great variety have taken their places. In other houses are Cannas, now in great variety and in captivating colours; quantities of Eucharis and Pancratiums, whose flowers are useful in floral decorative work; Pelargoniums, Petunias, more particularly the double white variety with flowers of frilled edging, much used for bouquet work. Vallotas and Nerines were in fine condition, as well as a large collection of Sikkim Rhododendrons and their hybrids, and many other miscellaneous flowering plants.

A house of Tomatos is particularly inferesting, quite 120 feet long, and the plants planted out in turf, and trained like Hollyhocks to a height of quite 10 feet. The lower lialf of the Tomato plants bore an immense crop of large fruits just ripening, and a second crop was showing which must be rapidly harvested, because of the Chrysauthennums that find a home there after October. The variety exclusively grown is the selected Orangefield, which in the Manchester district has been grown for more than thirty years. The seed of Orangefield was received by Mr. Robson from Mr. Smith while the latter was gardener at Longford Hall. The fruit is large and beautifully coloured, and only selected ones are saved for seed purposes, the remainder going to the market.

The Orchid houses are very well managed, the plants generally in excellent health, being much improved since they were placed under the charge of Mr. J. Evans. They consist of the chief among the species and varieties that find most favour among Orchid-growers.

The Dendrobium-house was filled with clean, healthy plants, most grown in holed pots and suspended baskets. The plants of Dendrobium Wardianum were strong an I faultless, the white form doing well in limited pot-room; D. nobile in many forms and crosses; D. Dearei, extra well-grown; D. form sum, D. crasinode album, and many others were remarked during my stroll through the Orchid-houses, Mr. E ans, following the practice of Mr. O. O. Wrigley, of Bury, sprinkles the floors and benches with water in which soot and lime are mixed, doing this twice a week, and apparently, the practice induces vigour without giving rise to "spot." In this house also was found a good assortment of Phalenopsis, the plants having fine leaves, excellent roots, and giving a promise of good flowering. Many very vigorous plants of Angraecum sesquipedale were remarked. Quantities of young Crotons and Dracoming were growing on the tables under the shade of the Dendrob's. Both D. Phake ropsis and D. Dearsi got little water at the root, an I they are exceptionally vigorous.

A large house is chiefly occupied with Cattleyas, Lelias, and Cypripedium. The Cattleyes are in great vigour; some good Giskelliums being in flower, and then the sheaths of C. Mendeli, of C. labiata, C. Percivallians, very prominent. Levia teachross. L. crisps, and L. xunthins were in robust health, and there are scores of strong L purpurate of good types. Cypripediums were found in qure-

tity, and amongst some very good C. Curtisi in flower, we noted C. cenanthum, C. superbum, C. Gowerianum, C. Leeanum giganteum, C. Polletianum, C. Arthurianum, C. Saundersianum, &c. Cymbidium cburneum were remurked in scores of fine plants. A particularly healthy let of plants of Odontoglossum grande was observed in this house; a large stock of plants of Cologyne cristata and its varieties is grown for cut flowers.

The span-reofed Odontoglossum-house is full of vigorous plants. Notwithstanding the enormous quantities imported, the demand for cut flowers of O. crispum is so great as to pay the grower, even supposing he cannot sell the plants. Out of the thousands here, some good varieties have been secured, which, as most nurserymen know, find a readyenough sale at a price. The cool treatment and the pleasing moistness of the atmosphere produce here very vigorous plants. The best O. Pescatorei, grown in suspended pots, are well furnished with branching flower-racemes. Along with these are the brilliant vellow Oncidium St. Legerianum; the beautiful O Marshallianum, which summers best in a clima'e of this kind; O. varicosum Forbesii, often burned with strong, dry heat; O. macranthum, and great pieces of Epidendrum vitellimm. I was glad to notice some premising Masdevallias revelling in the cool, moist house.

The whole of the plant houses are substantially built, and in good order of keeping, without anything being ent to wiste in the way of needless expenditure; and the stite of the general stock is such, that it will surprise many a composseur. J. A.

SOCIETIES.

ROYAL HORTICULTURAL.

July 23. An ordinity meeting of the Committees of the Society was held on Tuesday last in the Drill Hall, Westminster—As is used during this month and next the exhibits calling for distinctive awards were not numerous, but there was a good display. Hardy flowers formed the greater part of the show, if we except for the moment a very large group of Begonias, and a smaller one of Pelargoniams. This occasion was also the meeting at which it had been arranged there should be made a display of Succulents and Cachecous plants, and there were several very interesting collections staged. A becture upon the subject of these plants was given in the afternoon by Mr. Cuarrang, an enthusiastic anatom.

There was a considerable quantity of fruit staged, but it was principally from one exhibitor.

The three awards that were made by this committee were a First-class Certificate and an Award of Merit to new Gooseberries from Messas Varant; and an Award of Merit to a fine variety of the Red Carcat from Mr. Broken of Jersey. A new Plancknown as the Burbank, and possessing very distinct characteristics, was interesting.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs, Jno. Freser, John Laing, H. B. May, H. Herbst, R. Dean, Geo, Stevens, Robb. Ozven, Jno. Jennings, J. Fraser, J. B. Pawle, Goo, Nicholson, Geo Gordon, J. T. Bennett Poë, Chas E. Shea, Chas. E. Pearson, H. J. Jones, Ed. Beckett, H. Cannell, Harry Turner, Chas. T. Druery, O. Thomas, and H. Honeywood D'Ombrain.

An Award of Merit was recommended to Messrs, Barra & Sos for Delphinium Zazil, a most distinct variety, of sulphur yellow, flowers small but numerous, and produced from long spikes. Upon first sight the spikes of flowers resemble in appearance those of an Ouridhum.

Mr Geo. Wythes, gr to Eurl Percy at Syon House, Brentford, exhibited spritys of Campaoula pyramidalis alba compacta, an improved white variety, in which the size of the flower as well as the habit of the plant is better than in the type (Award of Merit)

A number of varieties of double Hollyhocks was shown by Messrs, Weira & Brixno, Saffron Walden, in several shades of colour and white. Ozid, a very large double is so variety, we deceanmentle for Award of Merit. (A Bronze Binkston Med all dso to the group wis recommended.)

Messis, P. Byrack Son, King St., Covent Gurden, London, W.C., in advantist rate display of hirdy flowers. Covenpils grandifier and Golfardies were very good. Hirder one Phloces in numerous good varieties were included; and Alstromeric aurantives, Allium pulchellum, and A. p. fla um, Liloum tigetnum sinense, and other good, things a lso (Silver Broksian Mettl).

Mr. Tuos, S. Wage, Hale Farm Nurseries, near Tottenham, Mr. Thos. S. Warr, Hale Farm Nurseries, near Tottenham, made a display of Pentstemons, which were exhibited in much variety and in bunches of good flowers. The varieties Mrs. Empson, Miss Patey (coral searlet with silver throat), and Lord Hillingdon rosy blac with silver throat), were especially noteworthy. Mr. Warr's exhibit consisted also of a large number of miscellaneous hardy flowers, which, together with the Pentstemons, effected a very good display. Lathyrus latifolius albus, flowers of Gaillardia grandiflora hybrida, and a number of Carnation blooms, were observed (Silver Flora Medal).

Messrs, Young & Dominson, Stevenage, Herts, exhibited flowers of tuberous rooted Begonias (single and double), together with foliage of same upon a groundwork of moss.

A group of a remarkably dwarf and dense habited variety of lvy-leaved Pelargoniums was shown by Mr. J. HAZELEY, Station Road, Hampton. It is named Mozoni, and appeared to have at least a score of breaks upon a single plant in a 3-inch pot.

From Messrs, Crarris & Son, Tanbridge Wells, were shown three plants of a variegated form of the Maidenhair tree (Ginkgo biloba), also a few plants of Hyperieum aureum

A large group of tuber ansmooted Begonias, from Mr. H J. Jones, Ryccroft Nursery, Lowisham, constituted a most unusual feature. Its characteristics were such as are usually seen at the Temple Show, or large provincial exhibitions at which the arrangement of artistic groups is made a specialty, rather than those we usually associate with the Drill Hall In length it was almost equal to half the extent of the hall, of considerable breadth also; it was arranged on the floor of the hall and under the wall. Though the primary object was to exhibit Begonias, means were taken to do this as effectively as possible, and to this end very free use was made of such plants as Crotons, Palms of a graceful habit, Caladiums, Ferns, Asparagus and Ficus. The front margin of the group had a decidedly wavy outline, and in the small groups thus caused were placed dot plants of various kinds. The double-flowering varieties of Degonias were kept kinds. The double-flowering varieties of fergomas were kept together in a measure, as were also the singles. No effort was made to show particular named varieties, but all were made subservient to effect, and, we think, with much success. The disposition of the plants was tasteful, and the specimens used were choice Gold Medal.

Sprays of flowering shrubs from Messrs. Jas. Vieten & Suss., Royal Exotic Nursery, King's Read, Chelsea, repre-

sented Stuartia pseudo-Camellia, a single white flowering shrub, the imopened buds upon which greatly resemble a Camellia at the same stage; Corylus colurna in fruit; Lava macrostachya, bearing an abundance of it ornamental spikes

macrostaenya, nearing an abundance of its ornamental spixes of blooms, and Eueryphia pinnatifolia, an exceedingly ornamental shrub, with pinnate foliage and white flowers.

A grand display of Sweet Peas and Dublias was in de by Mr. J. Walker, Thune, Oxon. The Sweet Peas exhibited were arranged tastefully, and together with the more formal. Dahlias made quite a show (Silver Burksun Medal).

Mossrs, H. Cannell, & Sons, Swanley, Kent, exhibited

some plants representing an uncommonly dwarf type of Antirrhimm. The flowers were pure yellow, purple, crimson and yellow, and other shades of edour, some also

were striped in bizarre fashion.

A capital exhibit of hardy flowers was made by Messrs WM. Curnus & Sons, Highgate, London, who staged a number of varieties, including Echineps spherocephalus, Eryngium amethystinum, Gaura Lindheimeri, Hyncinthus candicans, Romneya Coulteri, Acanthus candelabra, Crinum Powelli, &c. Also a great number of varieties of border Carnations, staged on a groundwork

of moss (Silver Banksian Medal).

Messrs. J. Carler & Co., High Holborn, exhibited a few plants of a very pretty single flowered Petunia named Queen of the Rose, furnished with larger, brighter flowers than the type.

A group of plants of the zonal Pelargenium King of Denmark was staged by Mr. R. Jensen, Mansfield Hill Nurseries, Chingford, Essex. The variety, which has flowers of a salmon-pink colour, was given an Award of Merit in May. The plants on this occasion were well grown (Silver Banksian Medal).

CACTL

Mr. C. A. Brona, Croydon, exhibited a small collection of Echinocactus, Opintias, and Mamillaria. We remarked the We remarked the fechnocactus, Opinitas, and Manniaria. We remarked the fur-looking, yellow-spined Echinocactus Grusoni, 8 inches in height, with brilbant yellow spines; E. multicostatus, whose numerous small furrows take a scrpentine direc-tion; E. ornatus, with a skin speckled closely with white: the long curved spaned E. crispatus; the yellow flowered E. Ottonis, and E. cormgerus, with vicious-booking spanes; several species of Cereus, Opuntia, and Filocorus were also

Mr. PRITCHARD, 78, Godwin Road, Forest Gate, showed a very large collection of Cactaccous plants, including species of great rarity. Opintias were largely represented, which, whilst showing a certain degree of similarity in form, had great diversity in minor points. The following were noted in fair-sized specimens, 0. decumana spinostor, 0. candelabriformis, 0. clongata, O. Rafinesqueana, O. bicolor, 0. vulbriorins, O. elongati, O. Runnesqueaua, O. bicolor, O. vul-garis, O. nigricans, O. humilis, O. brachyartha, O. glomerata, O. tunicata, O. cylindrica, O. arborescos, O. allicans, O. Engelmanni, the noble O Tauri major, the s'ender-stemmed O. aurantiaca, and the less slender O. dejecta, O. polyantha, O. armata argentea, and O. monacautha. Of Rhipsihs shown, there were noted R. crispata (?), R. c. var. purpurea, and R. funalis. Phyllocactus species, at P. Russellianus, P. mtens, P. Johnsoni, P. crenatus, P. attirons, and P. unguliger, were shown, but none was in

bloom. Specimens of diverse species of Echin eacti, Corons, and Manullaria were nuncerous. A few species of Anh domining and Echinopsis were also remarked, mostly forms that are and Echinopsis were also remarked, mostly forms that are still very rare in gardens. The Cereus included such tall growers as C. azurens, C. rostratus, C. repandus, C. grandiflorus, C. Baumanni, C. maerogomis, C. Mallissoni, C. McDonaldi, C. triangularis, and C. Ilagelliformis. The plants in this collection numbered 220.

Mrs. Chilton, Wealdstone, Middlesex, showed a smaller collection of these plants, consisting mainly of Echinocactus, Mamillarias, Opuntias, and Cereus, all small, but apparently healthy. A nice example of Phocerus scrills was noted Messis. Cannell, & Sons, Ilmon of Flowers Swanley, had

Messrs, Cannell & Sons, Home of Flowers, Swanley, had a more numerous collection than the last named, consisting, too, of the more popular species. Nice examples were remarked of Echinocactus McDowelli and E. cornigerus;

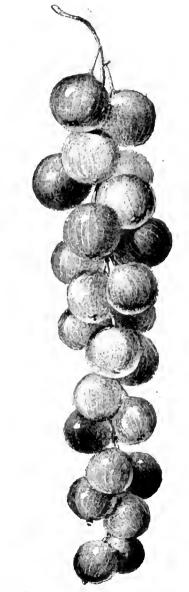

Fig. 26.-10 b current "The comet." (See Report of Royal Horticultur d Society's Meeting, July 28, 1896, p. 137.)

of Mammillaria bocasana, M. recurvi, and M. spinosissima, of Pilocircus senilis, Opunta um rodasys, Euphoriasmat, of Pilocircus senilis, Opunta um rodasys, Euphoria Fourmen, Haworthia longianstat), two uice examples. Agave Victoria Regina (figured in Gard Chona, June 19, 1880, p. 788), A. coecinea, A. maculata, Alor plicatilis, Pachyphytum Sieboldi, Gasteria verrucosa, Heelitea Ghiesbreghti, Dyckia longifolia, several Mesembuyanthemums, &c.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messis. Las. O'Brien (Hon, Sec., F. W. Moore, De B. Crawshay, E. Hill, J. Douglas, W. H. White, H. J. Chapman, W. Cobb, H. M. Pollett, T. Statter, and S. Courtauld. There was but a small show of Orchids.

Sir TREVOR LAWRENCE, Burford, Dorking, exhibited a few rare botameal plants, some of them making their appearance for the first time—Of these were Geloutoglossum aspidorhio num, Lehm., a species with numerous graceful sprays of

ye'low and brown flowers, with large and curiously formed pure white his, more or less softed with purple. The individual flowers somewhat resemble those purple. The individual flowers somewhat resemble those of O. blandum and O constrictum, from which, how ever, it is botanically distinct (Award of Menty; Dendro, bium curviflorum, Rolfe, one of the handsomest of the Aperuma section of Dendrobium. The plant has the usual compressed growths of the section, and bears rather showy and curiously-formed white, heat-shaped, curved flowers, with yellow blotch on the lip (Botanical Certificate. Sur Transcrata Rubschi, of the M grandiflora class; Masdevallia infracta purporea, with twenty flowers -a charming little plant; the singularlooking Pendrobiam revolution, whose flowers opened in April, and have been in good condition ever since, and may last a considerable time longer; and Cypripedium 🔺 Chas. Steinmetz, a protty hybrid between C. philippinense and C. Lawrenceanum.

Messrs, J. Veirch & Sons, Royal Evotic Nursery, King's Road, Chelsea, again showel the handsome Cattleya. Atlanta (not Atlanta), which they first exhibited at the Royal Hortenthural Society, August 14, 1891. The plant is of neat habit, the flowers large, and way like in substance; sepuls and petids rose, closely veined with rose-purple; the lip (which although large in size, follows somewhat the form of that of C. Leopoldi bright purplish majenta. Its nearest affinity is C. . Fowleri, recently exhibited, but C. Atlanta is larger, richer in colour, and shows more clearly the characteristics of the lip of C. Leopoldi (Firstchase Certificate). They also showed their new hybrid Masden Messrs, J. Veitch & Sons, Royal Exotic Nursery, King's nore clearly the characteristics of the lip of C. Leopoldi (First-class Certhicate). They also showed their new hybrid Masdevallia × Ajax (A thel oni × Peristeria), a remarkable cross, with wavy flowers with a ground colour of ye'low, and thickly set with reddsh-brown papille, which along the veining of the sepals also form three red brown lines. The tails are of chocolate-brown colour, and the inner surface of the upper sepal yellow, with purple lines; hip purple (A ward of Merrit). Also the white Cyntingdium. white Cypripedium & Brysa (Boussicranum & Sedeni candidulino). Mossus, Tuos, Carpes & Sox, Tunbridge Wells, showed a very handsome group of Disa grandiflora, excellently grown, well-flowered, and showing great variation (Silver Banksian Medal).

W. C. CLARK, EMp., Orleans House, Sefton Park, Liverpool, W C CLARK, Eag., Orleans House, Setton Fark, Liverpoor, exhibited Cypripedium 8. Harrisander (Harrisanum 8. Sanderianum), a very distinct and pretty hybrid, showing the compressed lip and curved wavy petals of C. Sanderianum in a marked degree. The upper sepal was greenish white, in a narked degree. The upper sepal was greenish white, with numerous dotted and feathered chocolate lines. Petals curved and narrow like those of C. Sanderianum, but shorter, given at the base, spotted with chocolate spots, the rest brownish rose, getting lighter towards the tips; lip shining dark red brown (Award of Merit). Mr. CLARK also showed a good example of Cypropedium × Mabellia (superbiens × Rothscholanum). Rothschildianum)

Major Masox, The Firs, Warwick, sent a flower of the true Cymbodium Parishii Messrs, F. Sanden & Co., St. Albans, staged a small group of Cypripelium & A. de Lairesse, C. & Palersoni, C. & A. R. Smith, C. & Massaianum, C. & Lord Derby, the blue tinted Calanthe - Eaucheana, a nice variety of Odontoglossum crispum, Acropera lulcola, Restrepa antennifera, R. elegans, Pholidota oboyata, Dendrobium bracteosum, and Aganisia ronoptera

W. Conn, Esq., Dule de, Tuobridge Wells (gt., Mr. J. Howes), showed Miltonia vexillaria, Duleote variety, a large, bright, rose-coloured form, with purple rays on the base of the lip and petals.

Messis, W. L. Lewis & Co., Southgate, N., sent Cattleya granulosa Schofieldiana superba, and a very remarkable variety of it, which is said to have come with C. bicolor, and which has a hp in which the isthmus and the front lobe are very narrow; and M. Seava, 164, Camberwell New Road, exhibited several remarkably tine photographs of groups and single specimens of Orchids in which the subjects were represented with accuracy (Vote of Thanks)

Fruit Committee.

Present: Philip Crowley, Esq., Chairman; and Messis T. F. Rivers, A. F. Barron, T. J. Saltmarsh, J. Wright, A. Dean, J. W. Bates, C. Herrin, Geo. Wythes, F. Q. Lane, H. Bilderson, J. Smith, Roht, Fyfe, G. Norman, Jos. Cheal and G W Cummins.

Mr. Jas. McIndoe, Hutton Hall Gardens, Guisborough, exhibited three trees in pots of the new Burbank Plune, exhibited three trees in pots of the new burronk Fign. This is a very extraordinary variety, with particularly distinct foliage and habit. It appears to be an uncommonly free cropper, and many fruits upon the specimens shown were developed from dormant eyes in the old, hard wood close to the base. It is a yellow, almost round truit, and from some fruits of Kirke's that had been grown under sometar applicants to the Burbank, it is evident that the similar conditions to the Burbank, it is evident that the latter is a very early-fruiting variety. The fruits were not ripe, but ripe ones are promised for the next meeting.

From the ROYAL HORDUCLUBAL SOURTY'S GALDERS at Chiswick were shown Early Rivers Peach, from open, unprotected wall, also Nectarine Newton, and a fine coloured Peach at present undetermined.

A wonderfully large Red Currant was exhibited by Mr. H BEAKER, nurseryman, of Jersey The frint was from a seed. ling raised by a Jersey anatour some fifteen years ago. Its and raised by a derivey anadour some inteen years ago. Its abuse from its unusual productiveness, size of berry, and length of bunch. As many as twenty-six large berries, have, it is sud, been observed upon one bunch. The variety is illustrated in fig. 29, which has been made of exactly the natural size from sp cimens sent by Mr. BECKER to this office. The variety is to be known as "The Comet," and an Award of Merit was

to be known as "The Comet," and an Award of Merit was extended to it on Tuesday last.

A large tray of fruits were shown of a new Gooseberry named Langley Beauty, raised by Messrs, Vetrent, from a cross between Rollway and Yellow Champagne. It was intended to combine the larger berries of the former with the upright habit of the latter. The fruits, as exhibited, were large bears of fine flavour. the upright habit of the latter. The fruits, as exhibited, were large, hairy, of decided yellow hue, and of fine flavour. Langley Gaze is another new one raised from Pitmuston Greengage and Telegraph. The result is a white or transparent, amber-coloured berry of moderate size, smooth, and of good dessert flavour, and very sweet. In this case also it was desired to combine upright habit with size, and flavour of fruit. Judging from a few branches of this variety that accompanied the barries, it is evidently a very free cropping

Messrs, Jus. Veite i & Sons were also responsible for a Mesers, J.G. Verr 1 & Solve were and respired to the large exhibit of fruit consisting of Gooseberries, Cherries, and a few other kinds. There were one hundred varieties of Gooseberries in single dishes, and judging by the quality of those staged, the unusual drought has had less effect up in the size of these berries than might have been supposed. Among so many varieties it is difficult to select any for Among so many varieties it is uniffer to select to year special mention, but the following fine ones were observed in good condition: Scotch Nutmeg, a small but highly flavoured berry of very dark colour; Dan's Mistake, a large smooth-skinned berry, excellent for culinary purposes; Laneashire Lad, a well-known red berry; Early Rel H dry. Yaxley Hero, a light red berry of good quility, and a free cropper; Ironmonger, an exceedingly dark berry of small size and good flavour; and Whinham's Industry. Of yellows, the fine variety Broom Girl was noticed; also Rumbullion, a the nie variety Broom Girl was nonced; also talinomial, a good late dessert variety, rathersmall in berry; Yellowsmith, Garibaldi, a very distinct one in colour; Early Sulphur, and Prince Arthur. Of green berries the largest is Surprise, then there were Green Lancel, Alma, Fear'ess, London City, &c. There were a few whites also, including Whitesmith, Queen of the West, and Patience.

A few early varieties of Plums, such as Early Prolific,

A rew earry varieties of Profis, such as Early Profife, Early Favourite, and Early Greenguge; Cherries, Lite Duke, Morello, and Planchowry—the litter an excellent lati-variety; early Apples and Pears, and white and red Cur-rants completed the exhibit (Silver-gilt Knizhtian Medal

Mr. JNO CROOK, Chard, exhibited four dishes of Gress-

Mrs. Abbot, South Villa, Regent's Park, N.W. (gr., Mr. G. Kelf), was awarded a Silver Knightian Med il for a collection of fruit, including two dozen Royal George Perches, and six bunches of Grapes, Black Hamburgh and Buckland Sweet-water. All of this fruit, and particularly the Peaches, was first rate, although it had been grown within two miles of Charing Cross.

Messrs, T. Rivers & Son, Siwbridgeworth, exhibited a white Hungurian Grape named Gradisk 1; and Mr. W. HANDYSIDES, 6s, Granger Street, Newcastle, showed a new Tomato.

were several Seedling Melons exhibited, but no

awards were made.

Messrs, W. Currush & Sons, Highgate, London, exhibited numerous fruits of two new Touritos: The Cropper, a fine rel fruit of the Pertection type, and a good cropper; and King of the Yellows, from a crop between Conference and B'enheim Orange,

Lecture on Cactaceous Plants.

A Lecture upon this subject was delivered in the after-NOTE THE HOLL THE SUSPECT OF THE COMMENCEMENT, who, at the commencement, briefly remarked upon the history of their culture in this country, and the difficulties connected with their importation until recently. It was stated that evidence of an awakened interest in this class of plants was found in the fact that he knew of two hundred and thirteen, more or less, enthusiastic collectors during list year. Anyone desirous of cultivating Cacti at the present time could obtain them most easily, either as established and acclimatized plants from certain of our own nurserymen, or by importation. The lecturer advised the former method as being the most satisfactory if practicable, and complained greatly of the insect pests with practicable, and complained greatly of the insect pests with which most of the plants are infested when they reach this country, which is explained, to a large extent, by the close packing to which the plants are subjected. A few remarks were made ament the bottny of the group, and to the nomenclature of the plants, also upon the extraordinary withity possessed by the seplants. Instances were given of pieces of specimens which had been the subjects of exceedingly bad usage, but which afterwards had become fine healthy plants. They could stant any temperature from 40° to 110° Fahr, but about 20° was most favourable to them to 140° Fahr., but about 90° was most favourable to them In regard to the best house for them, Mr. Chapman said

that the principal points for consideration were light, heat, and a dry atmosphere. Direct sunlight was beneficial and essential to most Cacti. Reference was then made to a nouse which is being tested at Chiswick; this house has an iron frame and no woodwork, the glass beiog fixed without putty, to stretched wires. It has a curved roof, and Mr. Chapman described it as being perfectly witertight and an ideal one

for Cactus culture.

There should be no stagnetion of moisture in the atmos-There should be no stagration or measure in constitu-phere, though, with plenty of ventilation, a little moisture might be even hencificial. Direct contact to the roots with reasure was falld, the plants required none. Small pots manure was falld, the plants required none. Small pots in the greenhouse exposed to full sunlight often became too hot and it was clvisable to shade them or plunge them

Soil was important. Fibrous loam should form the basis

and if a little sand and brick rubbish be added, the soil would he made porous and the plants root freely.

Propagation by me us of off-sets and cuttings was very easy in the case of almost all the species. The operation should be done at a suitable time, that they may in the roots before winter. Off-sets or cuttings should not be taken from plants that have been in this country less than twelve months.

The worst insect pest was the Mealy Bug. The best way to exterminate it, is to seek it out and remove it; afterwards to wash the plants with a very weak solution of paraflia.

Reference was also made a kind of blight, and the a ivice given that in cases of this the plants should be out down.

The chief source of supply was from the North American continent, and dealings with Mexico had been much simplified of late. Much of the technical part of the paper was reserved for publication in the Society's Journal.

In a discussion which occurred afterwards, Mr. Paracturant

referred to sufficient ventilation being an indispensable condition. They like I heat, but must not be baked. This gentleman pleaded that someone might translate foreign works upon Cacti, that they might be available to English

Mr. CANNELL of Swamley strongly recommended that the hot-water pipes necessary for the heating of a structure for these plants should be suspended close to the caves of the house. The system had worked most satisfactorily at Swanley

Mr CANNELL also state I that Mealy Bug could be killed

easily and safely by the use of the XL All vaporiser.

Mr. G. W. CUMMINS stated that he had seen the house the lecturer had referred to at Chiswick, and that the glass was broken owing to the method of glazing. He thought the house most unsuitable for eacticulture. Dr. Masters (Chuirman) referred to the "tough hide" and other structural adaptations of the control of the titions to resist undue evaporation. He had seen them cul-tivated to great advantage in cottage windows, and they flourished well in such a dense district as Limehouse. There were no more interesting plants than Caeti; and, none more gandy when in flower.

WATERFORD HORTICULTURAL.

Ji Lv 22. -The annual summer exhibition of this wellsupported society was held on the above dute in the Courthouse grounds. Witerford, an admirable place for a show of this kind, affording ample scope for the carrying out of the arrangements

The e-impetition that the various sections of the show displayed this year was acknowledged to be above the commonplace level, and the result cannot fail to add materially to the reputation of Waterford as a centre of horticultural operations second to none in Ireland The exhibits in every department reflected great credit on professional and amateur growers alike, and both in point of quantity and quality, exceeded the anticipations of the most experienced members of the society. The Begonias and Pelargoniums were especially of more than average merit.

Orchals were shown by W. G. D. Gott. Esq., Glenville (2r., Mr. Innes). This gentleman exhibited numerous other plants. His Orchids were novelties in that part of Ireland, and excited great interest.

The Marquis of Wyterform's exhibits were likewise many, and included a layer of bees at work. The Curraghanore Pelargoniums here off the 1st prize; and a tray of fruit (not for competition consisted of excellent produce. The Peas and Lettiness were well grown.

Double and displedlowered Begonias tuberous) and Car-

Double and an 26-dowered Begonias Indeponent and Carnations in variety came from Messrs, Sanners & Sons, Cork. Good Physics, Peaches, Melons, Leviathan Onions, Peas, &c., came from W. G. Pin, Esq., Summer Grove, Mount Mellick (gr., Mr. M. Hartley).

The fine Begonias of Messrs, R. Hartleyn & Son, Lough

The fine Begonias of Messrs, R. RURITAND & Sox, Longh Nurseries, Cork, were greatly admired. In this collection were included Dr. Nansen, M. Drony, and Malame Le Barrone St. Didler, &c. Begonias came from U. Jacon, Esq., Newtown (gr., Ur. W. Morrisy). W. Ruchardsox, Esq. (Mr. J., Stack, gr.) was successful with Maréchal Niel Rose, Cockscombs, Sweet Peas, double and single-flowered Pelargoniums, and Carter's special prize form collection of contribute.

for a collection of vegetables.

Lord Carew's stove plants were the admiration of all who

Lord Asherooke had well-bloomed Begonits.

ROYAL PERTHSHIRE HORTICULTURAL.

JULY 23 - This society held its first exhibition of this season in conjunction with the Highland and Agricultural Society, on the above date. The exhibits in every class were fairly numerous, and the quality was of high order

The tables of plants -foliage and flowering raised keen The tables of plints -foliage and flowering faised keen competition. The 1st prize, was, however, easily taken by Mr. Francis Neol, guidener to Tuos, Roy, Esq. The plants consisted for the greater part of Orchids. They all exhibited most successful culture. The species most conspicuous were Odontoglossum crispum, Miltonia vexillaria, of many shades of colour, and most floriferous; Cypripedium Curtisii, Oncidiums, Epidendrums, &c. They were set on a groundwork of Ferns—but we thought, as did many others, that their

beauty would have been much enhanced by the addition of a few similar foliaged plants as were seen in the 2nd and 3rd exhibits.

The specimen stove and greenhouse plants, though not of great size, were excellent; and the circular exhibits of fine great size, were excellent; and the circular exhibits of the foliage-plants and Ferns placed on the grass were most effective. Cut flowers of mostly every species were in great profusion, forming a capital exhibition of themselves.

Messrs. Porme & Co. of Rothesay exhibited largely of

their choicest stock—Sweat Peas, about fifty bunches, artistically arranged; Gladiolus in variety, Antirrhinams, Gailardias, Pianthus, Chrysanthemans, varieties of new Cactus Dahlias, remarkably distinct, were among the most attractive

Messrs, Storrie of Glenearse had a splendid display of herbaceous and other flowers, arranged for effect; so had Messrs. Cross of Dundee, whose exhibit was well interspersed with florists' flowers.

Mr. Cocker, Aberdeen, was well represented; but his great strength was in the Agricultural Show, where his cut flowers filled a tent, which was always crowded with a impring visitors.

Messrs Laird & Sinclair of Dundee were also leading exhibiters in the classes for cut flowers.

FRUIT

from under glass was not an extensive display, but there were some capital Peaches, Nectarines, Melous, and Grapes exhibited. Black Hamburgh Grapes were very fine. The best of these forfeited their position through being rubbed and disfigured. The Museats, though large in bunch, were unripe The Duke of Buceleuch Granes in several classes (exhibited by that successful cultivator, Mr. Leslie, Pitcullen, near Perth) were grand examples. A hunch of Appley Towers was in excellent form, the best example of this new Grape which we have seen, perfect for bloom, berries large and oval in form; the bunch was compact, and such as would be of special service for sending to a distance. Gooseberries, Currants in variety, Raspberries, Apples, many dishes for dessert and kitchen purposes, in some cases by their earliness seemed as if they had been cultivated under glass. These hardy fruits filled the whole side of a tent, and not an inferior dish was tabled.

THE VEGETABLES

form d of themselves a great exhibition. The collections form it of themselves a great exhibition. The collections were better than one usually sees. Potatos, Carrots, Pers, Cuembers, Tonatos, Celery, of great size and well blanched; Onions, Cabbages, Chaliff wers, and Furnips constituted the dishes in the collections. Mr. Flender, Cultoghey Gardens, was 1st; the 2nd prize collection was also excellent; indeed, every vegetable was good.

ROSES, &c.

The earliness of the season was in favour of most of the Roses were comparatively scarce. out of-doors produce. Messrs, Choll, of Dundee, had a capital exhibit of thirty-six blooms, which was awarded 1st prize; Mr. Cocker, Aberdeen Nursery, made an excellent 2nd-Horaco Vernet. Ulrich Brunner, Gustave Piganeau, A. K. Williams, White Lady, W. Brunner, Schateur Vaise, were shown in extra fine form—this old variety is still one of the most perfect in form.

In the Agricultural Show splendid stands of seeds, grasses,

ent flowers, roots, &c., attracted much attention, and were specialties of Mossrs. Webb, Stourbridge, Mr. Watt, Cupar, Fife, and DRUMMOND BROS., Edinburgh. Lord Balvair, the future heir to the princely domain of Scone Palace, presided at the judges' dinner, and spoke on practical Horticulture and its pleasure-giving influe ee to those who follow it, cottagers and amateurs in particular.

PLAISTOW AND UPTON PARK FLORICULTURAL.

July 23, 24.—One could searcely expect to see plants wellgrown at Plastow, for though it has some open spaces, remnints of market-gardens which could be found there a few years ago, yet there are enormous gasworks, chemical, and other manufactories that must be prejudicial to vegetation. And yet the very existence of the above society is a proof that something can be done, and we were somewhat astonished to fin I so many good examples of careful culture. The society is one formed by working men to induce others of their own order to take up the cultivation of plants, and there are chiering signs they are achieving this result, as the second exhibition, held on the above date in St. Mary's Parish-Hall, was a distinct advance upon the first.

Groups of plants were shown by amateurs, one to occupy a table space of 12 superficial feet. Here Mr. Earl, Eastern Royd, a machine-maker, was 1st with bright flowering and foliaged plants; and Mr. R. Corra, a tin-plate work, r. was 2nd. The best table group of 9 feet cum from Mr. White, Upton Park, a manufactorer's workman; Mr. M. Wheks, was 2nd. Still another group of 6 feet, and here Mr. Milleans was 1st; and Mr. Othernesteap 2nd. Mr. MILLBANK was 1st; and Mr. OLDBINDESTEAD 2nd. The principal plants forming these groups were Plumbago capensis, Fuchsits, zond and viriegated Pelargoniums, flowering Begonias of the tuberous type, also B. Weltoniensis, and some capital examples of the Rex section, Cannas, Nicotiana affinis, Lobelias, Antirchimums, Tradescantia, Glovinias, Hoya carnosa, Liliums, &c.; and of foliage plants, Isolepis, Figure elastica, Colous, Yuccus, Ferns, Selaginellus, &c., all grown in little glass houses, mainly of their own construction.

The best three flowering plants were tuberous Begonias

from Mr. Wilkins, Jr.; Mr. Boother came 2nd with two Begonias and a Petuuia. Foliage plants were mainly represented by Rex Begonias. The best specimen plant was a capital Lilium auratum from Mr. Markwork; Mr. Court winning 2nd with a good Campanula pyramidalis, both in

Of cut flowers Mr. Simmonus had six pretty bunches of hardy flowers grown in the open air; and a policeman by the name of IRELAND six dishes of very good vegetables gathered from an allotment. A Silver Medal was offered for twelve plants, three each of Fuchsias, Pelargoniums, Petunias, and Begonias, and was won by Mr. Simmonds.

There were professional classes, in which florist's and small

nurserymen competed, Messrs. Smith and Dyer being the leading prize-winners, and they staged very pretty groups; Mr. IRELAND had the best six plants, Mr. EARL the best three, and Mr. WERB the best single specimens.

HAMMERSMITH HORTICULTURAL.

July 24.—The twelfth annual show of this Society took place on the above date, and was by far the best it has yet held. Messrs, Charles Lee & Son sent from their Feltham brench a beautifully-arranged group of hardy ornamental foliage plants, in which the Cornuses figured effectively, constituting one of the features of the show.

Mr. James Gibson, gr. to E. H. Watts, Esq., Devonburst. Chiswick, sent, not for competition, a charming and wellarranged group of stove and greenhouse plants; as did also Mr. West, gr. to Mis. C. Brandon, Oakbrook, Ravenscourt Park; and Mr. Keys, The Nurseries, Shepherd's Bush. In the amateurs' section, Mr. Woodhouse gained premier

honours for a heautifully effective group of foliage and flowering plants; 2nd, Mr. BROMLEY.

Mr. James Hillier gained 1st prize for the best specimen plant in the show. Mr. John Addison, gr. to Mrs. LLOYD, Merton Lodge, Chiswick, sent some fine specimens of British Ferns, which gained the leading position.

Wild flowers, exhibited by school children, formed a pretty and extensive display.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

July 25.—The extraordinary season we have had has knocked all calculations "agley" as to the most suitable week for giving exhibitors a chance in bringing forward the very best of their Bose blooms. The display of Roses in Manchester was no doubt a very fine one, but if it had been only a week earlier it would have been much finer, and then the weather which has been so excellent in the North of England for the whole month of July would have drawn thousands together to look at them. As it happened, the day of the show was wet. Most of the great growers and exhibitors, both nurserymen and amateurs, were present, and one could see that most of the exhibits, which came from north, south, east, and west, had been suffering -some from a droughty atmosphere, others, such as the Irish Roses, from a plethera of moisture, rendering it exceedingly difficult to put up a lot to please each exhibitor.

The main competition between the nurserymen was with those from the Midlands, the Emerald Island, and Forfarshire, the pride of place for seventy-two single trusses going somewhat easily to Mr. II. MERRYWEATHER, Southwell, Notts; after painstaking deliberation and counting up of marks, the 2nd went to Messrs. A. Diekson & Son, Newtownards, end went to Messrs. A. Diekson & Son, Newtownards, co. Down, whose lot, upon the whole, was more even; and the 3rd to Messrs. D. & W. Croil. Dundee.

In Mr. Merryweather's stand were the fine deep crimson Duke of Edinburgh, the ruby-red E. Y. Teas, a glorious bloom,

with its fine shell-petuls of the bright crimson Salamander, Comtesse de Nadaillac, Merveille de Lyon, Sultan of Zanzibar, Edith Gifford, Alfred Colomb, Marchioness of Londonderry, Duke of Wellington, Denmark, Duke of Connaught, Germaine Gautier, the fine-formed palerose Baroness Rothschild. maine Gautter, the fine-tormed pute rose Baroness Rothselfill.
Charles Darwin, Earl of Dufforim—a charming Rose, Kaiserin
A. Victoria (white, lemon-shaded), Fisher Holmes, Duche s
of Bedford, A. K. Williams, Emilie Hausberg, Souvenir
de S. A. Prince, Sir Rowland Hill, Captain Christy, G.
Piganeau, Melle, Joseph Bennaire, a charming Rose, with
great shell petals of extra form, rose-shaded white, most
effective in a stand; Maurice Bernardin, Catherine Mermet effective in a stand ; Maurice Bernardin, Catherine Mermet, Captain Hayward, Heinrich Schultheiss, Suzanne-Marie Rodocanachi, The Bridesmaid, Star of Waltham, Souvenir Rodocanach, The Bridesmad, Star of Watthan, Souvenir d'Elise, pretty when in bud; Innocente Pirola, Abel Grand, Monsieur Verdier, Ulrich Brunner, large and full; Merie Verdier, the still first rank red Marie Baumann, Marchioness of Dufferin, Prince Arthur, François Michelon, grand hue of pure soft cerise; Marie Rady, John Stuart Mill, Charles Lefebyre, Mr. John Laing, a magnificent bloom; Etoile de Lyon, Ella Gordon, the soft blush Clio, a good, distinct Rose; Horace Vernet, Paul Neyron, with large-sized, pure soluted by the Mills of Delivery of the Reinford Mr. distinct Rose; Horace Vernet, Paul Neyvon, with large-sized, rosy-coloured bloom; Comte de Raimband, Ernest Metz, Jeannie Dickson, Madame Hosto, Dr. Andry, Countess of Oxford, and the equally full and rich-coloured Pierre Notting, the cupped white Etendard Jeanne d'Arc, Madame Verdier, Victor lingo, and several others. We give those names as showing some of the best old and some of the best new varieties; although they were chiefly in the premier

stand, they comprised most of the best flowers in other

The best new Rose in the show, and indeed the only one that was rewarded with a First-class Certificate, was one shown by the Newtownards firm and named Bessie Brown. It had been exhibited before—at Ulverston. It is a hybrid Tea, pure white in colour, with large well-formed petals, very much of the same outline of that famous Rose, Mrs. John Laing, and will bulk as largely.

For thirty-six, distinct, three trusses of each, 1st, Messrs. DICKSON & SONS, Newtownards; 2nd, Mr. H. MERRY-WEATHER; 3rd, Messrs. W. & D. CROLL. There were many good Roses in this group, but nothing looked finer or more commanding than Mrs. John Laing.

AMATEURS.

There was not so large a number of exhibitors from a distance among the competitors in these, as in the trade classes: still, there was sufficient distinction to point out that as much depends upon the grower as upon the exact geographical area in which he is situated. It was a battle really between Essex and the confines of Sherwood Forest, Rev. J. H. PEMBERTON holding his own among many combatants, as he has done, year after year.

This time Mr. H. V. MACHIN, Gateford Hall, Worksop, ran him hard, losing in the class for thirty-six, but winning in that for twelve blooms. This grower also showed well in the Teas and Noisettes, showing many clean well-grown flowers. The best in the big 1sts were Xavier Olibo, Ulrich Brunner, François Michelon, John Stuart Mill, Mdlle, Joseph Bennaire, Horace Vernet, and Alfred Colomb. went as follows:

For twenty-four distinct, single trusses lopen to residents within 20 miles of Manchester, Mr. Charles Bungess, Plumbley; and Mr. T. S. Jackson, Ashley, had stands of good average blooms, and they held position in most of the classes, followed by Mr. Jas. Brown, Heaton, Mersey.

Mr Goodacre, gr. to the Earl of Harrington, Derby, had the premier prize; Mr. JOSEPH WARD, Alfreton, was "ind for a collection of fruit, and also for the twelve best bunches of Grupes. The six bunches of Museat of Alexandria were large and shapely, but a little worting in colour. Mr. J. E. Platt, Cheadle, was 2nd with a good fresh lot, and Mr. Elehinstone had also a credit dde lot from Shipley Hall. Mr. McKill ar exhibited from Abney Hall a collection of

fruit comprising six bunches of Grapes, Lord Napier Nectarines, and Jefferson Plums,

HONORARY EXHIBITS.

There was a very large lot of miscellaneous cut border flowers, comprising several hundred bonque's of them in glasses in grand colour, but sadly wanting some greenery among them to reduce the stiff form dity. The white Asters were superb; the Carnations, Liliums, Stocks, Gaillardies, and Chrysauthemuns—in fact, every description of flower suitable for cutting for the daily market here FRANK Law, Sherington Farm, Sale.

Mesers, Suffer & Sons, Reading, but a grand assortment of Begonias, both single and double. The setting them in Maidenhair Ferns had a good effect

Messrs. Paul & Sons, Cheshunt, had a very good collection of cut Phloxes, the blue one taking the eye. They also showed Tea and Noisette Roses, and a select collection of cut flowers.

Mr. Septimus Pve, Garstang, "Pausy, Viola, and Carnation specialist," had a very large representative lot, justifying the title he hears. The Violas were ranged on a fiered trellis in single pyramids of bloom; and the Fancy Pansies were really a good well-cultivated lot—well shown, too.

Feeling allusion was made at the lunebeon to the death of

Mr. Bruce Findlay. Dean Holf, who was expected to have opened the show, sent his expressions of regret in suitable words; and the care of the gardens were deputed to two members of the Council-Ma Brown and Ma. Robinson, who were ably seconded by the lite Mr. Findlay's lieutemant, Mr. Charles Paul.

THE MIDLAND CARNATION AND PICOTEE.

JULY 24.—This followed close upon the heels of the exhibition of the London society, it was necessary it should be so, for the season of the bloom, owing to the great heat and dryness of the atmosphere, was compressed into a very few days. At Birmingham decidedly better quality prevailed than at the Crystal Palace. There were no flowers from the South, but to those numerously shown from the Midlands there could be added blooms from Lancashire and Yorkshire, and so a display of quality quite beyond what was auticipated took place. Entries were numerous, and there were but few absentees. As usual the exhibition took place in the show house of the Botanical Gardens, overhead being wreaths of Bougainvillea, Taesonia, Lapageria, &c., and considering the warm atmosphere of such a building, the flowers lasted remarkably well. Mr. ROBERT Sydenham, the Chairman and Treasurer, was again to the fore, taking some of the principal prizes, and becoming the holder for a year of the very handsome Challenge Cup given by the Society for a competition among trade growers. The companion cup given by the

Charles Turner Memorial Trustees for amateur growers brought a dead heat between Mr. Chas. F. Tourstan, a rising young grower of Wolverhumpton, and Mr. A. W. Jones, Handsworth, Birmingham: they being with 42 points each. It was suggested that each should hold the cup for six months out of the twelve.

CARNATIONS

There were eleven competitors with twelve Flake and bizarre Carnations, and it was remarked by the judges that the stands were astonishingly equal in point of merit, there the stands were astonishingly equal in point of merit, there not being a great deal to choose, between the first and the last; and this made the task of awarding seven prizes in each class a somewhat onerous one. Mr. R. Sydennay, Tenby Street, Birmingham, was placed 1st, having very good blooms of P. P. B. Arline, P. F. Gordon Lewis, S. B. Robert Lord, R. F. Mrs. Rowam, S. F. Guardsman, S. B. Edward Adams, P. P. B. Sarah Payne, P. P. B. W. Skirving, C. B. J. D. Hextall, P. F. George Melville, C. B. Master Fred and R. F. Rob Roy. 2nd, Mr. Tom Lour, florist, Todmorden, with C. B. Master Fred, P. P. B. Edith Annie, S. B. Admiral Curzon, C. B. Lord Salisbury, P. F. Magpie, C. B. Thaddeus, P. P. B. Arline, S. F. Sportsman, S. B. Robert Lord, R. F. Thalia, S. F. Guardsman, and C. B. J. S. Hedderly. Hedderle

There were eleven exhibitors of six varieties, and in this class the competition was also keen; Mr. Crossley Head, Hebden Bridges, taking the 1st prize.

PICOTEES.

There were eleven exhibitors of twelve white ground Picotees, and here again the competition was very close and exciting. g. Mr. R. Sydenham was again 1st, having H. Red Wilson, L. Rose E. Favourite, H. Ro. E. Little Phil. L. P. E. Pride of Leyton, L. P. E. Jessie, H. Ro E. Ludy Louisa, H. P. E. Muriel, H. Ro, E. Mrs. Payne, H. P. E. Amy Robsert, H. P. E. Mrs. Openshaw, L. Red E. Lena, and H. Red E. Ganymede. 2nd, Mr. J. Elwards, Florist, Manchester, with a dozen blooms which ran those of Mr. Sydenham very close indeed.

There were eleven exhibitors of six Picotees, Mr. CROSSLEY READ being again 1st with H. Red E. Brunette, L. Ro, E. Nellie, L. P. E. Thos. William, L. P. E. Esther, H. P. E. Zerlina, and H. Ro, E. Mrs. Payne; and Mr. C. F. Thurstan,

Wolverhampton, was 2nd Yellow Grounds and Fancies. These were finely shown, and there were nine entries for twelve dissimilar varieties, Mr. R. Sydenham again taking the 1st Prize with Romulus, Monarch, Yellowhammer, Cardmal Wolsey, Ladas, Nisbet Hall, The Dey, Mrs. Gooden, Janira, Mrs. R. Sydenham, Mrs. Douglas and Corisande; Mr. A. R. Brown, florist, Handsworth, was 2nd; Messrs, Thomson & Co., nurserymen, Sparkhill, Birmingham, were 3rd.

There were nine exhibitors of six varieties. Mr. C. F. Tuurstan was 1st with excellent blooms of George Cruikshauk, The Dey, Yellowhammer, Ladas, Mrs. Douglas, and Mrs. R. Sydenham; 2nd, Mr. A. W. Jones.

The next class was for true Yellow-ground Picotees, the

The next class was for true Yenow-ground Frequest, the laked and fancy varieties excluded; Mr. A. W. Jorns being plued 1st, with Ludas, Countess of Jersey, Mrs. R. Syden ham, Mrs. Douglas, Mrs. Gooden, and Mrs. Whithourn; Mr. R. Sydenham was a close 2nd with the same varieties, excepting Mrs. Whitbourn, he staging Mrs. Dranfield. Mr. Sydens-nym is to be commended for instituting this class, as it is high time the true Yellow Prestees should be formed into a class by themselves.

> () Carnations. There was a very keen competition with twelve self Carnations, Mr. W. KENNOR coming 1st, with Mancunian, a very fine maroon-crimson Self: R. Bealey, a lurge purple-crimson sport, from the P. P. B. R. Bealey, a lurge purple-crimson sport, from the F. P. B. R. Bealey; a lurge purple-crimson sport, from the F. P. B. R. Bealey; a lurge purple-crimson sport, from the P. P. B. R. Bealey; a lurge purple-crimson sport, from the P. P. B. R. Bealey; a lurge purple-crimson sport, from the P. P. B. R. Bealey; a lurge purple-crimson sport, from the P. P. Bealey; a lurge purple crimson sport, from the P. P. Bealey; a lurge purple crimson sport, from the P. P. Bealey; a lurge purple crimson sport, from the P. P. Bealey; a lurge purple crimson sport, from the P. P. Bealey; a lurge purple crimson sport, from the P. P. Bealey; a lurge purple-crimson sport, from the P. P.

There were ten exhibitors of Six Selfs, Mr. C, F. THUESFAN taking the 1st prize, with c pital blooms of Germania, Bridesmaid, Alsemonde rose Self), Mrs. Eric Hambro, Hebe and Maneuman. 2nd Mr. J. Brookellurest, Moston, Manchester. In a few classes, blooms of the several types of the Carnation were shown, each with a spray of foliage and set up

in glasses. As a rule none of the varieties were named, and as in London so at Birmingham, the flowers so shown did not rise much above the level of button hole flowers sold in the streets; had the strict letter of the schedule been adhered to most of the collections would have been disqualified,

Single blooms of the various classes were produced in considerable numbers. Carnations were numerous, and of S. Bs., Robert Houlgrave and Robert Lord took the leading prizes; of C. Bs., J. S. Hedderley, Lord Salisbury and Edward Rowan; of P. P. Bs., William Skirving took all the prizes; and of S. Fs., Sportsman; R. Fs., Mrs. Rowan and Mrs. May; P. Fs., Gordon Lewis and James Douglas.

Picotecs.—H. Red E.: Mr. John Sunthand had Brunette, 1

Ref E. Thomas William and Mrs. Gorton, H. P. E. Polly Brazil and Muriel, L. P. E. Pride of Leyton, Ann Lord and Clara Penson, H. Rose E. Lady Louisa and Mrs. Payne, L. Rose E. Favourite, H. Searlet E. Mrs. Sharp, one of the brightest edged flowers in cultivation

8 lfs — White, Mrs. Eric Hambro and Mr. Lee; yellow or 8/fs — White, Mrs. Eric Hambro and Mr. Lee; yellow or buft, Germania, nothing can beat it; pink rose or searlet, William Bean (Sport) and Ruby; dark crimson or maroon, Manxman, a very fine northern flower, and Mephisto The best yellow ground Prootee was Mrs. R. Sydenham, it took the three leading prizes; the best Fancy was a run form of the S. B. Othello, Romalus and President Carnot. Promer Blooms.—The best bizarie was S. B. Gilbert, a rich selected part perigraphy.

coloured new variety from Mr. J. EDWARDS; he had also the

Predict rose flake in Mrs. Rowan; the premier heavy edged Preotec in P. E. Mrs. Edwards; and the premier light edged in Rev. E. Thomas Williams; the premier yellow ground Mrs. R. Sydenham from Mr. R. Sydenham; the premier self, Mrs. Eric Ham'ro, white, from Mr. A. R. Brown; the the premier fancy Monarch, also from Mr. R. Sydenham.

Broker Carnations shows in hands a with

Brider Carnottons shown in bunches with long stems were a good feature, five stems forming a bunch. The best twelve came from Messis Rogers & Son, Whittlesea, Peterborough; Messis Thomson & Co. being 2nd, and Mr. J. Walker, 3rd, The best Camation from Mr. C. F. Therstan; the Rev. C. P. Brin kwell, Broadway, was 2nd; and Mr. Goo, Chivinov. Oxford, 3rd. With twelve bunches of Fancies and Selfs, Messis Rogers & Son were again 1st, Messis. Thomson & Co., 2nd. With six bunches, Mr. Geo, Chaundy was 1st, and the Rev. M. Brin kwell, 2nd, but none of the varieties were named, though there is a rule requiring they should be so.

Pols of Carnations represented by well-grown and bloomed specimens were shown in sixes; Mr. R. Sytoxia in was 1st, and Messrs. Thousen & Co., 2nd. Mr. R. Syfoxia in was 1st, the only exhibitor for Mr. Eenest Benary's special prize for six warieties raised in Erfurt, he having admirably-grown and designed chartes.

and flowered plants.

The Silver Medial of the Botanical Society was awarded to Mr. R. Sadenian, and the Bronze Medial to Mr. T. Loro, they having gained the greatest number of prizes in certain classes. In other classes the Silver Medial went to Messis, Rockes & Sox, and the Bronze Medial to the Rev. Mr. Bronswill.

Certificates of Merit were awarded to Yellow Self Caunations Lord Wantage, pure, and finely formed, from Mr T E. HENWOOD, Reading; and to the following new varieties of Sweet Peas from Mr. HENRY FORE 666, viz., Ludy Nina Balfour, Salopian, and Prince Edward of York.

Obituary.

MR. JOHN EWING. - Many habitue's of the Sheffield Botanical Gardens in the old days [and doubtless numerous readers of this journal, Etc.] will hear with regret of the death, on July 23, of Mr. John Ewing, a gentleman who for more than thirty years occupied the responsible post of Curator there. Mr. Ewing was a native of Fife. He was well known among the leading horticulturists and nurserymen of the country, and in his later days loved to talk of the great people with whom he was acquainted. When the late Emperor of Brazil visited Sheffield, ho called upon Mr. Ewing at 6 o'clock in the morn ing, and the two paraded the pleasant grounds, discoursing botanical subjects. Mr. Ewing died from sheer old age, after a life well spent. A few years ago he retired, with the promise of a pension from the authorities at the Botanical Gardens. It was, unfor tunately, discovered after his retirement that the payment of the pension-money was illegal, and this somewhat embittered the good old man's last days. He became, however, a few mouths ago, a pensioner of the Royal Gardeners' Benevolent Institution. The deceased, who was eighty three years old, leaves a simand two daughters. Shopfield Daily Independ ut, July 24, 1896.

PROFESSOR KANITZ. — We regret to have to announce the death of M Auguste Kanitz, the Professor of Botany and Director of the Botanic Carden at Kolosvir (Klausenberg).—Prof. Kunitz was in his fifty-fifth year.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gurdener, Woodside, Dorlington.

CYCLAMEN PERSICUM VAR. GRANDIFLORUM.—To have these pretty plants in the best condition, the following method of culture should be adopted. The seed should be sown forthwith, care being taken to procure seeds of a good strain. Prepare some thoroughly clean, shallow, carthenware pans, draming them with clean crocks, and filling them with a compost consisting of boan and leaf mould in equal parts, and a liberal amount of clean sharp stud all well mixed together and made firm, and afterwards watered and allowed to stand aside for an hour or two. In sowing, place one seed on each square inch of surface, cover to the depth of \(\frac{1}{2} \) inch with finely sifted sod; allord water lightly with a fine rose water-pot, and when the surface is dry, place a sheet of thick brown paper over each pan, and stand in a house or pit having a warmth of 60, well shading the pans from the sun. By keeping the surface of the

paper moist, it is not usually found to be necessary to water the soil in the pans before germination has taken place; still, in hot dry weather it is prudent to examine the seed-pans occasionally to ascertain if the direct application of water is required, for on no account should the soil lack moisture. Plants raised from seed which was sown in the autumn of last year, if their cultivation has been of the proper kind, should now receive their last re-potting, the compost used being that which I have recommended for the seedpans, only in a rougher condition; merely adding a small quantity of an artificial fertiliser. plants near the glass, we'll shading them from bright sunshine, for at no time whilst in growth can the Cyclamen stand exposure to bright sunshine. For a month after re-potting, the plants should be dewed overhead at least twice a day, after that length o time overhead dumping must be discontinued, and the plants carefully watered, taking care that the tubers are not even wetted on the top, or the dampingoff of the flower stalks may result.

BALSAMS. - These brautiful plants, if raised from early-sown seed, and their cultivation has been carried on in a brisk bottom-heat (80°), afforded by stable-manure and tree-leaves, may now be re-potted for the last time. If the plants are intended for greenhouse, conservatory, or house decoration, pots of 6 or 7 inches in diameter are sufficiently large, manurial aids to growth being better than the use of very large pots. The soil used should be rich, and consist of one part of dried cow-dung, one of leaf-mould, one of loam, and one of sharp sand if the loam betenacious. When re-potted, plunge the plants up to the rim of the pot in a partly spent hothed. If large well branched plants are required, 10 to 11 inch pots may be used. Although Balsams are gross feedng plants, do not begin to afford them manure water before the soil is filled with roo's. Damp the plants overhead morning and evening, attend to the thinning of the side shoots, and remove the bloom buds entirely till the plant has arrived at the required size, or nearly so.

CROTONS Sunshine and a free circulation of air are the cluef factors in getting Crotons to colour well. The Crotons struck from cuttings in the spiring should now be allouded their last reporting for the season, which may consist of 5 or 6 inch pots. Such plants will, in the course of two months, make very suitable plants late in the autumn and early winter for a variety of purposes. Pot-bound Crotons will require monure water to encourage growth, and for this purpose the drainage of the cow shed is excellent; and where this cannot be obtained, Thomson's, Clay's, Becson's, and Goulding's are all good if used according to the directions given with them.

THE ORCHID HOUSES.

By W. H. White, Orchid Grower, Burford, Durking

LESS SHOWY ORCHIDS .- Owing to a desire for large and showy Orchids, a great number of the smaller-growing species have been neglected. No description e in give an idequate idea of the quant distinctiveness of many of these or of their varied charms, which in a representative collection are present in more or less degree throughout the year these may be mentioned Bulbophyllum barbigerum, B. comosum, B. mandibulare, B. Lobbi, B. Eriessoni, B. pateus, B. Dearei, B. grandiflorum, B. umbellatum, B. longisepalum, B. Sillemianum, and B. auricomum, Currhopetalum Medusa, C. Cumingi, C. ornatissimum, C. Rothschildiamum, C. robustum, C. Thonarsi, C. picturatum, C. Macraei, C. O'Brieniamum, C. Colletti, and many others. Their culture is not particularly difficult. Many of them having long creeping rhizomes, and being vigorous in habit, should be planted in Terk wood baskets of sufficient size. For the smaller growing varieties shallow pans are in every way suitable. The baskets or pans used should be filled to three-fourths of their depth with clein crocks, and a layer of sphagnum moss placed above Upon this place the plants, and carefully spread out the roots over the surface of the moss, then fill up to the thizome with onlinary Orchid compost, mixing a moderate quantity of small crocks with it. After repotting, and until the roots and growths have fairly started, only a very slight sprinkling of water on the compost is necessary; but when re-established, and in full growth, they require an almost infimited supply of water at the root. The proper time to re-pot Bulbophyllums, Circhopetalums, Sarcopodiums, and Megaelmiums, is just when now growth commences. All of them should be suspended close to the roof-glass on the shady side of the East Indian house, or warm plant.

stove. Insect-pests rarely trouble them, but an occasional sponging of the leaves is conducive to healthy growth. The rare Cucliopsis hyacinthosma may be grown under similar conditions, and in shallow baskets, but no crocks need be used for drainage, as the flower-spikes always push out through the bottom of the basket. Acineta Barkeri, A. densa, A. Humboldti, A. chrysantha, Stanbopea Wardi, S. insignis, S. tigrina, S. eburnea, S. Ruckeriana, &c., a'so Luddemannia Lehmanni, and L. triloba have all similar characteristics in their babit of flowering. therefore basket culture is the most suitable for them. The correct temperature for these species is that of the intermediate-house. Abundance of water is essential during the growing season, and it is well to periodically sponge the under-surface of the leaves to prevent the attacks of red-spider, to which Stanhopeas, Acinetas, and Luddemannias are subject. Arpophyllum giganteum and A. spicatum, when strongly grown and well bloomed, make handsome specimens. Both species thrive in well-drained pots in a mixture of peat and sphagnum. Stand them in a light position in the intermediate-house, and afford plenty of water at all times. Epidendrum prismatocarpum, E. variegatum, E. fragrans, E. brassavoke and E. Stamfordianum, having finished flowering, are now commencing to grow afresh, and any that need to be repotted may now be taken in hand. Afford plenty of drainage, and elevate the base of the plants a trifle above the rim of the pot; and use a compost consisting of two parts of rough libry peat to one of sphagnum-moss. Place them in a light moist position in the intermediate-house, and afford water carefully until well rooted, neither letting them become very dry nor too moist,

COOL-HOUSES. - Such Orchids as Oneidium Phakenopsis, O. nubigenum, O. eucullatum, O. olivaceum Lawrenceanum, O. dasytyle, O. cristatum, O. virgulatum, and O. St. Legerianum will now require fresh material to root in. The first four named species succeed best in pots stood upon the ordinary stage, and in the coolest and shadiest position available. The other species prefer shallow pans suspended from close up to the roof glass of the house. All of them should be plentifully supplied with water during the season of growth. The pretty Cochlinda Noetzliana should also be repotted now that it is starting to grow, During summer the cool-house is the best place for it; but in winter, when the weather is severe, the intermediate house is better. Keep this house as cool as possible, and, if necessary, shade a trifle heavier than usud during brilliant subshine, and syringe the shading several times during the day; also the intermediate external surroundings may be kept moist by the same means; and only afford water at the root when it is necessary.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

PEACH AND NECTARINE TREES —All the young wood should be secured, keeping it straight and neatly trained between the old shoots and branches, being eareful that they do not unduly shade or interfere with the development of the fruit. In doing this be careful to remove wall nails and studs which may injure any of the fruits; remove the leaves that overhaug the latter, so that they may receive full exposure to sunshine, in the absence of which the high colour characteristic of most varieties of Peaches and Nectarines never fully developes. Syringe the trees daily till the fruit begins to change colour, then discontinue it entirely till the crop is taken, a mulch is spread on the border, and trees have a daily syringing, the surface-soil will generally show a sufficiently moist appearance, but these indications are deceptive as to the state of the soil as regards moisture at 6 inches deep; the prudent gardener will therefore examine the bord is to their full depth, and afford water as it may seem to be needed. Some fresh manure should be placed on the borders if the old mulch has in great part disappeared.

CHERRIES. The nets should be removed from all trees whence the crop is taken, and placed over the Morello Cherry trees. The secondary growths of sweet varieties may be shortened back to a leaf, and macet pests destroyed with tobacco-water, &c, and the trees washed with clean water early in the afternoon in sunny weather. The borders in most gardens will require to be thoroughly saturated with water.

APPLES AND PEARS.—The early varieties will now require special attention as regards gathering the fruit, for if these are gathered only a few days before they are ready, flavour will be conspicuous by its absence, and if they are left on the trees too long they begone meetly. It is a good practice to go over

the trees daily, taking off a few at a time as they become fit.

VINES.—Lay in, and make secure the young rods of Vines which were left for extending the Vine or taking the place of old branches; remove the weaker laterals where there are too many, securing to the wall those that are retained; also remove the smaller and worst-placed bunches if the crop is too heavy for the Vine to properly finish off.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

HERBACEOUS BORDERS.—These borders will require frequent attention in order to prevent overcrowding, which may be partly obviated by the removal of all useless growths, and these are, in eensequence of the drought, very numerous in some kinds of soil. Tall-growing plants should be made secure against wind by means of strong stakes, one, two, or three, as may seem desirable being given to each plant. Asters, Stocks, and other annuals, made use of in filling up vacant spaces in the border, should not be allowed to lack moisture, but this should be frequently applied till such time as a good fall of rain takes place.

GENERAL WORK.—Foliage-plants will need to be cut back where the beds in which they are growing form part of a geometrical garden. The decaying flowers on shrulby Calceolarias should be kept picked off the plants, and the latter kept in as vigorous a condition as possible, thus favouring their flowering, and the production of shoots fit for making cuttings at a later part of the year. Mowing will require careful doing until the turf regains its freshness, it having become much browned by the drought. In many gardens there is really no grass to cut. In places where the gardener is enabled to water the lawns, this work should not be suspended before we get abundant rains. Gravel walks made of binding materials, the surface of which may have become loose, should be watered also where the means allow it to be done, afterwards giving them a good rolling; otherwise, beyond the rolling giving a tidier appearance, little good is done. Nothing adds so much to the well-kept appearance of a place as smooth, clean walks, neatly trimmed at the edges.

PROPAGATION OF SUMMER BEDDING PLANTS will soou engage the attention of the flower-gardener who makes much use of the tenderer kinds of plants in filling his flower-beds. In order that as little delay as possible should occur when the work is begun, various mixtures of soils should be got in readiness, flower-pots, pans, and boxes cleaned and crocked, and the frames or pits in which the cuttings are to be placed should be cleaued, and the bottom surfaced with clean gravel or fine coal ashes.

EARLY-FLOWERING CHRYSANTHEMUMS.—These useful and pretty plants are now growing rapidly, and in some instances the flower-buds are expanding, looking well on the whole in spite of the drought. It would, however, be well to afford them farmyard liquid-manure, or some kind of artificial manure, particularly the plants growing in shrubbery borders, the soil in such places being rendered very dry by the roots of the shrubs, &c. Madame Desgranges still holds its own as one of the most useful Chrysanthemums for flowering outside; others worthy of cultivation being La Vierge, Prococité, Mrs. Hawkins, and Mrs. Cullingford.

GYPSOPHILA PANICULATA, now in the height of flower, is one of the most useful of our hardy plants, its graceful sprays of blossoms make, when placed in flower-glasses or vases along with Sweet Peas, Coreopsis lanceolata, Iceland Poppies, and Fern fronds, a very pretty combination. This plant is propagated by seed or divisiou of the roots. Seeds should be sown as soon as ripe on a spent hotbed, the mouth of June being the most suitable period. [G. cerasticides seeds may be sown in the same manner from the beginning of May to the end of June, the plants making capital groundwork or edgings. G. elegans should be sown in the open ground where it is intended to flower, and it is a most abundant bloomer: this species and G. muralis should be sown on a spent hotbed, or in pots in the greenhouse in the month of May. The last two are annuals. Ed. Division of peremnal species should be carried out when the plants are on the move.

STATICE LATIFOLIA (Great Sea Lavender) and its kindred varieties are amongst some of our best autumn-flowering perennials, and their value for decorative purposes in the fresh and in the dried

state are not sufficiently known. The plants are of easy cultivation, thriving in almost any kind of soil or position, and they should therefore find a place in every garden, however small. The annual varieties are very useful, although not so much so as S. latifolia.

THE KITCHEN GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

ONIONS.-Although the time has now arrived when sowings of Onions to stand through the winter should be made, the preparation of the seed-beds will entail much labour if the drought continues. In the event of rain not falling in quantity before this appears in print, it may be advisable to defer sowing for a short time, as with the present warmth in the soil, should rain ensue, the growth would be rapid. Planting and sowing of every description has hitherto been carried on with difficulty, and with a change in the weather much of this kind of work which has had to wait will require to be finished up quickly. If the plot intended to be sown with winter Onions carried a crop of Peas or Cauliflowers, it should be dressed with rotten manure, and then dug. thoroughly incorporating the manure with the soil, and immediately afterwards trampling it over, so as to confine the small amount of moisture present in On preserving moisture, and the ammonia of the manure, much of the well-being of the future crop will depend, and this is most effectually done by compacting the soil. After affording a dressing of soot and burnt garden-refuse to the dug ground, rake it over, and treat generally in the manner recommended for spring sowings. If the seeds are sown before rainfall, the drills, which should be drawn fully 1 inch deep and 12 inches apart, must be copiously watered before and after the seeds are put into the ground, covering them with soil, with the back of a rake. By doing the work in this manner, the moist soil may be made to rest upon the seeds, and that which is dry, if raked over the surface afterwards, will then act as a mulch, and prevent the rapid escape of moisture from the land. Although any variety of Onion may be sown at this season, there are some which are generally recognised as being more suitable than others. The early white Naples Tripoli is quick to form useable bulbs, but the seeds should not be sown in quantity, as the bulbs are not good keepers: the Giant Rocca, Globe Tripoli, Brown Globe, and James' Keeping are better. What remains in the ground of the Onion crop of last autumn may now be pulled up, dried in the open air, and then stored away thinly in some cool shed,

SPRING-SOWN ONIONS.—These, if not mulched with short manure, should be kept well stirred, as the frequent waterings afforded the land will have caused it to cake, and where they have not had water applied during the drought they will be very small.

OUT-DOOR TOMATOS.—These, with us, have set well, and many of the plants have three or more good bunches of fruits which are swelling fast. A mulch of rotten manure should be put over the roots, and a copious watering afforded as often as may be necessary, with liquid or artificial manure occasionally. The plants should have all side growths removed twice a week, the stem being secured in an upright position. If the laterals are pinched out as soon as observed, there will be little need for the removal of the chief leaves, at least, for a time.

VARIOUS.—Marrows and Ridge Cucumbers should be well supplied with water, and the fruits removed as soou as large enough for use, otherwise growth will be much restricted, and the flowers fail to set. Disused hotbeds may have Vegetable Marrow seeds dibbled into them, the plants thus raised, in a favourable autumn, producing a useful crop of late Marrows. Seedlings of common Thyme, Marjoram, and such like, should be thinned, vacancies in the herb borders made good; and with a change to dull or wet weather, slips of Sage, if dibbled in, will strike freely.

FRUITS UNDER GLASS.

By W. Pope, Gardener, $High_{i}$ -tere Castle, Newbury.

STRAWBERRY-PLANTS FOR EARLY FORCING.— There should now be no delay in getting the rooted runners potted in the pots in which they are intended to fruit, it being of primary importance that all which will be forced early in the new year should fill the pots with roots, and mature the crowns in good time, and in that way assure the plants a senson of rest before starting to force them. When potted, standthem on a firm and level bed of coal-ashes: and, failing this, they may be stood upon boards or trelliswork, being careful, wherever they are placed, to avoid crowding them, so that air and sunlight may have full play on all sides. Afford water plentifully when the soil fills with roots, and weak liquid-manure two or three times a week. All runners which form should be taken off weekly, and the soil kept free from weeds. If the required number of runners for general forcing have not been layered, they should be secured forthwith.

THE PINERY. - Succession plants now in rapid growth require liberal yet careful ventilation, prevent their leaves becoming drawn; and if, owing to insufficient space being available at pottingtime, they were closely crowded together, a rearrangement should now be made, and more space afforded each plant. Examine the stock plants on alternate days, and when water is afforded, let it be without stint, so as to moisten the ball of soil throughout. Plants which will fruit early in 1897 should be grown on without any check from over-dryness being given, which might result in premature fruiting. Lightly syringe them every afternoon on fine days, doing it very lightly over the foliage, as to have water constantly standing in the axils of the leaves is very undesirable. During the late tropical weather fire-heat has been altogether dispensed with here, but it will be turned on as required if the weather alter to dull and rainy. The degree of warmth at night should range from 65 to 70° for successions, and 70° to 75 for fruiters, with a 10 increase by day. Maintain humidity about the plants which have swelling fruits, syringing the paths, and surface of the bed twice a day, and slightly dewing the plants after a bright day without wetting the crowns. Plants with ripening fruit must not be allowed to get over-dry at ripening fruit must not be anowed to get over-my at this season, but sufficient water should be supplied to keep the soil nicely moist. Should more fruits appear to be ripening than are likely to be required at one time, some of the less forward ones—that is, before becoming fully coloured-may be retarded by placing them in a well-ventilated vinery; and even quite ripe fruit may be kept in good condition for some time by taking the plants with the fruits thereon to a cool, dry fruit-room.

THE APIARY.

By Expert.

DRIVING BEES: INCREASING STOCKS .- At this time of year stocks may be increased very cheaply by means of driven bees, which can often be obtained from people who do not care, or who are afraid of taking own honey, and are willing to give the bees away for the sake of having the honey taken from To commence driving bees, first see that you should consist of a straw skep, two driving irons, and a skewer smoker filled with brown-paper, old cotton-waste, or old cloth—in fact, anything that will burn well, earbolic cloth, and a few goose or turkey feathers tied together to form a small brush. The driving-irons are easily made by taking two pieces of thin round iron, 8 or inches in length, and bent down at each end about 1 inch to a sharp 1 oint, to allow it to enter the straw skep easily. The carbolic-cloth must not be made too wet; the best way is to sprinkle the cloths with a small tin pepper-box containing a solution of one part carbolic (Calvert's No. 5), and one of warm water, which is better than cold, as it allows the carbolic to mix better. After you are pre-pared with the needful articles, give the bees pared with the needful articles, give the bees a little smoke in the entrance of the hive, which causes them to fill themselves with honey, and so to a certain extent subdues them; then loosen the skep on each side gently, which will always be found scaled down with propolis. Take the earbolic cloth in both hands, gradually raise the skep; in doing so allow the cloth to fall over the bottom of it; see it is brought well over to prevent any bees from getting out; carry a little way off, and stand on a bucket, box, or anything that will make a firm standing: remove a little portion of the cloth, to see that the combs run (this is important, otherwise they will have to travel across the combs, and round the skep) into the empty skep, which you secure down to the full one firmly, and then attack the sides with the irons; commence tapping each side gently, and the bees will run up very easily. In eases where the combs are soft, which is the case with swarms, great care should be exercised or the combs and bees will be all mixed up together. As soon as the hive has been removed, place an empty skep on the same stand to catch all the

flying bees, which you can secure afterwards; by doing this you not only save the bees, but they have something to do, instead of buzzing round you, when you are driving. In driving bees they will often go to the back of the skep: to prevent this, have a second cloth placed round it at the back; this will cause them to go up into the empty one above. In carrying bees away, always carry them with the mouth of the skep upwards, and feed as soon as you get them home.

ROBBING. Having collected all the honey that is to be had, bees will attack weak stocks; and to prevent this, close up the entrances of all hives to about I inch. This will enable them to protect themselves better, otherwise a colony will be robbed of all their stores and perish.

LOUIS SCIPIO COCHET.

THE famous Freuch rosarian, whose death we briefly noticed in our issue for June 20, deserves to have a fuller notice than we were then enabled to give our readers. Cochet was a man of extraordinary strength of character, who gained for himself numerous friends; and at his funeral at Grisy-Suisnes, one may say, that all the inhabitants of Grisy and Suisnes were present, besides namy members of the Societé Nationale d'Horticulture de France. The important business at Suisnes which he guided with a firm hand, and of which many envied him the possession, was raised from very modest beginnings. It was founded by Christopher Cochet, with the assistance of Admiral, Comte Bougainville, in the year 1799, Cochet being the Comte's gardener. He commenced with the cultivation of Roses in the open air, and brought them to such a state of perfection and development that to this day the entire locality of Brie-Comte-Robert, situated in a charming part of the Seine-et-Marne department, bears the name of the "Pays des Roses."

The possession of the nursery business at Suisnes descended from father to son in the family Cochet, and in 1853 Scipio Cochet, in company with his brother Philemon, began to exhibit great energy in the conduct of the nursery, bringing it up to requirements of the day. In 1860, S. Cochet became sole proprietor of the business in which he had been only partner, and in 1877, in company with Camillo Bernardin, he founded the Journal des Roses, a monthly periodical almost entirely devoted to Roses. The direction of affairs is now undertaken by Pierre Cochet, son of the deceased.

Among the many fine Roses raised by the late L. S. Cochet, we may mention just a few that maintain a leading place in collections in this country: Souvenir de la Reine d'Augleterre, Mille. Elise Chabrier, Chas. Lee, Baron Girardot, Madame Scipio Cochet, Madame Bonin, Madame Pierre Cochet, Manna Cochet, Grand Due Pierre de Russie, Mille. Marie Perrin, La Nantaise, and Baron G. de Noirmont. A truly goodly list, and sufficient to keep the name of L. S. Cochet in the grateful remembrance of lovers of Roses for a hundred years at the least.

FOREIGN CORRESPONDENCE.

THE EFFECT OF SOIL ON PALMS.

Here, in the Riviera, where Palms attain to gigantic dimensions in the open ground, it is interesting to note the effect that the soil has upon their development, as the following will show. We have here three distinct kinds of soil, sometimes confined to districts, or in some cases to be found in very limited areas. The three generally met with are—1, granitic; 2, argillaceous; and, 3, calcareous. Other kinds exist, but are generally found in narrow veins, the formation of which may be attributed to the action of glaciers, of which there are many proofs of their existence in bygone ages.

In the grante soil the majority of Palms thrive well, but owing to its porous nature, the trunk and petioles of the leaves become clougated, and the old leaves return their vitality a much shorter time than when growing in a stiffer soil.

In the argillaceous soil there is a marked difference; the trunks have a tendency to increase in bulk (diameter), the Palms are much dwarfer, and the leaves retain their vitality much longer. In this soil the Cocos, in most instances, refuses to grow for any length of time, and it is evident, with the exception of Phenix, that this soil is the worst kind for the generality of Palms.

The calcareous soil is decidedly the most suitable to the generality of Palms (nuless of too stiff a nature), as may be noted by their thorough development and the deep green tint of their foliage. Aspect, depth of soil, and nature of subsoil have to be taken into consideration; but the latter, which invariably consists of hard impenetrable rock, is of little or no importance. Peat soil, which is sometimes employed in gardens here, is too expensive for experimenting with, but 1 have had occasion to note that Cocos flexnosa will not thrive in it.

With regard to large specimens, it is evident that a good porous loam; is the nearest approach to their requirements.

ERIGERON MUURONATUM (VITTADINIA TRILORA).

As far as I can ascertain, this plant is as yet little known in English gardens [/], but owing to its easy culture and free-flowering habit it ought to prove a valuable addition to the flower-garden.

It mostly resembles a Liliput Daisy, and the flowers open nearly white and shade away to deep red, thus there are often several shades of colour on the same plant. It strikes freely from cuttings, and should prove a valuable plant for mixing with other colours for summer bedding. It withstands the drought, and might also be employed with effect in the rockgarden. In the Riviera gardens it is chiefly employed in the rockery associated with succulent plants, where it gets but very little moisture during the summer months.

A Hybrid Serapias.

Amongst the terrestrial Orchids of the Maritime Alps it is rare to find a natural hybrid, but whilst botanising a short time ago at St. Cesaire, about twelve miles from Grasse, $\overline{\mathbf{l}}$ had the good fortune to discover one which has, I believe, not been found before. Allioni in his Flore des Alpes Maritimes describes two, under the names of Scrapius triloba, and Isias triloba. One was found at Berre in 1866, and is a supposed hybrid between Scrapias lingua and Orchis papiliouacea, and the other at Dimo. near D'Onielle, in 1843-1862, growing with Serapias longipetala and Orchis laxiflora, which are probably the parents. The one in question was growing with Serapias longipetala and Orchis globosa, and is undoubtedly a hybrid between these two. The sepals and petals are chocolate coloured, the dorsal sepal oval in shape, with the edges slightly curving inwards, and the lip trilobed, white, with purple lines and

It is rather singular that considering the quantity of seed which one capsule will produce that in each case only one plant could be found, although I searched the spot thoroughly. Riviera.

A DOUBLE FLOWERED RHODODENDRON HUSBITCH.

List year a gentleman found in the neighbourhood of this much frequented place some bunches of a very double Rhododeudron hirsutum. I mentioned this to the inspector of the botanic garden at Insbruck, and was teld by him of the following, I think very interesting occurrence. The former inspector of these gardens found in the Ortler district a Rhododendron ferrugineum with double flowers. He examined these flowers very earefully, and discovered a very small, nearly microscopic insect in the flower heads. He concluded that this insect bites away the pistils in an embryo state, so that the latter developed into flower leaves. To ascertain the correctness of his opinion, he threw some of the Rhododendron blooms into a copse of Saponaria ocymoides, and visiting next year the place, was much pleased to find a large number of the Saponarias very double. Could this experience not be made use of in horticulture! O. F., Lebenhof. [The production of double flowers in consequence of the attacks of mites was asserted by the late Prof. Peyritsch ED.]

BELGIUM.

BRUSSELS INTERNATIONAL EXHIBITION IN 1897.

DURING this exhibition there will be held a permanent horticultural exhibition from May to November, including classes for groups and single specimens of trees and shrubs, Roses, herbaceous, sub-ligneous plants, annuals, decorative plants for the greenhouse, &c.

There are to be four temporary exhibitions; the first, an inaugural one, to take place in May, divided into two sections; one section is for plants not for competition, that is to say, arranged according to the taste of the exhibitors, and composed of choice species and varieties remarkable for rarity, blooming, and cultivation. The other section is for plants in competition, including Palms, miscellaneous species, flowering plants, tree Ferns, and Orchids. There will also be a Rose show, and in July a general exhibition, also divided into two sections. One section to include imported plants, seedlings, examples of cultivation and flowering, general exhibits, special exhibits - Orchids, Palms, Pandanus, Scitaminete, Ferns and Lycopods, Cycads, Conifers, Aroids, Maranta-Lilies and Bromeliads. The other division is for greenhouse plants, horticultural industries, and Plantes d'Appartement. In October there will be a Chrysanthemum show, with special classes for blooming, cultivation, grafting, and cut flowers.

CATTLEYA MOSSIÆ AT MOORTEBEKE.

The houses of MM. Lucien Linden et Cie., at Moortebeke (near Brussels) have lately been filled with glorious masses of Cattleya Mossiæ, which attracted many admiring visitors. Among the varieties of this Orchid were C. M. moortebekeusis, flower very large, petals and sepals warm rose, lip golden yellow, save where the inferior lobe is veined with bright rose. The two spots on the throat extend to the upper edge, which is much curled, undulating, and bordered with white above. The lip slopes very sharply. One variety has a straw-coloured throat, with a deep violet-red spot on the lower lobe, the edges fringed, bordered with white; in another, the large lip is open, showing the column, the throat rich citron yellow, two great spots of the same tint on the sides of the tube; the lower lobe veined with bright rose. A third variety has an extra lip, well formed, the bottom of the tube golden-yellow, the lower lobe of the lip bright carmine; another has a long and beautifully-coloured lip, the bettom of the throat golden-yellow, the front of the lip bright rose, the edges fringed. Yet another variety has a handsome lip with two old-gold spots at the opening of the throat, and another purple carmine marking on the lower lobe, the edges fringed, undulating, and bordered with clear rose. Ch. D. B.

SOCIETY OF JERSEY GARDENERS .- The above young but certainly go-ahead society is to be congratulated on the success of its initial effort of Thursday, July 16, in the Triangle Park, Jersey. The fite was indeed a success, as evidenced from the fact that the gate receipts amounted to £141 5s. 3d., leaving, after paying expenses, a sum of £60 5s. 6d. The fete opened with a presentation to Mr. PINTIP BAUDAINS, Constable of St. Helier. There were more than 500 exhibits, and among some of the principal prize-winners were Mr. E. Gould, Mr. SINGLETON, and Mr. G. T. DAY among the flower group. Mr. A. Luxon, the popular president, secured a Silver Medal for the best collection of Gladiolus: Quite a feature among the exhibits was a display of Carnations by Mr. Thos. S. WARE, of Hale Farm Nurseries, Tottenham; another fine display being those of Mr. P. LE CORNU, of the Jersey Nurseries. The arrangements altogether were capital, but the society were somewhat overwhelmed by the success of their first endeavour, and but for the hearty cooperation of one and all, great confusion might have occurred. Some 3000 persons visited the show during the evening.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Daydogrees—a "Day-dogree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending July 25, is furnished from the Meteorological Office: -

"The wrather continued fine, dry, and very warm during the earlier days of the period at all except our extreme northern and north-western stations. Later in the week, however, unsettled, rainy conditions extended from the westward to all but our extreme south-eastern districts, the rain being very heavy in the west and north towards the end of the week. A sharp thunderstorm was experienced over

"The conth-cast of England on the 24th.

"The temperature was very high during the early part of the week, but subsequently fell decidedly—especially in the north, with the result that the average for the week was a liftle below the mean value in the north and west of Scot land, and only equal to it in 'S sotland, E.' and 'Ireland, N ; in all the English districts, however, as well as in 'Ireland, S , it was again somewhat above the normal. The highest of the maxima were registered, as a rule, on the 21st, and varied from 88° in 'England, E, and 8,' and 86' in 'England, N.E.' and the 'Midland Counties,' to 75° in 'Ircland, 8,' 72° in 'Ircland, N.' and 'Scotland, N.', and 68' in 'Scotland, W.' The lowest of the minima, which were recorded during the and 38' in 'Scotland, N,' to 17' in 'England, S' and 'Ireland, N,' to 50" in 'Ireland, S,' a d to 53° in the 'Channel Islands.'

"The rought was again considerably less than the mean in 'England, E. and S.' and the 'Midland Counties,' but exceeded it in all other districts. In 'Scotland, Ireland, and England, N.W.' the excess was very large.

"The bright sanshine was very deficient in the Irish and Scotch districts, but exceeded the mean in England. The percentage of the missible duration ranged from 63 in the

Percentage of the possible duration ranged from 63 in the 'Channel Islands,' and 54 in 'England, 8,' to 24 in 'Scotland, E.' and 'Trekand, 8.,' to 18 in 'Scotland, N.,' and to 16 in 'Ireland, N.

SEEDS.

LONDON: July 29. - Messrs. John Shaw & Sons, Seed LONDON: July 29. — Messrs, John Shaw & Sons, Seed Merchants, of Great Maze Pouel, Borough, London, S.E., write that there is now an improved side for Trifolium, and as supplies are moderate, holders are realising higher prices. The new English Winter Tares now coming to market show excellent quality. Fine new home-grown Giant seed Rye can be bought on tempting terms. White Mustard is in better request at full rates. Sowing black Ripeseed comes good in quality, and low in price. Canary is substantially higher: the earlier estimates of the Turkish cron were too favourable. There is no chance of the Turkish crop were too favourable. There is no change in Hempsoed. Blue Peas and Huicot Beans meet with but little affention.

CORN.

Averages. Official statement of the average prices of Bottsh Corn, imperial measure (qr.) for the week ending July 25, and for the corresponding period last year — 1896; Wheat, 24s.; Butley, 19, 8d.; Oats, 15. 11st. Wheat, 24s. 1d.; Butley, 19, 10d.; Oats, 15. 11st.

Australia: J. W. E. We are unable to inform you what are the prospects of your engaging in the business of a florist in the larger towns, although we may be sure that a demand for the elegancies and luxuries of life has greatly increased there in recent years.

Books: A. T. Bulby and Bulb Culture, by D. T. Fish Character Office, 170, Strand, W.C.). -C. B. W. Cucumber Culture for Ameteurs, by W. J. May (Bazaur Office, 170, Strand, W.C.). - H. L. H. Handy Book of Fruit Culture under Glass, 2nd ed. by David Thomson, W. Blackwood & Sons, London.

DISEASED VINE SHOOTS: T. Featon. The appearance noted on the shoots is due to the presence of a slime fungus, Plasmodiophora vitis. See "Vina Diseases," p. 217, of our issue of August 19, 1893. All diseased parts should be cut away and burnt.

Emblematic Planes: Tuffy. We are not aware that (with one exception) there are any plants adopted as national emblems by the countries you mention. The Chrysanthemum is the national emblem of Japan. The Lilies of France (trises) are probably known to you.

INSFORS: A. D., Bournemouth, The galls are caused by the Cattleya-fly (Isosoma Orchidearum), which we have often given illustrations of. The only remedy is to cut off and burn the affected portions, and to look tor and destroy the mature fly.

MEMORIAL CARD: T. M. S. Cupressus funebris; Weeping Willow, Myrtle, Rose, Asphodel. first-named if but one plant be used.

MOULD ON ANGELICA: D, H, W, The mould did not reach us in such condition that its identity could be established

AMES OF FRUITS: A. J. Bateman. 1, Peach smashed; 3, Peach Grosse Mignonne; 2, Nectarine Victoria; 4, Aprileot Moor Park; 5, Apricot NAMES OF FRUITS :

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—D. T. F. Probably, Acacia Seyal. -A. J. H. 1, Campanula rotundifolia; 2, C. Rapunculus: 3, Filago germanica: 4. Hypericum pulchrum; 5 and 6, Agrostis alba; 7. Bromus asper.—J. W. T. We cannot name florist's flowers, especially of Petunias, whose flowers vary considerably even on the same plant.—T. C., Beckenham. The two Fuchsias sent seems to us to be distinct, but we cannot undertake to arbitrate in the matter of dispute on the subject .- J. W. F. The Everlasting Pea seems to represent a really desirable and pretty uew variety just intermediate between the purple and white-flowered varieties. ti. B. The Orchid is Deudrobium moschatum, an old and rather common species.— W. P. J. Epidendrum alatum.—C. W., Leyland. Your seedling is one of the finest double Fuchsias we have yet seen. —J. T., St. Albans. Stipa pennata (Feather grass).
—Il'. Il'. and A. F. Colutea arborescens, the Bladder Senna.—N. C. 1, 2, Ferns too young to be determined: 3, Plumbago Larpentae: 4, Geranium prateuse: 5, Antennaria margaritacea: 6, Rhus Cotinus, the Wig Plant: 7, Anthriscus, probably; but there are no flowers.—E. J. Impossible to name a withered scrap without flowers.—Lionel. Seeds of Encephalartos, a plant of Palin-like habit.

Peaches: IV. C. d. Son. The fruits arrived as an unrecognisable mass of pulp. The rotten state may be due to Monilia fructigena. Can you send fruits showing an earlier stage of the attack of tho fungus !

ROYAL HORTICULTURAL SOCIETY'S EXAM NATIONS. $J.\ H.$ The Secretary, Rev. W. Wilks, 117, Victeria Street, Westminster, S.W.

TOMATO: D. C. It is not at all unusual for Tomato fruits not to ripen at the base, and yet there is no disease. They, however, soon ripen if placed in the sun.—Gardener, Belfast. The Tomato was so pulped up when it arrived, that nothing could be made of it. If there is mould on the leaves, it results from the close atmosphere, and would be relieved by veutilation.

TOMATO GRAFTED ON POTATO-STEM: Garilener. Tivoli. The union is perfect, as the 3-feet height of stem and eighteen fruits in all stages of develog-The flavour is excellent, and on ment manifest. the score of wholesomeness they leave nothing to be desired. We remarked that the tubers on the roots are very small in size and few in number.

Tomatos: T. B. To show these culinary fruits in a collection of fruit might disqualify the entire

VINES INF.STED WITH MEALY-BUG, &C.: You will not be enabled to do much in freeing the Vines of insects whilst the foliage is on them, although you might see what effect the XL All vapour would have at the present time. As the Vines are very old, it might be better to clear them out, and start anew.

CONTINUED INCREASE in the CIRCULATION OF THE GARDENERS' CHRONICLE,

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gordeners Chrocicle" has, since the reduction in the price of the paper,

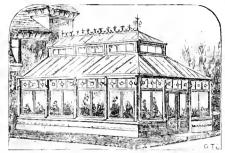

Increased to the extent of more than 90 per cent.,

and that it continues to increase weekly.

Advictives are remixed that the "Chronicle" circulates among country centreven, and all classes of Gardenries and Garden-Lovers at home, that it has a specially large foreign and colonial circulation, and that it is preserved for reference in all the principal Libraries.

AND SIMPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s. If set across three Columns the lowest charge will be 30s. Page, 28; Half Page, 24 10s.; Column, 23.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertise-ments must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be quaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others.—It is very important in remit-ting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postat Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may

full from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advartisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, Including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to II. G. Cove.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

MR. J. C. STEVENS begs to announce that he has now completed negotiations with several of the most prominent Nur-erymen in Holland to Continuously Supply his Sales, during the coming season, with only really First-class Bulbs, of the best quality.

A supply of Catalogues can be sent on application.

GREAT CATTLEYA and LÆLIA SALE.

GREAT CATTLEYA and LÆLIA SALE.

ON FRIDAY, AUGUST 14 1896.

A OREAT VARIETY OF THE GRANDEST TYPES.
A Consignment of
CATTLEYA SCHRODER.E.—There is hardly any Cattleya in existence of such grand shape, none so deliciously scented, it is easy to grow, and free to flower. Its blossoms are very large and of great substance. From the district whence we originally imported this grand Cattleya—unequalled for form and delicacy of colour—and which has yielded the incomparable Schrodere alba and other forms of great worth. More distinctive-looking plants have never been received. Varieties are certain.

CATTLEYA VELUTINA.—A handsome, highly fragrant species of great merit. Sepals and petals orange, spotted and streaked with purple. Lip of a soft velvety appearance, orange and white, streaked with violet.

ATTLEYA HARRISONIE.—The large-flowered, dark-coloured violacea type. A large consignment, in best order. Gathered in the district whence we obtained the atmost scarlet-crimson Tring Park variety, and the white Measuresize. We can thoroughly recommend these plants. Their thick, plump bulbs, strong old flower-spikes, evidence their vigour. Six to eleven flowers are borne on a spike, and the firm texture of the blossoms, their pleasing colour, and the length of time they last, render them of great service for floral-work.

ELIA DORMANIANA.—Flowers, in shape, somewhat resemble Cattleya superba, sepals and petals olive-green, marbled with wine-purple, lip bright purplish crimson, lateral lobes rosy crimson, veined with purple. Free to flower and extremely useful.

LELIA HARPOPHYLLA, the Flame-coloured Lielia, stands alone in the genus, unapproached in brilliancy, distinctness of colour, and elegance of shape. The flowers are a brilliant orange-coloured vermilion, the lip bordered with white. Invaluable for bonquets, buttonholes, &c.

LELIA PR.ESTANS.—The darkest, most richly-coloured type known; sepals and petals brilliant rose, lip of the deepest Tyrian purple. The most nent, compact, and, in proportion to the size of the pl

plants, offered as received, and consisting of the above-named species.

ONCIDIUM ROGERSH.—A spleudid variety of O. varicosum.
The true large flowered, golden-yellow form. As many as 170 huge blossoms, each 2½ inches across, are borne on brauched panteles. Plants in superh condition SOPHRONITIS GRANLIFLORA.—A consignment of this vivid scarlet-crimson-flowered gem in excellent order, also ORCHIDS in FLOWER and BUD.

MESSRS. PROTHEROE AND MORRIS will SELL the foregoing grand ORCHIDS on August 14, at half-past 12 o'Clock, in their Central Auction Rooms, 67 and 68, Cheapside, Loudon, E.C., by order of Mesers. F. Sander & 68, Cheapside, Louder, Co., St., Albans.
On view morning of Sale, and Catalogues had.

MONDAYS, August 17, 24, & 31. THURSDAYS .. 20 & 27.

DUTCH BULBS.

SPECIAL TRADE SALES.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on

MONDAYS, August 17, 24, and 31. And THURSDAYS, August 20 and 27,

AT Twelve o'Clock each day, large consignments of NAMED HYACINT'HS. TULIPS, CROCUS, NARCISSUS, and other DUTCH BULBS, together with white ROMAN HYACINTHS, and paper white NARCISSUS, received direct for Unreserved Sale.

These early auctions have been specially arranged in lots to suit the Trade and other large buyers.

The Auctioneers will be pleased to enter the names of intending purchasers on their permanent lists who may desire a regular supply of Catalogues for these Sales.—Auction Rooms and Offices 67 and 68, Cheapside, London, E.C.

An importation received direct of 550 CATTLEYA TRIAN.E., the contents of 15 cases just to hand, in good condition, for Unreserved Sale; also, 1 CATTLEYA GASKELLIANA ALBA, with 6 bulbs in flower; and 1 CATTLEYA MISS WILLIAMS (HARRISONI.E × GASKELLIANA), with 6 bulbs in sheath, now offered for the first time.

MESSRS. PROTHEROE AND MORRIS will include the above in their ORCHID SALE on FRIDAY NEXT, August 14, at half-past 12 o'Clock.

On view morning of Sale, and Catalogues had.

Birmingham.

ESSRS. THOMAS JAMES AND DAVIES have received instructions from Messra, F. Sander & Co., St. Albans, to SELL by AUCTION, at their Sale Rooms, 35, Temple Street, Birmingham, on THURSDAY NEXT, August 13, at 12 o'Clock, a large Collection of IMPORTED and ESTABLISHED ORCHIDS, in great variety. Upwards of 500 Lets. 500 Lots.
Catalogues post free. Commissions carefully executed.

Birmingham.-Dutch Bulb Sales.

Birmingham.—Dutch Bulb Sales.

MESSRS. THOMAS JAMES AND DAVIES commence their SALES of DUTCH BULB's at their Rooms, 35, Temple Street, Birmingham, on THURSDAY. AUGUST 29, and continue to Sell every MONDAY and THURSDAY, nt half-past 11 a.m., until the end of the season. The Auctioneers have made arrangements with reliable growers this season for shipment of Fifty Tons, and the Bulbs are all good, sound, and reliable. Catalogues post-free. Commissions carefully executed.

N.B.—THOMAS B. JAMES commenced these BULB SALES in Birmingham in 1890, and from a modest beginning they have steadily grown to their present large size (as many as 2000 lots being sold in one Sale).

SATURDAY, AUGUST 8, 1896.

HORTICULTURAL CONFERENCE AT CHESTER.

THE horticultural show and fite at Chester this week were inaugurated on Tuesday evening by a horticultural conference, held in the Town Hall. The Mayor of Chester (Mr. B. C. Roberts) presided in the absence, through indisposition, of the Duke of Westminster, and the following deputation attended from the Royal Horticultural Society of England :-Sir Trever Lawrence, Bart. (President), Mr. Philip Crowley, F.L.S. (Treasurer), the Rev. W. Wilks, M.A. (Secretary), Messrs. Thomas Statter, Chas. Shea, George Bunyard, T. Francis Rivers, George Paul, Jas. McIndoe. A large attendance also included the Very Rev. S. Reynolds Hole (Dean of Rochester, Mr. F. W. Burbidge, M.A., F.L.S. (Trinity College, Dublin), the Sheriff of Chester (Mr. J. E. Holmes), Mr. George A. Dickson, Mr. E. J. Baillie (Chester), &c.

The Mayor, in offering a hearty welcome to the members of the Horticultural Society of England, expressed regret that the Duke of Westminster was unable to be there—what they hoped was only a temporary indisposition-to preside. He believed it had only fallen to the lot of one other provincial city to have a deputation of the Royal Horticultural Society among them, and on that account they undoubtedly appreciated their presence all the more, and gave them a hearty welcome to their ancient and historic city.

Sir TREVOR LAWRENCE, Bart., then read an interesting paper upon "The Royal Horticultural Society of England: its History and its Work." The inhabitants of Great Britain during the last half century had grown so accustomed to be surrounded by flowers in town and country alike, that they had come to regard the present state of British horticulture as a matter of course; but no one who carried his mind back to the beginning of the century could fail to be struck by the extraordinary progress which gardeners and gardening had since made. During the century new near its end, trees and shrubs, annuals and perennials, flowers and fruits had been introduced from foreign countries in vast numbers, while the abilities of several generations of gardeners had found full scope for their exertions among a garden-loving people in improving the old, and raising new varieties of garden fruits. After describing the foundation of the society ninety-two years ago through the exertions of Thomas Andrew Knight, and its early history, including the granting of a Royal Charter in 1809, Sir Trevor said a valuable feature of the Society's work, and one which had had a great and enduring influence on British horticulture, lay in the steps taken in 1818 to get from various

countries valuable shrubs, plants, and seeds.

The earliest arrivals came from China and from India through the East India Company, and in this way many valuable plants were introduced into Great Britain. The success of these efforts encouraged the Company to send out with great success collectors at their own cost.

Sir Trevor afterwards referred at some length to the vicissitudes through which the Society passed after the death of the Prince Consort, until at the end of 1887 a move was made which had the effect of entirely rehabilitating it in public opinion. As to the present position of the society, if it had done anything to repair the errors of the past, and inspire confidence in the future, it had been by sticking resolutely to its last, bearing constantly in mind that the function of a horticultural society was to cultivate horticulture, and with a fixed determination to clear off outstanding liabilities and to avoid debt. In reducing the minimum subscription to one guinea, the Society was actuated by a desire to enrol among its fellows as large a proportion as possible of the vast numbers of their fellow-subjects who were interested in gardens. The result of this and other changes had been, on the whole, eminently successful, the average annual pet increase in the number of fellows being for several years 280, and the total number 3300, against a maximum, so far as could be ascertained, of 2500 in the old Chiswick show days. The Journal of the Society was published regularly, the committees included a large number of the principal horticultural experts in the kingdom, while the great shows of the Society, held now for several years in the gardens of the Inner Temple, by the continued kindness of the Benchers, had been, in many respects, the finest ever seen in Great Britain. The fortnightly shows were now largely attended, and attracted such a number and variety of exhibits as made it increasingly difficult to find room for them. The Society's fruit show at the Crystal Palace bade fair to become an important annual event. The Society had spent during the ninety-two years of its existence not less than £100,000. That it had made mistakes and wasted money, its best friends would not deny; but it might confidently be asserted that it had done and was doing good work which no other society could do -work of great value to the community.

DEAN HOLE ON "GARDEN URALL,"

Dean Hole followed with an address on "Garden He said when a benevolent florist remarked to him that he wished every man in England had a garden, and he replied "Heaven forbid," the florist looked at him with sorrowful surprise; "because, he (the Itean) continued, "in a very short time his gift would be abused. In a very short time a large number of his allotments would present the appearance of the garden which was covered Groundsel, because the proprietor said he did not think it right to prejudice the soil in favour of Strawberries." Alas, for this toilsome, wearisome world, the real love of a garden was very very rare. If his friend had said, "I would that every man who loves a garden had a garden to love, then he would have assented to his proposal with a sevenfold amen; but it was not so, although the love of a garden was born in us either as a dim recollection of Paradise Lost, or as a bright prevision of Paradise Regained There were few really enthusiastic gardeners. There were a lot of pretenders and shams; a large proportion of the community could not help seeing that a garden was a beautiful thing, and could not help admiring the glowing colours of Nature, and saying, "Well, it is the sort of thing a fellow must have, don't-you-know." If they would only confess their ignorance, one would be satisfied; but somehow or another they perhaps inherited a big conservatory or turned out a lot of bedding-out plants, and set up to be gardeners. They declared they were intensely fond of flowers, and would "give you anything in the world to see your garden." When one told them they could see it for nothing, they came and did not even look at the flowers but began to talk about the Great Wheelat Earl's Court, or Charley's Aunt, or the Pope's Encyclical, or the Eton and Harrow match. There were a lot of people who called themselves gardeners but who only cared for a flower because it was scarce. There were a great number of persons who only cared for flowers as they cared for furniture, because they made the drawing-room pretty, or drove the neighbours green with jealousy. Let them ring out the false and ring in the true, and consider what the old gardeners could do to help the younger. What was garden-craft? Surely it meant getting the greatest possible enjoyment out of a garden. A garden ought to be a place of quiet rest and meditation, and at the same time of cheerful exercise; it ought to be a place of tender memories and immortal hope. What could they do to help the young gardeners to make it such ' In the first place, he thought a garden should have adaptation to the scene around it. It should be like part of a picture, and the whole of the surroundings should be studied. There should be a union between horticulture and architecture; they should correspond with each other. He would have the house, at all events, partly covered with the most beautiful creepers. What they wanted in a garden must be expressed in two lines. It must be a place-

"Where order in variety we see.

And where, though all things differ, all agree."

He would strongly recommend the young gardener to begin by selecting some specialty, and give his attention to some particular class of flowers. In passing he could not refrain from offering to Mr. George Dickson, of Dicksons Limited, thanks for the wonderful popularity he had conferred upon Mrs. Reynolds Hole. It was Mr. Dickson who sent out the flower, and perhaps no Carnation had had so long a popularity. The young gardener might also take up some special collections, such as Japanese plants. He believed the time would come in this country when a great many gardeners who had thought these new Japanese introductions were not hardy, would feel very envious when they saw specimens of them in the gardous of those who had been more venturesome. Then there should be in some form or another a collection of alpine plants. He must express his surprise as a gardener that those plants had not been received more extensively in England, because he could not imagine anything more beautiful than these little gems appearing in the early spring. After dealing with bedding out plants, Dean Hole said he believed every real, hearty, carnest gardener had the same amount of enjoyment. He verily believed a poor man had as much satisfaction in a window plant as his friend Sir Trevor Lawrence had in the most splendid Orchid. He would in conclusion, warn young gardeners not to be too anxious to improve Nature, lest in trying to embellish they should rather disfigure creation. He warned them not to have anything to do with clinkers or powdered bricks or bottle-ends. Let the young gardener also be abstemious in the use of statues; and let him beware of artificial water, thee from mud banks and stagnant pools. He was bound to say the most genial and sympathetic friends with whom he had met, were those who loved a garden.

TIII. LIFERATURE OF HORTICULIURE AND GARDEN LIBRARIES.

Mr. F. W. BURBIDGE, M.A., F.L.S., remarked that though we had ample proof of the existence from the very earliest times of gardens, gardening literature was exceedingly scanty until we reached the middle of the thirteenth century, when the printing-press appeared. After the year 1500 all our records went to prove that the evolution of gardening and gardening literature went on side by side, each acting and reacting most beneficially on the other. After tracing the history of gardening literature down to the time of the great Charles Darwin in 1859, he said if they studied the list of books on gardening they would find a good deal more chaff than wheat. After printing became general they got a good book in ten years. Really great gardening books, however, were much more rare. After Gerarde's Herbal in 1597, there was no real great work until Miller's Dictionary appeared in 1731 Modern horticultural literature really dated from the beginning of the present century. Horticulture was greatly aided by the general poetry and literature of our country. Gower, Chancer, Spenser, all the Elizabethan poets, including Shakspeare, alluded to flowers, and all the great story-tellers had, in one way or another, used the garden as a stage. A good many people had begun to feel that a good garden was another name for a beantiful book, written and printed by the finger of God.

The Sheriff of Chester (Mr. J. G. Holmes) proposed a hearty vote of thanks to the gentlemen who had read papers. He hoped the members of the deputation would find Chester not only a splendid agricultural centre, but a splendid horticultural centre also. The climate and soil of the district were well adapted to the cultivation of fruit and flowers, and although it was somewhat disappointing to see so many orchards neglected in that beautiful Vale Reval of England, he trusted that show might be the means of remedying the defect. He trusted they were inaugurating a show that evening which would be a successful and lasting institution in the future. He was very pleased to hear Dean Hole's remarks on window gardening. The streets and the architecture of Chester were well adapted for this kind of decoration, and it would add another charm to their quaint old city, and make its streets brighter, gayer, and more cheerful.

Mr. E. J. Baillie (Chester), seconded, and the vote was carried with acclamation.

The Rev. W. Wilks proposed a hearty vote of thanks to the Mayor for presiding. As a very humble specialist—a specialist in Poppies—he strongly supported the Dean of Rochester's advice to young gardeners to take up a specialty. It did not matter how humble the flower, fruit or vegetable might be; if they only devoted their energies to it as a specialty, they were absolutely certain to improve it for all generations to come. Bedding out, upon which Dean Hole had also touched, was not all bad. It was only so very bad because fifteen or twenty years ago, gardeners did nothing but hed out. To do nothing but bed out was pre-emienently bad; to neglect bedding out altogether was, to his mind, only a little less bad. What they wanted was the bappy medium. They wanted their herbaccous borders, their regular old English gardens of quaint, sweet-smelling flowers. He did not think that they wanted very many of the great big scentless Roses, scentless Carnations, and scentless Begonias without any form. They wanted their old English flowers, and they could make plenty of room for bedding out in its proper place as well. Let them try as gardeners not to run to one extreme or another, but to hit off the happy medium and utilise those wonderful advantages and resources which the great Creator of all had placed at the hands and disposition of gardeners.

The resolution was seconded by Mr. T. STATTER, Stand Hall, Manchester, and carried; and the Mayor's reply brought the proceedings to a close.

THE ROSARY.

THE NEW RACE OF HYBRID TEA ROSES.

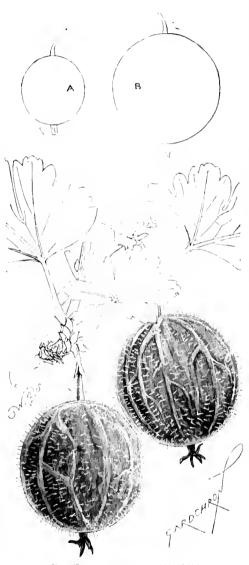

In his charming chat about Roses on pp. 90 and 91 in a recent number of the Gardeners' Chronicle, Dr David R. Williamson, in praising his new loves, by no means neglects or ignores the old. On the contrary, he places such established favourites as Duchess of Albany, Caroline Testout, and La France, at the top of the list, not only for growth, but fragrance and beauty, calling the latter, as it deserved to be, supreme, the queen of the garden in the present, and probably unsurpassed for form, fragrance, colour in the future. A good many attempts have been made to improve, alter, or change the colour, and no doubt, as we can hardly imagine it possible to have an excess of La France in our gardens and landscapes, the more we can have of La France character and style of Roses, the better. Hence, different, deeper, lighter shades of pink, crimson, yellow, orange, white La France would be welcome. Hitherto, however, efforts to get La France Reses of different and distinct colours have not been very successful. The so-called whites have had a strong dash of pink, or a stain of orange or of yellow; the deepened pinks have dashes of dull carmine or purplish hues of the somewhat dull type of Cheshunt Hybrid; in fact, the colour is about the one great fault of this Rose, and I am rather surprised it was passed without comment by Dr. Williamson as one of the most meritorious of all the Hybrid Teas, and one of the finest companions to Gloire de Dijon. With a new and brighter colour-yes; but with its present purplish blend of colour-no. Better mate the Glory with the hybrid perpetuals -Salamander, Duke of Edinburgh, General Jacqueminot, or the much more brilliant Hybrid Tea, Reine Marie Henriette. But La France seems about as perfect in colour as in size, form, fragrance. The nearest approach to a white La France is found in Augustine Guinoisseau, and that is so inferior to the type that one can but be glad it was not a success. If we are to have a white or golden La France from seeds, or bud, or branch sports, let us hope that they will be equal, or if that be possible, superior to the type. The colour is so soft and charming, so delicately blended and shaded with silvern rosy-lilae, that we can hardly have too much of it in the garden.

And then we have darker rosy-pinks in Danmark and Duchess of Albany, a dash of salmon in the pink of Caroline Testout, a deeper dash of carmine-rose in La Fraicheur, with more of carminerose and vermilion in the newest hybrid Tea, Marquise Litta. Higher praise could hardly be given than that awarded by Dr. Williamson to the Gold Medal Rose, Mrs. W. G. Grant, shown at the National Rose Society, viz., that it unites the dignity of Lady Mury Fitzwilliam. I like this phrase, so far as I remember applied to a Rose for the first time, and admirably descriptive of Lady Mary at her best-unites the dignity of Lady Mary with the distinctive fragranco of La France. Surely more likely lines could hardly be followed to give us more or improved La France Roses, for yet we can make ample room for such.

THE NATIONAL ROSE SOCIETY AT ULYERSTON.

In A. H. K. B.'s books of pleasaut essays, there is one on the expression. "Under the circumstances," in which he shows how it does service in a great many instances, and softens the fall when things do not quite turn out according to anticipation. When the National accepted the invitation of the North Lonsdale Rose Society to hold their northern show for this year at Ulverston, some wanted to know where Ulverston was; those who were officially connect d with the society knew very well that it was the headquarters of one of the affiliated societies which has always shown signs of a vigorous existence, that it had a good working executive, and a very indefatigable secretary in Mr. J. Mackrath; it was said, however, that as it involved a six hours' journey from London, and that as the weather was very warm, and the season very early, southern exhibitors would be out of the running, and that altogether a very indifferent show might be anticipated. Using the phrase "under the circumstances," it may safely be said that these gloomy auticipations were not realized, and that a much better exhibition was held than might have been expected. Opinions will always vary as to the comparative excellence or otherwise of exhibitions, and so very opposite opinions have been expressed with regard to this show by Rosarians. The judgment of the general public does not count for much, but it only shows how wide is the interest created by the National Society, and how loyally its members strive to support it, that so many exhibitors from the South put in an appearance. It is true, that in the nurserymen's classes we missed all the southern growers except Messrs. Prior of Colchester. Messrs. Mount, Mattock, and Burrell, the grand H.P.'s shown by the two firms of Cant at Colchester, and Paul of Cheshunt, were not to be seen, nor did Messrs. Prior exhibit any 11.P.'s; while the falling off of the amateur exhibitors of Teas, was very remarkable. This is self-evident when we find that the names of Orpen, Berners, Page Roberts,

Burnside, Foster-Melliar, and Hill-Gray, were not to be found, yet notwithstanding this, there were, according to Mr. Mawley, forty-two exhibits from south of the Trent. On the other hand, the midland and northern exhibitors had a good time of it, and this is as it should be, as it was for them that the Northern show was established, and while no one grudges the winner of the Trophy the double-first that he has taken this year, many would have been better pleased if it had been taken by a midland or northern exhibitor. To those who came from a distance the weather was also very trying: one exhibitor who brought up his Roses from the South, told us he had never experienced such a night since 1872, and that the railway vans were like ovens; another told us

 $Fro. 27 = cooserrerry (excellence extension). \\ A cross between extension (excellence excellence). \\ Fro. 27 = cooserrerry (excellence). \\ Fro. 27 = cooserrerr$

that all the blooms that he had staged in his boxes were useless when he got to Ulverston, and that he had to rely entirely upon "spares"; one exhibitor who showed Teas very well, exhibited from a piece where the Roses had been planted in a low-lying position. where the earlier blooms had been cut off by the May frosts, and the Roses that he showed were from the shoots which had been produced after this misfortune (if misfortune it can be called), which turned out so favourably for him. As might have been expected, Messrs, Alex. Dickson & Sons came out very strong, especially in the marter of new Roses, in which indeed they were the only exhibitors: Mrs. W. J. Grant has never been shown so well as in the box which obtained for them the first prize for the best light Rose, twelve blooms. There is little doubt that this very distinct Rose will occupy a

leading position when it is more widely distributed. Messrs. Dickson also obtained the Gold Medal for the best seedling or sport, Muriel Grahame, which has already been noticed in the report for the metropolitan show. It is a fine Tea, a sport from either Catherine Mermet or The Bride, and distinct in colour; they had also in their stand of new Roses a bloom of Alice Lindsell, which seems to be a promising flower. It is a beautiful cerise-pink, in the style of François Michelon, and we shall probably hear more of it another time. Maman Cochet was again to the front, and obtained a Medal for the best Tea in the nurseryman's class, and was won by Messrs. Merryweather. Beside the box of Mrs. W. J. Grant, there was a superb box of Caroline Testont, from Messrs, Croll of Dundee, and another of Mrs. John Laing, from Mr. Geo. Mount of Canterbury. The other medals for the best Rose were awarded to Messrs, Mack, for a bright bloom of Victor Ilugo; and in the amateurs' class to Rev. J. H. Pemberton, for a fine bloom of Catherine Mermet; and Mr. J. T. Marden, for a good Her Majesty.

It was hardly to be expected that garden Roses could be shown in such good form as they were by Mr. Machin. Of course, single Roses were all over, but his stand, consisting mainly of Teas, Noisettes, and Polyantha effectively arranged, attracted much attention. A good deal of interest centred in the competition for special prizes, the Veitch Memorial Medul and £5 having been awarded to a southern grower-Mr. H. P. Landon, of Brentwood. The prizes offered by Mr. Victor Cavendish, President of the local society, consisting of three pieces of plate, were awarded to Mr. Whitton of Bedale, Mr. E. B. Lindsell of Hitchin, and Rev. J. H. Pemberton of Havering. Thus again do the southerners come in, although Mr. Whitton, a northerner, took the 1st prize. It is to be noticed, as has been done before, that there is a great searcity of northern amateurs; it has been so retimes thought, and truly so, that the exhibitions encourage growers to come forward, but it has had comparatively little success in the north. Twice the society has been to Durlington, and fewer exhibitors come from that neighbourhood than formerly; once it has been to Edinburgh, and we doubt if exhibiting has been much improved in and about the Scottish capital. It is possible that Ulverston may be an exception, but there is an evident feeling amongst trade growers that the South is more favourable to them. Messrs, Harkness & Sons have opened their establishment at H tchin, Mr. Burrell has come down from Darlington to Cambridge, and Messrs. Dickson & Sons have gone to Ledbury. On the whole, then, the exhibition at Ulverston, though not comparable with that of Derby last year, or the most of our northern exhilitions, was better both in numbers and quality than could have been expected. There were no sensational blooms, nor anything that will much linger in the resarian's memory. The arrangements, as might have been expected, were admirably carried out, and reflected great credit on the committee and their excellent Secretary, Mr. Mackrath.

A NEW GOOSEBERRY.

A FIRST-CLASS Certificate was awarded by the Fruit Committee of the Royal Horticultural Society at the last meeting to a Gooseberry named Langley Beauty, exhibited by Messrs. Jas. Veitch & Sons, Royal Exotic Nurseries, Chelsen. This seedling variety was raised from a cross between Yellow Champagne and Railway, and is another remarkable instance in which the fruits produced by the seedling exceeds in size those upon either of the parents. To illustrate this, a single fruit from each parent is engraved upon fig. 27 above the representation of the seedling. It was intended to combine the larger berries of Railway with the upright habit of growth and greater flavour possessed by the latter. This has apparently been done; and, it may be added, the fruits of the seedling, beside being of first-rate flavour, are of a yellowish colour and handsome in appearance.

REMARKS ON THE FRUIT CROPS.

(See Tubles, pp. 124 to 131.)

OUR annual synopsis of the numerous reports as to the condition of the fruit crops was presented to our readers in our last issue. The returns then published embrace almost all of the counties in Great Britain and Ireland, also the Channel Islands.

From the reports we have been favoured with, it is obvious that but for the unusual drought, the season's fruit crop would have been an overflowing one. Under all circumstances, it is satisfactory to find that there are such average crops as were returned in the summary of last week. The tabular matter already published allows of little detail, and doubtless extracts from fuller remarks upon the subject will be interesting to the greater number of the readers of this journal. The matter that the courtesy of our correspondents has placed in our hands, however, is so voluminous, that only a proportion of it—mostly typical cases, and containing useful and specific data upon certain varieties—can be used.

0, SCOTLAND, N.

Morayshire. The fruit crops in this district are looking exceptionally well, and promise to be early. Apples of nearly all sorts set well, excepting Lord Suffield, and since the heavy rains of last month, they are swelling away fast. Apricots (which were in full flower by the end of February) and Plums set an immense crop, and both have had to be severely thinned. Peaches are also a good crop; the foliage is clean and healthy, and promises well for another season. By the end of this week (second week in July) we shall be able to gather Waterloo and Early Beatrice from south wall. R. C. Webster, Gordon Costle Gardens, Fochabers.

NAIRNSHIRE.—This season's fruit crop in Nairnshire, and, as far as I can learn, all over the North, is the best that has been for a number of years. Apples are an exceptionally heavy crop, and they are swelling very well now, although rather stiff for some time. Pears on the whole are about an average crop, except in the case of Jargonelles, which are a much better crop than any of the other varieties. Damsons and Plums are very good. Green Gages are very heavy at Kilravock; the Victorias are, strange to say, the only failures. Cherries looked very well in the carly season, but did not turn out well in stoning, and are only now an average crop. Small fruits are very fine, Strawberries being an enormous crop; Competitor seems to do very well here, some of the fruits being 4 oz. in weight. Gooseberries, Black Currants, and Raspberries are also far above the average crop. Alexander Ross, Kilvarock Custle.

— Fruits are a fair average crop, Gooseberries and Raspberries above the average; Gooseberries so much so, both in quantity and weight, that the branches are borne to the ground. Apples a good crop, especially Blenheims; old strudard trees, which had no crop for years, are loaded. Pears are very lightly cropped. Standard Victoria Plums loaded; those on walls very thin. Cherries thin; dropped when stoning. James Maithaud, Cardor Custle, Naira.

1. SCOTLAND, E.

ARERDEENSHIEL.—Fruit trees in general had a very abundant blossom. Apples set well, but during the hot dry weather in May, some of them got over-run with fly and thip, causing the fruit to drop off, so there is not such an abundant crop as was promised at one time. Pears did not blossom abundantly, but et well; they are a thin crop. Plums are extra, and have had all to be thinned. Small fruits are all a large crop, except Strawberries, John Forrest, The Gardens, Hando House, Abardeen.

Banffshire.—Fruit in general is a fair crop. Strawberries have been very deficient, and Pears are thin. Peaches in some situations are thin, but very early. I had Alexander Peaches in the first week of July on the open wall. July 19 was the earliest date I have hitherto picked from the same tree. Small truit, with the exception of Black Currents, are very plentiful. J. Fraser Smith, Culling terming.

BERWICKSHIRE.—The fruit crops in Berwickshire are on the whole exceedingly good this year. There is without exception an abundant crop of all kinds of fruit usually grown in this district. Perfect weather conditions prevailed down to the month of May, and fruit-trees under cultivation set their fruit in great abundance. We have had sufficient rain during the past six weeks to keep crops in a healthy growing condition, so that from a point of quantity, quality, size, and finish, the fruit is everything that could be desired. The fine dry autumn we had last year left the Apple, Pear, Plum, Cherry, Peach and Apricot trees in a good fruitful condition, and the absence of late spring frosts was all in favour of 1896 being a fruitful year. In districts like this, where the soil is of a light nature, lying on gravel, the want of snow and rain during the winter and spring months has been felt to some extent, and the lack of moisture in the ground has caused the above-named trees to drop their fruit in quantity, but still there is sufficient left to form an abundant crop. Strawberries, Raspberries, and other small bush-fruits, are decidedly above the average, and there is a good demand for them in the different markets about, while prices range very favourably to the grower. Garden and field Potatos promise to be a very heavy crop. They have a fuxuriant appearance everywhere, and up to date there is not the slightest trace of disease. Early varieties are giving a return much above the average, and the size and quality are excellent, John Mackinnon, Ayton Castle, Ayton, N.B., July 15.

—— On the whole our fruit crops are above the average. There was a very full bloom and an absence of frost, consequently a thick set, but the dry weather that succeeded prevented many from swelling. The Plum crop was exceptionally heavy. Of the newer Plums, The Cza: and Sultan we find most useful. Among Apples of less newer sorts, Bismarck, Sandrungham, Lane's Prince Albert, Bramley's Scedling, Baumann's Red Reinette, and Pott's Seedling, are most useful and reliable. Our best Pears are Williams' Bon Chrétien, Benrré d'Amanlis, Benrré Super lin, Louis Bonne' of Jersey, Marie Louise and Doyenné du Comice, John Cairns, The Hirsel Gardens, Coldstream.

East LOTHIAN.—I have never seen Plums finer nor earlier, the first dish of Rivers' Early Prolific having been gathered on 13th July. A few Peaches were ready on the same day; and the earlier Fig on the 18th. The last named is the finest crop we have ever had. Apples are clean, and if not large, will be well coloured. R. P. Erotherston, Tyninghame.

FIFISHERF. This is the second good fruit year in succession, an anusual circumstance for Fifeshire. There are partial failures among certain varieties, but they are due to the extra crop these varieties here last year, illustrating again the necessity of thinning heavily-loaded trees. In the famous Pear locality (Newburgh), some of the varieties, such as Bearre d'Amandis, are very scarce. The appearance of the fruit now indicates a difference of at least two weeks in the earliness of this season compared with last. W. Williamson, Tarrit.

KINCARDINESHIRE.—The fruit crop in this neighbourhood is the best I have seen during the last ten years. We had a fine spring, free from frosts, and we have not suffered very much from dry weather. At present all trees are very clean and healthy. If. Knight, Fosque.

Kinross-Shiffe.—Although fruit blossom was very abundant this year, owing to the cold and rather wet season last year, I think the trees had not strength to set their fruit. Jno. Fortune, Blairadam Gardens.

MIDLOTHIAN.— The weather since the end of August last year has been decidedly favourable in this district to the fruit crops. A dry and sunny autumn ripened wood and flower-buds thoroughly, and was followed by an extra dry mild winter, and a spring free from severe frost. Fruit trees consequently flowered well, and set fruits in great abundance. A rather dry period followed, which caused the young fruit to suffer a good deal from drought

and insects; but the rain came early in June, and saved a good crop in most places. Some of the most regular-bearing Apples have failed, however, to a great extent this year, including most of the Codlin tribe; while varieties that do not always bear regularly in succession, such as Blenheim Pippin, Wellington, Alfriston, Beds Foundling, Tower of Glamis, Emperor Alexander, are heavily laden. Of the regular bearers, Ecklinville, Warner's King, Woreester Pearmain, Prince Albert, and King of the Pippins are among the best this season. Plums are a very fine crop, Jefferson, Kirke's, Victoria, Pond's Seedling, Early Transparent, Early Prolific, Czar, Belgian Purple, Denniston's Superb, Coe's Golden Drop, and many others, being heavily laden. Cherries are a good average, all the popular varieties bearing well; Early Rivers fully maintaining its high reputation as an early black variety. Peaches and Nectarines on the open walls are an extra good crop; and so are Apricots, all the varieties, but especially the earlier sorts, bearing full crops. Bush fruit is good all round. Superlative Raspberry is a grand cropper, and much the best red variety grown. Royal Sovereign promises to be a standard Strawberry here. where so few varieties do well on the light soil. Malcolm Dunn, The Gardens, Dalkeith.

PERTHSHIRE.—The season has been favourable throughout, and the crop of all kinds of fruit in this neighbourhood, generally, are above the average. Field cultivation of the Strawberry is largely practised here. The crop is heavy, but the prices are far from remunerative. Everything is about a fortnight earlier than usual. We commenced to gather Alexandra Peaches from the open wall on the 9th of July. A. McKinnon, Scone Palace.

Strawberries suffered from the drought very much; caterpillars on Apple-trees are also very bad, but Gooseberry bushes were quite free. Pear trees were very full of bloom, but in many cases few fruits set. Apples are large, early varieties have the heaviest crops. Wm. Wright, Taymouth Castle Gardens,

6, SCOTLAND, W.

ARGYLLSHIRE.—The outdoor fruit crops are promising. Bush and wall trees are clean and healthy. Apples in general are carrying heavy crops of clean fruit; but Pears are much thinner than last year. Some varieties of Plums are scarce, but Victorias are good. Strawberries have been very abundant, and came in early. Morello Cherries are very plentiful. D. S. Metrille, Poltalloch, Lochgilphead.

DUMBARTONSHIRE. — Apples never showed more blossom than this spring, but, unfortunately, a cold north-west wind destroyed the fruits from the side of the trees most exposed to it. Raspberries are excellent, and ten days earlier than usual. Strawberries are also excellent, particularly John Ruskin, which I was gathering on June 10. Red Currants are very plentiful. D. Stewart, Knockderry Custle Gardons.

DUMFRIESSHIRE.—All fruit most ahundant and fine, except Apples and Pears, which are never very plentiful or fine in this climate, especially in this low-lying garden of cold soil. D. Thomson, Drumlanriy.

STIRLINGSHIRE.—The Apple-trees in this district are bearing an extra fine crop of fruit, and making vigorous healthy growth. Pear and Plum-trees were in blossom this year earlier—ten days earlier than usual. The spring frosts, early in April, destroyed many of the blossoms of Pears and Plums, and there is a very space crop. A. Crosbic, Buchanan Gardens.

— Strawberries have been a large crop generally, but several varieties which promised well at one time are to be disearded. Aberdeen Favourite and Rivers' Eliza were worthless, while President and Moffat's Duke of Edinburgh are first-rate. John Ruskin was ripe June 7. M. Temple, Carron, V.B.

Wigronshire.—The season, so far, has been very favourable to the fruit crops. The recent heavy rains have cleansed the foliage of the later fruits from insect pests, which threatened earlier in the season to do much damage. Apples, Pears, and Plums, are bearing

good crops, and judging from appearances at this date, they should finish off fine fruits. Strawberries were abundant; bush fruits, with the exception of Geoseberries, very good. Peaches, Nectarines, Apricots, and Figs are good crops, and earlier than usual. James Day, Galloway House, Wigtonshire.

2. ENGLAND, N.E.

DURHAM.—During the thirty years that I have had charge of these large gardens, I have never known the fruit crops so fine throughout—Apples, Apricots, Gooseberries, an enormous crop: Strawberries also very abundant, measured one fruit, 6¼ inches round—so you will see they are also very fine. The season, though rather dry, has just suited this district. J. Nolle, Woodbarn, Darlington.

NORTHUMBERLAND.—Several varieties of Apples in the garden are a full crop; large trees in orchards are very light. Pears are an irregular crop. Plums on walls are fine, especially Victoria and Jefferson. Apricots and Peaches carry full crops. Of Cherries, the Morello has cast much of its fruit about the district. Small fruits are heavy crops, and of fine quality. The weather was too dry for Strawberries, yet there were some fine crops in this district: Royal Sovereign premises to do well. George Harris, Castle Gardens, Alnuick.

- The fruit crops in this district present, on the whole, a promising appearance. Apples are a heavy crop on such varieties as Niton Honse, Domino, Hunthouse, Fullwood, Stirling Castle, Beauty of Moray, Lane's P. Albert, Prince of Wales, and Warner's King. Pears are good. Durondean, Clapp's Favourite, and Hacon's Incomparable are always excellent here. Strawberries will be a short crop on some soils. In such phenomenally fine spring weather as we experienced, a heavy crop was expected, but April, May, and June, being so dry, Strawberry growers had much ground for anxiety; however, from Alnwick and district as much as 7 tons per day have been sent to market. The quality was, as a rule, good, and prices high. Black and Red Currants are excellent. Raspberry Superlative is again giving us an abundant crop. It is, without doubt, the best grown for either dessert or preserving. David Inglis, Howick Hall, Lesbury,

YORKSHIRE.—Apples and Pears did not set well owing to drought. Plums are an exceptionally heavy crop, especially Victorias, Green Gages, Mitchelson's, and Damsons. Apricots also set well, and had to be severely thinned. All bush-fruits have carried heavy crops, but Black Currants suffered from an attack of fly at the beginning of June, which reduced the berries. J. Riddell, Castle Howard.

- The excessive drought in the spring and summer injured the Strawberry crops where good deep cultivation with abundance of water during the flowering period has not been given, the crop was very quickly over; the varieties that have done best are Keen's Seedling, President, Sir J. Paxton. Cherries abundant and excellent, varieties Black Circassian. Black Eagle, Royal Duke, May Duke, Early Bigarreau, Bigarreau Napoleon, and Elton. Trees that were plauted many years ago against a west wall not giving satisfaction as trained trees, have been allowed to grow as they like, giving good result; they are covered with large nets to keep off birds, and the men can take steps or ladder and gather without trouble-this is the way to grow Cherries, and the pleasure of seeing them hang in their beautiful clusters. Three good varieties are Black Circassian, Royal Duke, and Bigarreau Napoleon. B. Wadds, Birdsall, Yorks.

The fruit crops in this neighbourhood, taken as a whole, are slightly under average. Apples showed an enermous amount of bloom, but set very irregularly. Pears trees bloomed but sparingly, with but few exceptions, which is not to be wondered at when we consider the two heavy crops in succession in 1894 and 1895. Apricots set a heavy crop. Plums bloomed well, but failed to set, excepting Victoria, the trees of which are heavily laden. "This is a bad Plum district." Small] fruits [plentiful, but rather

small on account of the continual drought, with the exception of Black Currants, which are very thin. John Easter, Nostell Priory Gardens, Wakefield.

— Early in the season fruits of all kinds showed a most wonderful promise, but the long drought caused a good deal to drop through the stoning period. Still, all round, we are much above the average, except Pears, which are small and scarce, especially the better kinds. Apples, where grown on the bush system, viz., Paradise stock, are very good and clean. Frederick Kneller, Stadley Royal Gardens, Ripon.

—— Strawberries, heavy crop, chiefly V. H. du Thury and President, which do well on our strong clay land; Royal Sovereign promises to be the best early we have as yet tried, although this year Auguste Nicaise ran it very close for earliness. Gooseberries and red Currants are especially fine and clean; but the Raspberries are beginning to suffer from drought, although they have been good the first two or three gatherings. Apple trees suffered much damage from caterpillars, as well as some Oak trees and a Hornbeam hedge, which were completely riddled. Thos Bonsall, Elmet Hall, Leeds.

— This is what might be termed a good general fruit season. Many kinds of Apples on bush and standard are a heavy crop, while not one is a total failure. The same, too, may be said of Pears; bushes which have not borne fruit for the last five years are carrying heavy crops. Many varieties of Pluns, especially Victorias, are heavily eropped; but many of the trees are badly infested with applies. Apricots are a good erop: so also are Cherries, both sweet and Morellos. Bush fruits of all kinds are plentiful and good for this district. Strawberries have been abundant and very fine—better than for the past five years. J. Hughes, Weatworth Woodhouse Gardens.

— The fruit crop here, taken as a whole, is the best I have had during my service which will soon reach twenty-six years. The fruits are very free from both eracking and black-fungus, which in wet seasons we suffer much from, especially Pears and Apples, to some extent, but not so bad as Pears. Red-spider, aphis, and caterpillar, have given much trouble, the former especially, but by frequent washings with garden-engine and cold water the pest has been kept fairly well down. The season in this district is quite a fortnight earlier than usual. Waterloo Peach ripe on open wall July 6. Win. Chark, Brodsworth Hall Gardens. Doncaster.

— Fruit-trees of all kinds never looked more promising than they did in the early part of the season, and the weather has been all we could desire, except the short supply of rain, which amounts only to 8.44 inches for six months ending June 30, which is below the average since 1887, when it was 6.96 inches. Apples are dropping off, and all trees carrying fruit show signs of distress in places where artificial watering is out of the question, and fruit will be small unless rain comes soon; insects have been plentitul, and caused much labour in handpicking, spraying. &c. About seven miles distant, in the neighbourhood of Beverley, the Codlin-moth is very troublesome this season. Joha Allsop, The Gardens, Dalton Hall, near Hall.

3. ENGLAND, E.

Cambridgeshire.—The fruit crop in this district is good on the whole. Lane's Prince Albert Apples being very good, also Cox's Orange Pippin, Duchess of Oldenberg, Frogmore Prolific, the Ecklinville Seedling being light. Caterpillars were very abundant; I find hellebore-powder clear them off successfully. W. C. Smythe, Upwell House Gardens.

Essex.—Apples, notwithstanding the drought, are a heavy crop; the trees are clean and healthy. Pears promise well; and Plums, but for the blight, would have been of very good quality. All small fruits are suffering from drought. The Cherries are clean and good. Morello Cherries a very heavy crop, but for want of water the fruit is small. Jas. Douglas, Great Gearies, Ilford.

The Apple crop, on the whole, is a good one; the Keswick Codlin is a very plentiful crop, and other sorts are very good. Of Pears, Williams' Bon

Chrétien is a very heavy crop. The small fruit are breaking down with the weight of the crop. E. [Hill, Edmont Castle Gardens.

— We had very good prospects of having good fruit crop during the flowering period, but owing! to the dry north-east winds and frost that prevailed at the time, the crops were considerably injured, more particularly Apples, Pears, and Plums on the standards. Strawberries soon over, through the dryness of the season. Rainfall only 0.28 for May. James Vert, Andley End Gardens.

NORFOLK.—The very dry weather of May saved the fruit crops from three very sharp frosts, which occurred in the last week in May, when the trees were in bloom. After passing through a complete plague of insect pests in the early part of the season, it is quite surprising how well the trees look, after the nice rains of the 15 and 16th inst. The trees are now looking well. Plums and Apples are a heavy crop. I am glad to say the dry weather has thinned some of those that were the most heavily ladened. Trees have stood the drought well. Wm. Allan, Ganton Park.

SUFFOLK.—The Apple crop in this district is an average one, but the fruit will be poor in quality. Trees have been much blighted and infested with fly. Pears are healthy and clean, and above the average. Apricots are a heavy crop—Large Early, Shipley. Roman, and Kaisha, being particularly good. Of Plums, trained trees carry the best crops, but standards are not so good, though, on the whole, the crop is an average one. Strawberries on heavy soils are plentiful and good, but on light soils the crop suffered much from the long drought. Cherries, both dessert kinds and Morellos are thin. All small fruits are above the average, and the quality good. H. Fisher, Flicton Hall Gardens, Bunquy.

— In this district, in the spring, there was a great wealth of bloom on fruit trees generally, but the crops of Apples and Pears are very light. Plums and Cherries are more plentiful. Fruit trees have suffered much this season from the long-continued prevalence of easterly winds, and latterly for want of rain, also from attacks of insect pests. These unfavourable conditions have checked the growth of the trees in spite of light crops, or, in many cases, where there is no crop at all. Although bush fruits are put down as an average crop, the fruit is small in size, owing to the great heat and drought, which has also ended Strawberry picking earlier than usual. John Weillis, Orwell Park, Ipswich.

(To be continued.

FOREIGN CORRESPONDENCE.

NOTES ON AGAVES.

ALTHOUGH Agaves are grown extensively in the Riviera gardens, one rarely finds a good representative collection, and it may safely be stated that there are ouly two or three in the whole Riviera. The cause may be attributed in some cases to the plants (at and after their flowering period) not producing offsets, in which case the species is lost, unless obtained from seed, which is a long and tedious process. chief cause arises from the lack of proprietors taking sufficient interest in the less showy species, those only which produce the greatest effect being utilised. Again, it must be taken into consideration that, owing to the gigantic dimensions which the large growing species attain, space is insufficient in the majority of gardens to accommodate a large collection. Respecting their nomenclature, it is very difficult to determine the species by descriptions given in different works, which are in most cases taken from plants cultivated under glass, and which are very different in character from the same species grown under natural conditions.

Amongst the variegated varieties I have seen as many as four distinctly marked offsets from the same plant, which may account for the numerous varieties to be found in cultivation.

The point of the flower-stem of the Agave when in

a state of rapid vegetation has a tendency (contrary to most plaots) of turning in an opposite direction to the sun. I have recently proved by microscopical observations, that the cause for so doing is the heat of the sun's rays, which causes a greater development of the cellular tissue, and thereby produces a slight contraction on the shady side.

Viviparousness (production of bulbils instead of flowers) of Agaves is not only confined to A. vivipara (syn. A. contula), but occurs often amongst other species. A. Ixtlii usually produces hundreds of bulbils, and I had occasion last year to note a very curious freak in the case of A. polyacantha. The plant in question produced several small bulbils at the summit of the flower-spike, and at the base in the centre of the rosette of leaves five more were produced, which continued growing quite six months after the plant had flowered.

Manuring of succellent plants (which has already been discussed in these columns) is beneficial, and I have observed that in the case of Agaves it produces a greater development of the whole plant, and I have every reason also to state that it prolongs their lives for at least a year or two, for when allowed to suffer from drought they have a tendency to flower sooner, as is the case with most plants.

As a barrier-plant, which has already been noted by M. Naudin, there is only one point to add—that they should be planted in a double row, so that in the event of a plant flowering (which would leave a gap), the plant in the second row would keep the hedge intact.

The economic value of the Agive has been always neglected, but I am perfectly convinced that a large industry might be established in the Riviera for the production of fibre: and farmers who grow perfumery plants (many of which scarcely pay the labour) might find a greater remuneration in the culture of these plants. Their resistance of slight frost, and occasional snow (which are sometimes experienced here) has been already thoroughly tested, the great drawback being the lack of machinery for the manufacture of the fibre, and it would be well if the French Government turned their attention to this fact. Riviera.

ODONTOGLOSSUM GALEOTTIA-NUM AND MILTONIA SPECIES.

The illustrations (figs. 28, 29) represent a nice specimen of Odontoglossum Galeottianum, and an unnamed species of Miltonia, growing in the gardens at Brookhurst, Alderley Edge, Cheshire. The first-maned is, as is well-known to lovers of Orchids, a Mexican species, allied to the better-known O. nebulosum, although in its manner of growth and form of pseudo-bulb it resembles O. Cervantesii, and it is still computatively rare in gardens. The flowers are, as will be observed in the figure, produced on short racemes, white, with the exception of the petals, which are barred with brown at the base, and the lip, which has a few yellow-coloured streaks at the base. A coloure I plate of this species is given in the Orchid Album, ix., 423.

METHODS OF PROPAGATION.

(Continued from p. 97, July 25.)

Budding in the routine of norsery work, and it is so simple that all gardeners, many amateurs, and I may say all rosarians, know how to do it skilfully. It diffes from grafting chiefly in one important particular, that in the grafting process, the piece of inserted wood (the scion) is really a part of the tree to be propagated, carying two, three, or even more buds; whereas in the budding process, the single bud only is taken, attached to a yery small portion of the bark, with no wood. This bud, with its shield, as it is appropriately called, is inserted under the bark of the stock, not on it, so that the cambium of both are in close contact, and become in the growth-process truly united.

The great secret of success in this operation is lightness of touch and quickness of manipulation, thus avoiding any bruising of the bark of either stock or bud, and also the drying of the sap in either. It is not surprising, therefore, that many ladies are very successful budders of Roses, their needle-work, and perhaps piano-playing being just the gymnastics to train the fingers, and I should not be greatly surprised that some adept type-writer, wishing for a short holiday in the open air, might venture to answer an advertisement for a skilful budder in some Rose nursery, to be a great success, and eventually to marry the young proprietor. Vailat another opening for women!

I have "in my mind's eye," two ladies particularly, whose husbands are successful Risegrowers, who do all the budding required, and have but break through anywhere, leave rough pieces of Briar littering the fields to hang up in the fleeces of poor sheep, and so cause a great amount of irritation if not trouble, and work for "the Beach." Such men should not be encouraged, though they, more often than not, get the hest Briars. From October to Christmas is the best time to plant them, but the roots should be chopped off almost close in to the stem, as more often than not the so-called roots are nothing but clubby pieces of under-ground stems, with, at most, two or three fibres on them; whereas, if the Briar be chopped close, fresh rootlets are encouraged to form, which is more conducive to success as regards the Briar, but also, later on, for lifting, when a proper head is formed.

This, then, is the preliminary for standard Roses, but do not plant many tall stems, unless one or two of

FIG. 28.—ODONTOGLOSSUM GALEOTTIANUM.

Grown by Gustav Kleinjung, at Brookhurs', Alderley Edge, Cheshire.

their reward in seeing their husbands' names at the top of the local prize-list, while they appropriate to themselves the chief honours in the class for basket, vase, or bouquet of Roses at the leading exhibitions of the "queen of flowers."

The universal stock is the wild Briar Rose, of which there are many varieties, the kind to be preferred being that which is almost thornless, clean-growing, about three years old, and well-ripened, but not too rough.

In almost every country town, at any rate in the south, there are skilled collectors of Briars, who, having permission from landowners, make a respectable living in the winter by hunting up copses, hedgerows, and woods for Briars, which they sell to local nurserymen, or consign to London and other firms. Unfortunately, there are men who take "French leave," and not only trespass, but are not above snaring a hare, or knocking down a pheasant should one be handy; while such have no regard for hedge;

extra height, on which to work such kinds as Turner's grand multiflora Rose - Crimson Rambler, and the Improved Japanese Briars lately introduced to the trade by Paul and Waterer. These will make handsome pendulous trees for the middle or back of the rosary. For general purposes, anything from 21 to 3 feet is tall enough, and the best results are obtained from 11 to 2 feet Briars. Do not plant deep; 9 inches in light soils, and even 6 inches in clays and heavy loams being quite deep enough; tread firmly, and let the hoe be worked among them freely in dry weather to keep the cracks filled, and to expose the soil to the air; afterwards, with an occasional "tread-np," they will take care of themselves, and in the spring will break freely. Disbud, only allowing three laterals (at the most) to grow at the top of the Briar. Should the weather he warm and growing, some of the most forward Briars will be ready to receive a bud by the end of June, the general practice being to insert at that time all the buds of the new Roses of the year one can compass. Alas, how few of these come to stay! But it is as well to give all a fair trial on every kind of stock. Perchanee we may entertain an angel unawares. The Briar in use should not be soft or sappy; on the other hand the bark should lift freely from the wood.

If you are budding from a new Rose, it will most probably be a pot-plant; therefore, take it bodily to your bed of stocks and begin. With your flat-handled budding-knife (Saynor's No. 204) begin in the angle formed by the shoot and the stock, and make a clean straight cut through the bark parallel with the sides of the shoot, and long enough to enable you to insert your bud easily; but do not make any cross cut. Then raise the bark tenderly on each side of the cut, and take your bud, being cautions that you do not drag out the heart of the bud when removing the wood from the shield, as the piece of bark

fine flowers for exhibition are sought, eventually only the lower bud should be left, and when the Briar is headed back 1 inch above this, let the cut portion be smeared over with grafting wax or cobbler's wax made more fluid by the addition of turps. The laterals that remain on the stock, when ripe, should be taken off to make Briar cuttings, this, in my experience, being the best form of dwarf stock in use, even the much-vaunted seedling Briar, which more often than not is too thin for any but skilled workmen to bud, while its tendency is to produce many suckers, as the adventitions growths from the crown are called. Besides this we have the Italian or Manetti stock which I cannot recommend, La Grifferaie, and the Napoleon stock-more properly Rosa laxa. The first soon makes a strong dwarf bush, and so is very acceptable to nur-erymen who wish to produce

Fig.~29.- MILTONIA SPECTIS, Grown by Gustav Kleinjung, at Brookhurst, Alderley Edge, Cheshare, (See p. 1989)

carrying the bud is called. Now insert the bud under the bark of the Briar, pushing the base home as far as you can to the bottom of your cut: close the bark evenly, and then bind with budding cotton, so as to exclude the air, and the operation is complete.

When the leaf-stalk of the bud comes away freely between finger and thumb, you may shorten back your laterals; but do not do this unless you want the buds to start, for best results appear when the inserted bud remains dormant throughout the winter. Should, however, the season be a growing one, and the Briar vigorous, a respectable head may be formed even the first summer—but patience is preferable. In a month's time, the cotton must be loosened, and if the bud has pushed and lengthened, put on a top-stick made of a split Briar or other stick thinned at the bottom, and secured tightly to the Briar. To this tie the growing bud with soft raffia. lest a sudden wind blow it out. It is not advisable to put in more than two buds on each stock, and if

something showy and saleable in as short a time as possible; but these plants, under the best and most careful treatment, get seeble, and, on the other hand, throws up such a number of suckers that they at last kills the bud. Even should these be taken off as they appear, such a practice must in time weaken the stock and the Rose, eventually even killing it. In a word, the Manetti is not the stock for the amateur who wishes for success. The Grifferaie-properly, "multiflora de la Grifferale"—is an exceedingly vigorous stock, often making shoots from the root 6 feet long, and is used for hudding on the most vigorous Tea Roses such as Madame Berard, Tea hybrids as Cheshunt Hybrid, and some of the more rampant Noisettes, as Gloire de Dijon, Cloth of Gold, and Reved'Or. It is not so apt to "spawn up" as the Italian stock, and when it does, its large, deep green. glossy leaves are at once discerned by the least practised eye. Although it encourages strong growth, it does not induce a free-flowering habit.

The last-named stock, the Napoleon, is admirable for Tea Roses, causing the bud inserted in it to develop into a shapely pyramidal plant, very shortjointed and floriferous, some of the weaker Teas thriving better on it than even on the Briar, from seed or cutting. It is not yet common in our nurseries, but on the continent, among Rose growers, it is a great favourite. The process of budding for all these stocks is the same as for the Brian, but in the best nurseries the stocks are "opened out," as it is called, viz., a portion of the soil in which they are planted is taken out around them to the depth of about 6 inches, and the bud inserted below the ground level, waiting till the buds are started and have grown a foot or so, and then returning the soil. This protects the bud, prevents its blowing out, while in many cases it encourages the Rose to root into the soil, and so become eventually even independent of the stock.

All the above-named stocks are easily raised from cuttings, made of the young matured wood, avoiding such that is pithy, and bedded out in rows from 6 to 8 inches apart in late autumn or early winter. Thus treated they will root, and be generally ready to take a bud in the following July, or to lift and pot for gratting in January to March. Experience.

EARLY AND LATE VARIETIES OF CHERRIES.

It is rarely that a bad year as regards Cherries occurs at Syon, although the soil of the garden might not be supposed a very suitable one for the Cherry; and at the time I am writing—the middle of the month of July, the trees, unless frequently afforded water, would suffer greatly, especially those which are heavily eropped. Cherries seem to suffer worse than other stone fruit in a droughty summer like the present, the trees rooting near to the surface. It is not good practice to crop the border close up to the Cherry-trees as is often done, the roots being then compelled to go into what is perhaps a poorer soil, with the result that gumming and canker are set up, and the trees are soon spoilt. It is surprising how well a Cherry-tree will fruit if the roots can run beneath a hard path, doubtless obtaining moisture in such places. In a hard soil the roots become very fibrous and have many ramifications, and although they are near the surface, they do not become unduly dry. From trees in a poor, light, sandy soil the truits are not so fine as those from a retentive, rich soil, and black-fly gives more trouble. Moreover, in light land a Cherry-tree is not long-lived if it be not well nourished; still, with proper attention to the needs of the tree, regular crops are obtained which ripen much earlier than is the ease in retentive land. This season at Syon was the earliest of which we have a record, ripe fruits being gathered early in the month of June. The variety Early Rivers was the first to ripen. It is a very fine dessert fruit, black, handsome, and of fine quality; it is a seedling from the Early Purple Gem. The tree thrives exceedingly, never fails to fruit in quantity; but its season is short, and the stone, being small, there is more flesh than with varieties of the same size. The tree is not vigorous at Syon.

I recently saw some very fine fruits of the variety on a bush growing in au unheated house. Another variety not so well known as it deserves is Bigarreau de Schreken, a large, black, shining fruit of the highest quality, the tree an excellent one for planting on a south or west wall, and coming in, as it does. just after the Early Rivers (this year it was ripe at the same time, and being a dessert variety, it is a very welcome addition to early Cherries. I first saw this Bigarreau in the gardens of Gunner-bury House, Acton, Mr. Hudson having a very fine tree, which, for pot-culture, never fails to hear fine fruits. It is one of the best varieties, making good growth, and prolific. Another excellent Cherry is Black Tartarian, a large, fine Cherry, forcing well, but not always thriving in cold soils. With us it never fails to bear fruit; the trees are moderate growers. The fruit is of first quality, and it is in season in the third week in July, rather later when planted on an east wall, but its chief value is its earliness. As

fate fruiters, there are Wender's Early Black, a fine wall Cherry, coming into use after those named, but coming in with Kuight's Early Black, and Black Tartarian, I merely notice its good qualities in this garden. Among later black varieties there are many very fine fruits; indeed, with Cherries, both early and late, there is no lack of variety. The old Black Heart, a variety much grown on standards for market, brings much fine fruit when afforded a place on a wall. Black Eagle is a great cropper, but is not valuable on light land, as it is wanting in size. Both of the above are in season early in July. Bigarreau de Hadelfingen is a very fine black Cherry, which is in season at the end of that month, a heavy cropper, with fruits of the finest flavour, and of especially good quality when grown on a west wall.

One of the best late varieties here is St. Margaret, or Tradescant's Heart, a favourite late July fruit, which keeps well into the following month. I do not recommend the variety for cultivation as a pyramid or bush in light soil, but as a wall Cherry, as there it can be readily protected; and my experience with bush or pyramid trees is, that they require good soil and proper cultural attention to get fine fruits, and plenty of them; and unless protection can be afforded them, the birds devour the fruits wholesale, and large pyramids and bushes are difficult to protect from them.

In light red and vellow-fruited varieties there is a wide selection, including some of the finest grown. Frogmore Bigarrean is a large pale yellow fruit. marbled with red, and it is one of the richestdavoured, and the tree good in any form. It is not the earliest Bigarreau, B. Jaboulay being earlier. This last is a grand variety for a tree against a wall. Empress Eugénie, an early variety, is one of the best of the Duke family, noted for size and good flavour. The fruit is of the May Duke type, and the tree is a fine wall Cherry. The Cherry most favoured among the lighter-coloured is Governor Wood, a large pale red fruit, and the tree a grand cropper; indeed, I have never known it to fail here, and on a west wall it is in season in the middle of June. The variety may be termed one of the best, though it failed with me on a wet clayey soil in a garden in the West of England, and I make a note of this failure to prevent disappointment. It is worth the trouble of making a special border for it by draining, and adding lighter soils, as well as mortar-rubble and charred earth. Those who admire large fruits would do well to grow Bigarreau Monstreuse de Mezel. whose fruit resembles that of Napoleon in colour, but it is a much finer fruit, with a very rich flavour. This is a Cherry which Mr. Rivers of Sawbridgeworth grows well in his cool Cherry-houses, and it is a fine variety for walls, and is in season in the middle of July. In my opinion it is one of the best of the type at Syon, although not bearing so freely as Napoleon. This last is prolific and good as a tree in any form; its season is the early part of August. Emperor Francis is a fine fruit, late, and well worthy of a space on a wall; it is less known than many others. Royal Duke is excellent on a wall or in a cool house, succeeding May Duke, and also coming of good size and flavour on a cool wall. Late Duke is one of the best late August varieties, large in fruit, and of a bright red in colour, in flavour somewhat acid, but this is a grateful quality to many pulates. It is of much value for its lateness. The Windsor Cherry is very late; we have it in a small state, but though the fruit is large, it is less productive than the others I have named. It was introduced from America. Much depends in Cherries on soil and drainage as regards quality and keeping; and where Cherries can be grown in a cool-house they well repay the expense, and the season during which Cherries can then be obtained renders the fruit very valuable for the dessert. G. Wythes.

A CRICKET MATCH was played by Messrs. Low & Co's club, of Clapton, against Messrs. B. S. Williams & Sos's club, of Upper Holloway, on Bank Hollolay, at Clapton, which resulted in the Holloway team winning.

TREES AND SHRUBS.

BETULA MAXIMOWICZIANA.

In Professor Sargent's Forest Flora of Japan -a singularly interesting and valuable record of his travels in Japan a few years ago, and which has added immensely to our knowledge of the arboreal vegetation of that country—he states that this Birch is certainly one of the handsomest trees in Japan. and that its introduction to cultivation was alone worth the journey. He first saw it in Yezo, a "shapely tree, 80 to 90 feet high, with a trunk 2 to 3 feet in diameter, and covered with a pale orange-coloured bark." Several young trees, from 5 to 7 feet high, are now growing in the collection of Birches at Kew. Their health and vigour were not affected in the slightest degree by the trying February of 1895, so that there is every promise of their development into handsome trees, and that they will form a striking addition to English gardens. Professor Sargent remarks that the leaves are the most distinct feature of the tree, and the other day I measured leaves on one of the young trees at Kew which were 7 inches long, and over 5 inches wide-surely remarkable dimensions for the leaf of a Birch. They are cordate. of thin texture, and dark green in colour. "As they flutter on their long, slender stalks, they offer a spectacle which can be compared with that which is afforded by our silver-leaved Linden waving its branches before some Hemlock-covered hill of the southern Alleghany Mountains." (Forest Flora of Japan, p. 62.) W. J. B.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Dropmore, Metidenhead

winter lettuces.—It is of importance that a sowing of various Lettuces be made early in the present month for spring and early summer use, making one sowing forthwith, and another in about ten days later. A few days lost at this season may mean failure if the autumn should be wet and cool; it is best, therefore, not to err in being late, but to make an early sowing, followed by another, from one of which a stock of plants may be obtained that will survive the winter. My experience teaches that no variety is better for this purpose than the black-seeded brown or Bath Cos; and for a white Cos, if required, Hick's Hardy White. I rely upon these to the exclusion of Cabbage varieties, but if a Cabbage variety be grown, the hardiest is Hammersmith Hardy Green. The seeds should be sown in shallow drills drawn about 9 inches apart on a piece of land in an open situation, the greater number of the plants to be transplanted when sufficiently large to a south or other sheltered border. Early or quick-hearting varieties may still be sown for autumn use; and the small-headed Golden Queen Cabbage Lettuce is a good one for the purpose.

COLEWORTS.—Plants raised from the earliest sowing will be large enough for planting, and a piece of land in good heart should be planted with them. Any piece of ground that is in fair condition will grow useful heads of these small Cabbages. In planting, draw shallow drills 15 inches apart, and set out the plants at 12 inches apart.

CHOU OE BURGHLEY being a much-prized, delicately-flavoured Cabbage, any plants which may still remain in the seed or unresery beds should be set out if space can be found for them. They are excellent for spring consumption. Lund which has been cleared of a Potato crop will suit them without further preparation beyond a levelling of the surface, and drawing drills before planting, so as to facilitate the watering of the plants now, and the earthing-up at a later date. This variety should be afforded more space than Coleworts, but those planted at this date will do well if put at 18 inches apart each way.

GLOBE ARTICHOKES.—The formation of flower-heads having ceased for this year, the stems which have borne them should be removed by cutting them off close to the ground, together with some of the old leaves, the soil stirre I, and, failing heavy rains, one or two copious waterings should be afforded, and liquid-manure also if it can be obtained in sufficient quantity. The object should be to encourage new growth, which, later in the season, when they are

sufficiently rooted, may be taken off for filling up vacancies in the older beds, or forming new beds. A few may also be potted and stood in a shady place, to be eventually removed to a cold frame.

TURNIPS.—We have had some showers of rain, and advantage has been taken of the softened state of the land to sow another good breadth with Turnip seed, and with further showers, the plants for this sowing will doubtless overtake in growth those from earlier sowings. Tuese last have suffered much from the Turnip-flea, and frequent dusting with soot and wood-ashes has been necessary. Seeds of the yellow-fleshed Turnip, All the Year Round should again be sown, together with Red Globe and Snowball, which are three trusty autumn varieties. The advantages of borders sheltered from the sun for growing Turnips. Spinach, &c., have been very apparent this season, and these kinds of vegetibles are now in excellent order.

CORN SALAD OR LAMB'S LETTUCE, where appreciated as salading, should now be sown in moderate quantity on a warm and somewhat dry border to stand through the winter, and afford a supply of leaves in the spring. Sow the seeds thinly in drills 8 inches apart, and thin to 6 inches in the rows as soon as the seedlings are large enough to be handled easily.

VARIOUS.—With favourable weather take advantage to push on with the planting out of late Broccolis, Savoys, Kales, &c. Celeriac, if planted on fairly rich land, and afforded proper attention in the matter of watering and applying liquid-manure, will yet have time to make useful roots for winter consumption. Make another sowing of Endive, and thin-out and transplant as far as may be necessary those which are fit; also sow a good breadth of Cabbage, and include in this sowing some of the red varieties.

PLANTS UNDER GLASS.

By JNO. McIntyre, Gardener, Woodside, Darlington.

GREENHOUSE RHODODENDRONS having completed their growth will be benefite I if turned out-of-doors for the next two months. Place them in an open position, but one that is shaded from bright sunshine. They require abundance of water at the roots, and it should be rain-water, if possible.

KALOSANTHES.—This is a showy old green-house plant, and of most use when grown in small pots. The plant is best cultivated when propagated annually. When the plants have finished flowering, prepare 3-inch pots filled with a light sandy compost, and insert five cuttings in each of them. Place them on a shelf near the glass, and give shade until they are rooted, which will take about four weeks. When well rooted shift them into 5 or 6-inch pots, and nice plants may be had in bloom during May and June. The present is a suitable time to propagate the plant. If large plants are wanted, they must be grown on from year to year, cutting the shoots which have bloomed hard back soon after flowering. Keep them rather dry until they break, and afterwards shake the plants from their pots, and repot into others of same size; after this, be careful in watering until fresh roots have been made. Give all the light possible, and plenty of ventilation.

ERICAS in small pots may be put into open pits, where they should be plunged to the rim of the pots in sifted coal ashes: this will keep the fine roots of these plants in a healthy condition. No plants suffer more if their pots are exposed to hot sun than do Ericas. It is not desirable or beneficial to pot Ericas oftener than once in two or three years; and in the case of large specimens, they do not need to be shifted oftener than once in four years; but if a plant becomes unhealthy through any reason, it will require immediate attention, a remark that is equally applicable to all hard-wooded plants. The best time to repot Ericas is immediately they pass out of flower. The utmost pains should be taken to have all materials thoroughly clean; to use peat of a hard, gritty nature, adding to it one-third part of sharp silversind, and potting very firmly. Examine the roots thoroughly, remove all dead or decaying ones, but if they are fresh and healthy, disturb them as little as possible. When potted, apply water sparingly for some time until roots have pushed into the new soil. Ericas should at all times be supplied with rain-water, pond or river water, or that which has been exposed to the air for some days.

BOUGAINVILLEAS, whether in full flower or only showing flower, ought now to be removed to a cool airy structure, where the atmosphere is dry. Healthy plants may be greatly assisted by regular waterings with weak liquid natural manure, or a good fertiliser.

161

DIPLADENIAS .- If these have been trained upon strings on the roof, as previously recommended, the latest of them should now be so advanced in growth that they may be removed to balloons and they will gradually assume a natural appearance. Much care is necessary in removing them from the roof to the balloon trellises: and it is better that two persons should do the work. No plants repay careful cultivation better then do Dipladenias. It is sometimes considered difficult to grow and flower them well, but if the wants of the plants are studied, they may be grown with success. Give the specimens a position near the glass in a temperature of 75° to 50, until the flowers are fully developed, then the plants may be removed to an intermediate house where a temperature of 60° is kept. Plants that have almost finished flowering should be gradually allowed to go to rest by withholding water from the roots by slow degrees. The propagation of Dipladenias may be effected now by taking cuttings from partially-matured shoots. Grow them on for three months, then ripen them off.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

PEACHES. - Afford late crops of Peaches in cool houses abundant supplies of water to the roots, more especially needful this season, it having been so unsually hot and dry. Attend to the thinning and regulating of the growths, bearing in mind that in the case of late fruiting Peach-trees the shoots should be less near to each other, and that all possible sunlight should be available for ripening and solidifying the buds and wood. Gross growing shoots should be removed or stopped, as they will be unlikely to ripen satisfactorily. Look over daily any crops which are ripening, and remove those fruits which will part readily from the foot-stalk. If these be laid on wadding in a cool fruit room they will keep for some days in good condition. If plenty of air be admitted day and night it will greatly improve the quality or the fruit, but if birds find their way through open ventilators, it will be necessary to hang a light net—such as is used for protecting Strawherry beds
—over the openings until the fruits are gathered, Less water is needed at this stage, though the roots must not suffer from lack of invisture in the soil. If sufficient water is afforded and mulchings given, whilst the fruits are swelling, there is usually suffi-cient moisture left in the soil to last over the ripening period. See that trees which were forced early are not neglected in the matter of water, and regular syringings or washings with the garden engine are necessary, so that the foliage be kept clean and healthy as long as possible. Even should the leaves be commencing to fall off, as they are likely to do from trees started in December, the border should be kept moist. Should there be any red-spider about the trees, let them be syringed with a good insecticide or a weak solution of soft soap. If the trees are growing weakly, the present time is a good one to remove the surface-soil carefully from above the roots, and apply a liberal top-dressing of fresh turfy loam to which a little crushed bone and one-twentieth part of wood-ashes has been added. Any that are growing too vigorously and fruiting shyly should be lifted, and the roots relaid in fresh soil, watering well in either case as soon as the operation is completed.

LATE VINES.—Continue to afford an ample supply of water at the roots till the Grapes are well advanced in colour, for most late Grapes require a long season to thoroughly finish; and their flavour and keeping qualities depend very much on the kind of treatment afforded during the period of ripeniog, as much as does also their colouring. If the atmosphere be close, they will not be likely to colour well, and they will be deficient in the firm flesh and sugary matter so essential to long keeping. Maintain, therefore, a free circulation of air constantly, afford artificial heat whenever the weather is dull and damp, and so prevent any damp stagnant atmosphere. Look over the vines fr quently, and remove all superfluous lateral growths, and see that no insects are allowed to gain a footing.

THE ORCHID HOUSES.

By W. H. Weite, Orchid Grower, Burford, Dorking.

DENDROBIUMS — Wany of the deciduous species are about to complete their growth, which is shown by the terminal leaf at the extremity of the bulb becoming developed, and the quantity of water applied to the roots should be gradually diminished; but the lints must not be allowed to become too dry, or

they will receive a check which would cause them to finish up prematurely, and soon afterwards to start into growth. Where numbers of these plants are grown, it is advisable to frequently select those that are made up and place them altogether on a side of the house where more light and air can be admitted, and there is less moisture. At this period the earlier-made roots are not only lengthening themselves, but they are sending out a quantity of lateral rootlets, which should be encouraged as much as possible. As stated above, water must be afforded with discretion while these young roots are in progress, and when they have a firm hold of the compost or the sides of the pot or basket, the plants may be removed to a cooler and drier atmosphere. are perfectly safe if put into a vinery from which tho Grapes have just been gathered, or an ordinary greenhouse, taking care to select positions free from draught, and where they will pass from moderate shade to clear sunshine. In such houses the plants quickly become hardened, the leaves soon turn yellow, but although unsightly, these should not on any account be cut off, but left until they fall. Careful judgment should be exercised in watering the plants when at rest, and especially when they are fully exposed to clear sunshine, as oftentimes the sphagmun on the surface of the compost appears to be quite erisp and dry, while underneath it is not so. Where several plants of any one species or hybrid are cultivated, it seldom happens that all of them are ready for removal at the same time, and it is necessary to maintain a hot, moist atmosphere for those that are growing, and to gradually expose them to more sunlight in the morning by pulling up the blinds before the usual time each afternoon. This gradual maturathe usual time each afternoon. This gradual matura-tion will make it more safe to expose the plants to full sunshine later on. The majority of the long pseudo-bulb section, as D. fimbriatum, D. Dalhousieanum, D. dinanthum, D. moschatum, D. clavatum, D. calceolus, D. Paxtonii, D. bioculare, &c., are still growing freely, and will require every encouragement until growth is complete, when they too may with advantage be placed in a somewhat cooler temperature. Some of the evergreen section, as D. den-siflorum, D. thyrsiflorum, D. suavissimum, D. chrysotoxum, D. Farmeri, D. Schrodeiri, D. Griffithianum. D. Guibertianum, and D. sulcatum will have unished their growth; but as these species continue to make roots for a considerable time after the growths are made, do not subject them to a lower temperature for the present : but to prevent, if possible, any secondary growths starting, the plants may be placed in a light position in the Cattleya or intermediate-house, affording sufficient water to maintain root-activity. Plants in small pots of Dendro-bium Phalomopsis that are thoroughly well rooted are now making strong vigorous growth, and requiring almost unlimited supplies of water at the root, with abandance of atmospheric moisture at closing time, and as much sun-heat as it is possible to afford.

D. superbum macrophyllum, and its varieties Huttoni and Barkei, D. primulinum, D. anosmum, D. Parishii, D. Treacherianum, D. sanguineum, D. htmflorum, D. cretaceum, D. crepidatum, D. crystallmum, D. Boxalli, &c., should at this time be in a hot stove like temperature, and have liberal treatment. D. infundibulum and D. Jamesianum do not require so much heat or sunshine as the evergreen or deciduous species, but they delight in copious waterings at the root now that growth is fairly started. The Odonto-glossam-house will suit both until the beginning of

THE FLOWER GARDEN.

By Hebley Warren, G. Warr, Aston Clinter, Telog.

PROPAGATING.—If the preparations advised in a former Calendar have been made, the propagation of summer bedding-plants may now be commenced. Cuttings of Pelargoniums may be tiken as soon as they are ready, beginning with the tri-coloured varieties. Insert these in sandy soil in pots or boxes, and place them in an open, fully-exposed position. Only as much water should be afforded at the first as will prevent the cuttings from flagging unduly, otherwise the formation of roots will be delayed. Ivy-leaved varieties may be given the protection of a cold frame, but plenty of air and full exposure to the sun must be afforded. They will require rather more water than the zonal varieties. Alternantheras, Colens, Iresines, Heliotropes, Azeratums, Fuchsias, Tropacolums, Verbenas, &c., should be put into a sandy soil, and surfaced with elean, shurp sand. Dibble them in about 2 inches apart, and place them in gentle heat. If a little bottom-heat can be given root-formation will be hastened. To vards the end of the present

month, cuttings of Antirrhinums, Pentstomons, Marguerites, &c., may be taken, and inserted in boxes placed in cold frames, or in a prepared bed of soil in a cold frame; this may be about 3 inches in depth, and rest on a hard coal-ash bottom. Surface the bed with sand, and insert the cuttings about 2 mehes apart each way. When rooted, abundance of air should be given, and the plants remain undisturbed until they are transplanted or potted-up in the spring. In the case of Gazanias, 5-inch pots are more suitable. Use a compost of loam, leaf-mould, and sand, in about equal parts, and make it moderately firm in the pots, and cover with a layer of sand. Insert the cuttings prepared in the ordinary way, thoroughly water them in, and place in a cold frame. Keep the atmosphere close for a few days, and sprinkle overhead once or twice daily, and shade from bright snushine.

SPRING BEDDING PLANTS.—Wallflowers, Pansies, Arabis, Alyssum, and others required for spring-bedding should be pricked off into beds or borders already prepared. Sowings of seeds of hardy annuals, such as Nemophila insignis, Saponaria calabrica, Virginian stocks, Silene pendula, &c., may now be made on a somewhat sheltered but unshaded border.

GENERAL WORK.—The recent rains have greatly improved the general appearance of lawns and pleasure-grounds, and mowing has again to be followed up. Where sufficient rain has fallen all gravel paths and drives should be well rolled. If weeds are making their appearance on the carriage-drives dress them with an approved weed killer, or use the hoe—the former is preferable where it is safe to use it. Beds and borders should be frequently stirred, and all weeds removed. Climbers on walls, verandahs, pillars, arches, &c., will require to be kept tied in.

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

BLACKBERRIES.—Varieties of tall-growing habit should have the young growths which have been retained for fruiting next season tied loosely to their supports, and all other growths cut away. Old canes that are carrying heavy crops should be given copious applications of manure-water now that the fruit is swelling. The dwarf varieties, like Wilson Junior, do not usually require much support if they are grown in beds, but where planted in rows against iron hurdles, the young canes must be secured to the supports to save them from injury when the fruit is being gathered. The same attention in regard to removing surplus suckers and affording liquid manure will be needed for these as for the tall-r varieties.

RASPBERRIES.—All the old canes from varieties which have finished fruiting should be removed, and in their place secure sufficient of the stontest of the young canes to fruit next season. Remove all superfluous growths from the stools, and all suckers and weeds which may have appeared in the alleys. A portion of the dry, strawy part of the mulching may now be lightly raked off, which will give the plantation a tidier appearance.

STRAWBERRIES. - The present is a good time for the formation of new beds, and if the ground has been well trenched, and a good dressing of rich manure worked into it, as previously advised, it should be worked into it, as previously access, it should be in good condition for planting. Perore doing this, however, have the surface well worked, thoroughly breaking up the lumps, and levelling it. Then mark out the rows, dividing them into beds or not, as is most convenient. Select a sufficient number of each variety it is intended to plant, choosing those which are the best furnished with roots. Plant them with a trowel in preference to a dibber, and work the fine soil well round the roots, keeping the crowns just above the surface. Each plant should afterwards be thoroughly watered. If the soil is of a light nature, the surface should be evenly tradden over after planting, if it be in a moderately by state. If the weather prove warm and dry the bed should be examined daily, watering those plants which are dry. To grow Strawberries well, the plants should be 2 feet apart, excepting a few weak growing kinds, such as Loxford Hall seedling, which may be planted at 15 inches apart. For the first season, if the rows are 2 feet apart, the plants in the rows may be put I foot apart, but every alternate plant in the rows must be removed after the first season's fruiting. By planting thus, thickly, a good crop may be taken the first

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, Aug 11 Royal Horticultural Society's Committees: Weston super Mare Horticultural Show, Clay Cross, Malvern (West) Horticultural Show.

WEDNESDAY, Aug. 12 Horticultural Shows at Cardiff (two days), Bishop's Stortford, Salisbury, and Sevenoaks.

THURSDAY, Aug. 13 Hortienlural Shows at Farring-don, Leighton Buzzard, Maidenhead, Rothesay, and Taunton.

FRIDAY, Aug. 14 Horticultural Shows at Broughton Ferry, Alderley Edge, and Wilmslow (two days).

SATURDAY, Arc 15 Horticultural Shows at Dumfries and Bingley; Geneva Exhibition, temporary Show (ten days).

SALE.
FRIDAY, August 14 Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -62.7°.

ONE great and long-standing The Chester grievance in the minds of some the R.H S. gardeners is that the Royal Horticultural Society is too exclusively a metropolitan society. To some extent this is true. and to some extent it is inevitable. Nevertheless, it must not be forgotten that the Society has often made great efforts to get into touch with the provincial Societies, and, indeed, it has done more for the provinces than the provinces have done for it. Where was their sympathy and support during all the dismal period at South Kensington? Where was the aid when the desperate efforts to right the old society were made, when a new home had to be found a few years ago, and a new, and, as it has turned out, a successful policy was inaugurated? On the other hand, very many of our readers must retain lively recollections of the strenuous efforts which were made by the Society to hold provincial shows. Horticulturally, those gatherings were all most successful, but the provincial support which should have made them financially profitable was wanting, and excellent as they were, they had to be abandoned. Now, a new departure has been made, a new attempt to interest the provincial horticulturists in the work of the Society has been inaugurated. At York, lately, an influential deputation was present from the parent Society; and, as we are writing, a similar committee is doing good work in the quaint and venerable City of Chester. The Society's representatives have been in both cases well and hospitably received, and we can but trust that the results will be satisfactory, The Conference held at Chester, of which we give a report in another column, bears welcome evidence that a flower show is not the he-all and ond-all of horticulture, though we have little sympathy with the accessories which our friends at Chester have deemed it proper to tack on to their show. Flower shows are excellent things in their way, and the provinces, speaking generally, can organise as good exhibitions -in some particulars, better-than can the Metropolis. Shows require to be supplemented by other means, such as conferences, lectures, and reports, by means of which the knowledge of things horticultural may be diffused. At such gatherings as that at Chester, the Society gets to know what are the special requirements of the provincial societies, and the latter in their turn are encouraged to seek guidance and informatien from the large stores at the command of the parent Society.

The Conferences at Chiswick and elsewhere, —now unhappily, and let us hope temperarily, abandoned—were the means of bringing together a mass of information of the most useful character. They showed better than any other means that has been adopted what is the actual state of those branches of the art and of the science to which they referred; they showed where our deficiencies lay, and indicated the paths of progress for the future. The records of these several Conferences in the Journal of the Society confer great honour on it, and our provincial friends cannot do better than study them, and turn them to advantage.

Among its other duties, the deputation visited the show, and, quite independently of the awards of the judges, picked out for special honour groups or plants which they thought worthy of such a compliment. This reminds us to ask what has become of the Lindley Medal? It was established in honour of the greatest official the society ever had, and the man, of all others, who most powerfully promoted scientific horticulture. The medal has been awarded to a very few cultivators; among them, to the late THOMAS BAINES and to Mr. Anderson, but that was a long time ago; and for years past no such award has been made. Can it be that there has been, in all these years, no cultivator worthy of such distinction? We do not believe it, and we think the visit of the members of the Council of the Royal Horticultural Society to some provincial show might appropriately be signalized by the conferring of this honour on some deserving recipient. It is too late this year; but we throw out the suggestion as worthy of consideration on another occasion.

Another matter deserves consideration, and that is the necessity for bringing the resources of Chiswick more prominently before the provincial societies. Chiswick, with its experimental grounds, and its records of numberless trials, could and should furnish to the provincial societies abundance of information as to the best kinds of fruits, vegetables, &c., to be grown in particular districts, and for special purposes; and it might act as a distributing centre for new and approved varieties, without interfering with the larger operations of the trade. The Society might, for instance, offer specimens of some specially good variety, tested in its garden, as a prize to be competed for at some provincial show. It could and should also render important help in all ques. tions of nomenclature. But it would require a long article to point out the various ways in which the Royal Horticultural Society, and Chiswick in particular, could be made to subserve the interests of horticulture in the provinces. Let us hope that the visit of the Council to the provincial shows will result in the closer union of the metropolitan and provincial societies for the purpose of the advancement of horticulture, and to the benefit of all sections of horticalturists.

ORCHID HOUSE AT OAK ALYN, WREXHAM,-

—The illustration found on the opposite page is one of many which have appeared in these pages illustrative of diverse satisfactory arrangements of plants. Much of a gardener's efforts in the disposition of his plants in glasshouses, is necessarily directed towards hiding, to some extent, the artificial character of their surroundings, and the more he succeeds in effecting this the more generally pleasing is the effect. Here we have a heavy plant-stage, whose end is masked by a group of miscellaneous subjects—Ferns

Dracenas. Codiæums, tiny Palms, and other plants those at the sides being added probably by the photographer, so as to connect the main group with the plants on the side stages. The stages seem very well filled, and the central one being of considerable width, is very properly stepped, thus enabling air and light to reach the plants which stand in the inner rows. Everything about the plants betokens the vigour and floriferousness which result from intelligent cultivation. We are indebted to the kindness of E. Stanley, Esq., Oak Alyn, Wrexham, for the photograph from which our view was taken.

ROYAL HORTICULTURAL SOCIETY. -A meeting of the Fruit and Vegetable Committee was held at Chiswick on July 31. Present, P. CROWLEY, Esq., Chairman; the Rev. W. WILKS, Secretary, and Messrs. WYTHES, J. WRIGHT, WILLARD, BATES, FIFE. CHEAL, BARRON, GLEN, SAGE, and A. DEAN. Some of the earliest of the large number of Potatos on trial were first seen. These ran rather small owing to the drought, but it was noticed that one variety showed much disease of the skin. A few were selected for cooking, and of these Famous (Ross), a nice white flattish kidney was the only one granted an Award of Merit. The now well-known White Beauty of Hebron was found in excellent condition cooked, but it has previously been certificated. Wythes' seedling, also cooked, was fair, but hardly ripe enough. It will be tried later with the late varieties. A considerable number of Dwarf French Beans were then examined, and of these, several that seemed to be good croppers were also cooked. The best flavoured was Benary's Swabiau Foreing, which was very good, but the pods were a little hard. It was resolved that this variety be tested next spring in a housetrial of forcing Dwarf French Beans. Amongst others cooked (but the dry weather had adversely affected the texture of the pods, all being boiled whole) were White Waxgate, Gloire de Lyon and Dwarf Flageolet Wax, all from Erfurt, and Syon Prolific sent by Mr. Wythes, a greatly improved Mohawk. The very extensive trial of Tomatos in pots under glass was next seen. There were of these about one hundred varieties all capitally grown, the chief characteristic of which seems to be their likeness to each other with few exceptions. Tasted for flavour, Golden Nugget was undoubtedly the best. Of more marketable varieties the few selected for awards of merit were Young's Eslipse, Nield's Seedling, both of the Perfection type, but dwarf, short jointed, and very free croppers; and Chiswick Dessert, red in colour and of nice flavour, and very free fruiting. This is dissimilar to Sutton's Red Dessert, also seen in capital form. A large collection was also examined growing on a sonth border outdoors, but no award was made. The committee advised that as no useful purpose could at present be served by continuing these annual Tomato trials, the new varieties being almost entirely reproductions of older ones, and that a few years be allowed to clapse ere another be undertaken. Exception, however, may be made in favour of anything that may seem specially novel if ordered by the committee at the Drill Hall. It is not improbable, that in relation to the Potato, tests applied to culture and general treatment as well as of production, may next year he adopted in preference to the present trial of old and new varieties, as really no marked improvement in the Potato seems to be presented. There is vet a large trial of Beets to be seen as well as of late

The next Fruit and Floral Meeting of the Royal Horticultural Society will be held on Tuesday August 11 in the Drill Hall, James Street, Westminster, 1 to 5 p.m. At 3 o'clock a Lecture on 'Fern Generation, Normal and Abnormal," will be given by Mr. C. T. DRUERY, F.L.S.

A VIOLA TRIAL AT CHISWICK.—It may be interesting to the members of the Viola Society, which holds a Conference to-day in the Royal Botanic Gardens, Regent's Park, to learn that the Council of the Royal Horticultural Society are contemplating having a trial of them at Chiswick next year. The Council were invited to undertake this during last winter, but the change of superintendence then

taking place rendered the adjournment of the trial necessary. The long border on the North side of the hedge of cordon Pears has been selected for the purpose, and a better position could not well be found. It is, we learn, proposed to invite from growers six plants each, of not more than twenty varieties from any one grower. The chief desire is to secure those varieties that are specially suitable for massing or giving good bedding effects. It is hoped when the invitation is issued that it will be largely responded to, and in good time, to enable the plants to be got out not later than October. All who have had experience of Violas in the South know how

ducible to one, and progressive changes in the inorganic world, in the successive formations of animals and plants from the most remote times, are the result of modification and variation. Continuity on the one hand, variation and adaptation on the other, go far to explain the phenomena of Nature.

OREGON APPLE CANKER—We have received from Mr. Hedrick, of the Oregon State Experiment Station, pieces of Apple branches, about an inch in thickness, the back of which is attacked by some fungoid disease, which it is desired to determine. The information sent is to the effect that "about the

that there is no evidence of its being any form of the disease which is known here as "canker," and which is associated with Nectria ditissima. Nor would it appear to be Dothiorella pyrenophora, in which the perithecia form erumpent clusters, since all the perithecia are solitary in themselves, butgregatious. It is essential to have the fungus in its mature condition, when the perithecia are fully formed, and the sporules are developed. It is not stated whether the perithecia are exposed when the slonghing takes place, or whether they fall away with the fragments of the cutiele. This peculiar form of disease, in so far as we can judge from immature specimens, has not been

Fig. 30.—ORCHID-HOUSE IN THE GARDENS OF C. STAMLEY, ESQ. CAR ALTN. WHENHAM. SEE P. 162.

much more satisfactory are] established fautumn plants over those planted out in the spring, where drought prevails, and water cannot be liberally furnished.

SIR WILLIAM GROVE.—The death of this eminent man of science is announced. Sir WILLIAM was a lawyer and a judge, but it is not on this account that his name will be handed down to posterity, so much as for the fruitful principle he enunciated some fifteen years before the Darwinian theory of evolution was promulgated. So long ago as 1842 Mr. Grove, as he was then, showed that heat, light, electricity and magnetism were all mutually convertible—a given amount of heat will develop a definitely proportionate degree of electrical force, and so on, thus all the manifestations of force are re-

beginning of our wet season. September or October there appear on the trunks or branches of our Apple trees small reddish sunken spots. During the winter months these spots enlarge, attaining oftentimes a much greater size than those in the specimens sent (2 to 3 inches long. About the middle of June the small perithecia begin to appear. At the beginning of the next rainy season the back sloughs off, leaving a rough, unsightly wound." The specimens sent belong to the June period, when the cuticle is elevated by the innate perithecia, mostly fissured at the apex. In external appearance these resemble a Macrophonia or Spheropsis, but the walls of the perithecia are clearly immature. At this stage there is an aboundance of delicate threads, but no evidence of fructification, so that it is quite impossible to determine the genus to which the parasite belongs. Suffice it to say.

recognised in this country, but its life history should be traced further on, and especially the fructification determined. $M,\ C,\ C,$

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY FLORAL COMMITTEE.—On the occasion of the meeting on June 13, 1896, the committee awarded First-class Certificates to Mr. C. G. van Tubergen, Jun., of Haarlem, for Iris parvar paradoxa variegata, Calochortus venustus sanguineus; to Mr. Jac. Smits, of Naarden, for Tea Rosa Madame Emilie Charrin, R. T. Mrs. W. J. Grant, R. T. Kaiserin Augusta Victoria, R. polyantha Thalia (White Rambler), R. damascena Duke of York Certificates of Merit to Mr. C. G. van Tubergen, Jun., of Haarlem, for Gladiolus crispiflorus Herb, var. major Hort, Tub., Lilium pardalinum Kell, var. minor. Meeting of

July 11, 189°. First-class Certificates to Messrs. E. H. Krelage & Son, of Haarlem, for Calochortus Plummeræ, C. venustus concolor, C. Weedii, Hemerocallis aurantiaca major : to Mr. C. Vrij Az., of Nieuwenhoorn, for Cratægus oxacantha fol. argenteo marginatis; to Messrs. Jac. Jurrissen & Son, of Naarden, for Quercus rubra Alberti, Rosa polyantha Turner's Crimson Rambler; to Mr. Jac. Smits, of Naarden, for Rosa polyautha Turner's Crimson Rambler, R. indica fragrans Madame Cochet, R. Thea hybrida Madame Joseph Combet; to Mr. P. A. van der Bom, of Oudenbosch, for Platanus occidentalis Suttnerii. Certificates of Merit to Mr. Egb. Kloosterhuis, of Veendham, for Cytisus schipkaensis; to Messrs, E. H. Krelage & Son, of Haarlem, for Gloxinera Brilliant : to Messrs. Jac. Jurrissen & Son, of Naarden, for Rhus Cotinus purpureus; to Messrs, Gratama Bros., of Hoogeveen, for Rosa Thea Madame Jules Siegfried; to Mr. Jac. Smits, of Naarden, for Rosa indica fragrans Princess Alice de Monaco, R. Thea hybrida Madame Caroline Testout, R. hybrida bifera Marchiouess of Londonderry; to Mr. P. A. van der Bom, of Ondenbosch, for Ulmus glabra lutescens. A Botanical Certificate to Mr. J. H. Schober, of Putten, for Cymbidium tigrinum. Votes of Thanks to Messrs. D. J. Tas & Son, of Aalsmeer, for Begonia Scharffiana hybr. Jhr. W. de Beaufort; to Mr. W. van Veen, of Leyden, for Centaurea moschata suaveolens. The treneral Secretary, H. C. ZWART.

"BOTANICAL MAGAZINE."—The August part contains figures of the following plants:—

Sanseviera Roxburghiana, Schultes, t. 7487.— A Burmese species with narrow-pointed green leaves, transversely barred with white, and with long terminal, erect panicles of greenish-yellow flowers.

Cyptanthus Huttoni, of Baker, t. 7488, is a species with recurved strap-shaped leaves produced with the flowers. The latter are borne at the top of the scape in close fascicles, each flower is about 1½ inch long, the following shaped, curved with a reddish-yellow tube, and short oblong-acute spreading lobes. Native of Cape Colony.

Streechilas Hainanensis, of Sir Joseph Hooker, t. 7489. It is a trailing species with linear-oblong leaves, and flattened racemes bearing elongated flowers about 1½ inch long, with very narrow curved, yellow, perianth segments, and a minute lip with a short conical spur.

Admis anurensis, of Regal and Radde, t. 7400, very similar to A. vernalis in habit. The apparent leaves are really, according to Franchet, abortive axes bearing two or three leaves, of which the petioles resemble the divisious of a single petiole, and were mistaken for them. "The so-called leaf is therefore a branch inserted in the axis [axil] of a leafless or almost leafless sheath." It would be very desirable to watch the germination and development of this species.

Silvanum cornwin, of Vellozo, t. 7491. A remarkable South Brazilian species with oblong-acuminate leaves, the petioles being like the stems, densely covered with coarse brown hairs: flowers white, in pendulous clusters.

"THE PANSY."-Mr. ALEXANDIA LISTER, of Rothesay, has recently published a useful little treatise ou the cultivation of this p quilar flower. He begins with the propagation of the plant by seed and by cuttings, and having raised his plants by one or other method, he proceeds to tell the reader how to grow them an I how to show them. The advice given is, as might have been expected from so excellent a practitioner, thoroughly trustworthy, and conveyed in simple language without unnecessary verbiage. To the extent that exhibitions encourage good cultivation they do good, but when they foster one particular form, and that an unnatural one, to the exclusion of others, they do harm. Who that knows the natural configuration of a Viola and what its significance is, could tolerate (except as a curiosity, a Pansy with a perfectly circular outline? However, that is a matter of taste. All that we plead is that so far as possible all tastes should be catered for, and that if a certain standard of properties be insisted on, it should be a rational one, not

an arbitrary one. Mr. LISTER adds to his remarks on Pansies similar observations on the culture of Asters, Carnations, Dahlias, and other flowers, as well as on the treatment of Beetroot, Celery, Leeks, Parsnips, and Parsley. All this is done in 109 small-sized pages, so that not many words are wasted.

EXPORT OF POTATOS FROM ST. HELIER'S, SEASON 1896.—The appended table gives the quantity exported in packages and in bulk, the average weekly price per ton at the St. Helier's States weighbridges, and a comparative statement for the last fourteen years, including the year 1896:—

SWANLEY HORTICULTURAL COLLEGE, - Sir WILLIAM HART DYKE, M.P., presided at the annual distribution of prizes in connection with the Swanley Horticultural College on the 30th ult. In his opening address he remarked that the Institution was unique in our educational system, as being the only college where young men and women were instructed in practical as well as theoretical horticulture. It was instituted in the same year in which he had the pleasure of passing the Technical Instruction Act. The governing body had laid down their educational lines in a common-sense and practical manner. He held the opinion, generally admitted now, that edueation was of too bookish a nature. Books might lay a sound toundation for a commercial training, but practice was needed to equip students for the battle of life. Leading statesmen and politicians were now giving this subject earnest consideration. Foreign countries spared no pains to perfect their educational system. The Germans, especially, had long ago force seen the great struggle there would be. Their technical schools were admirably devised, and the students were taught how to produce an article which would be suitable for the markets of the world and compete tayourably in price and quality with the productions of other countries. The question was seriously engaging the attention of our statesmen, and such institutions as that College would do much to bring about the desired result. Lady EMILY HART DYKE then presented the prizes, and a vote of thanks to her and Sir William Hart Dyke was heartily carried on the motion of Mr. A. J. Waring, seconded by Miss Goodrich Freere.

THE EAST ANGLIAN HORTICULTURAL CLUB on Thursday afternoon last journeyed to "The Clyffe, Corton, Lowestoft, the picturesque marine residence of J. J. COLMAN, Esq., who had very kindly given the members permission to visit these charming grounds. The party numbering fifty left Norwick by the 1.42 train, and on reaching Lowestoft Station proceeded by brakes to Corton, where they were received by the Misses Colman, who, with the head gardener, Mr. Read, conducted them over the grounds. Specially attractive were the numerous and beautiful specimens of Rosa rugosa, Escallonia macrantha, large flowering Privet, &c.; also the fine collection of Carnations. The houses containing Bananas in fruit, and also Peach and Fig trees, occupied considerable attention; Allamanda grandiflora is rarely seen to better advantage than at this establishment. Tea was served at " The Anchor Cafe," Corton, after which the party returned by brakes to "lovely, lazy, Lowestoft." The arrangements were under the charge of the hon, secretary, Mr. W. Wilkes, and were satisfactorily carried out.

"PLANTS AND FLOWERS ABOUT THE HOME."
—This is a little manual intended for the instruction of amateurs. It is written by Mr. James Graham, and may be had from Messrs. T. & J. W. Graham, Wishaw. It deals with the cultivation of plants in rooms and window-boxes, in the simplest, most elementary fashion. The author, however, too often sacrifices accuracy in the names of plants. These are, doubtless, uncouth enough, but when misspelt they become worse than they need be. The use of the word Geranium for Pelargonium is an error that we fear will never be corrected—even the Pelargonium Society could not effect that reform.

DEATH FROM USE OF DYNAMITE.—Colone's ALFRED CAPEL CURE, of Badger Hall, Shifnal, Salop, was killed on July 20 by the accidental explosion of dynamite while he was engaged in blasting the roots of trees in his park.

SANDRINGHAM HORTICULTURAL SHOW.—The annual exhibition of the Sandringham Horticultural Society was held on Wednesday, July 29, in the Park, and was attended by several thousand visitors. The show was visited by Prince and Princess Charles, who were much interested in the various exhibits, particularly some needlework by children from the various schools in the district.

THE FARNHAM ROYAL AND EAST BURNHAM HORTICULTURAL SOCIETY held their annual exhibition in the beautiful grounds of HARRY J. VEHTCH, Esq., East Burnham Park, on July 29.

FLOWER DRAWINGS.—Lady Augusta Llan-OVER bequeathed to the trustees of the British Museum, the cabinet and stand at Llanover, with ten large volumes containing the unique collection of plants and flowers from Nature by MARY GRANVILLE (Mrs. Delany), which it was the express wish of King GEORGE 111. should be preserved in the British Museum as a standard work of Art unparalleled for accuracy of drawing, form, and perspective, as well as for colouring and truth of outline, and close resemblance to nature. She also directed that these volumes are to be placed with the collections of rare prints and drawings, and not with those of botanic specimens. On inquiry at the Museum we learn that no official intelligence has yet reached the authorities concerning these drawings.

"ROS ROSARUM."—A second edition of this delightful work by "E. V. B." has lately been issued by ELLIOT STOCK, 62, Paternoster Row. The work consists of quotations from writers of all nations and all times relating to the Rose. References of this kind are often terribly worn and hackneyed—at

east, the r are so to those who have to read many books and much writing about Roses; but here is a pure source, full of the most delightful and the most apposite thoughts relating to the Rose, and to the average reader the majority of them will be new. The book is quaint in appearance, but paper and print are excellent. We cannot say so much for the illustrations.

PRESENTATION TO MR. GEO. SCHNEIDER. -A short time ago the French Government announced ts intention of conferring the Cross of the Order of the Mérite Agricole upon Mr. G. SCHNEIDER, the President of the French Horticultural Society of London. Thereupon the committee of the Society in Paris opened a subscription-list, with the object of raising fund to celebrate Mr. Schneider's appointment, and to present him with a testimonial in recognitiou of his labours in promoting good-feeling amongst the horticulturists of this country and those on the Continent. On Wednesday week the presentation was made at a banquet specially convened in Mr. Schneider's honour. It was held at the Restaurant Ledoyen, Champs Elysées, Paris, M. H. MARTINET of Le Jardin being in the chair. About thirty members and friends of the Society were present, some of whom had travelled long distances. The company included Mr. FOUKOUBA, Director of the Imperial Gardens, Tokio, Japan; MM. DUVAL. SALLIER, TRUFFAUT FILS, FATZER, &c. In the course of the Chairman's address he pointed out the great services Mr. SCHNEIDER had rendered to his country as a patriot, as a horticulturist, and as President of the French Horticultural Society, and on behalf of the subscribers to the fund was pleased to hand to Mr. SCHNEIDER the Cross of the Mérite Agricole set iu diamonds, an Art bronze representing a 1789 volunteer, and a handsome address, bearing upon it the names of all the subscribers. Mr. Schneider responded, and was most enthusiastically applanded. Letters and telegrams were read from many English and French friends who were prevented from attending. We are sure that many of our readers, but especially those who are personally acquainted with the genial President of the French Horticultural Society of London, will join with us in offering him our congratulations.

HORTICULTURAL CLUB.—The annual excursion took place on the 30th ult., and was probably the most successful one that the Club has ever had. A courteous invitation had been couveyed to the members through Mr. HARRY J. VEITCH to visit Ascott. the seat of Mr. LEOPOLD DE ROTHSCHILD, and Halton, the seat of Mr. ALFRED DE ROTHSCHILD. The party, which unmbered forty-four, included the following members and their friends: - Messrs. Herbst, G. Mooro, T. F. Rivers, P. Kay, The Rev. W. Wilks, Messrs. Selfe-Leonard, P. Crowley, A. H. Pearson, C. E. Pearson, H. J. Pearson, J. Sweet, J. Rochford, E. Mawley, G. Bunyard, A. Watkins, W. J. Grant, G. Paul, J. Laing, J. E. Cockett, H. Turner, H. J. Veitch. and J. H. Veitch. The party were first conveyed from Bletchley Station to Ascott, where, having inspected the grounds, they partook of luncheou in the cricket pavilion, to which they had been invited by Mr.LEOPOLD DE ROTHSCHILD; they then drove across Buckinghamshire to Halton, the seat of Mr. ALFRED DE ROTHSCHILD, the beautiful grounds of which were much enjoyed, and after partaking of refreshment the whole party returned to town. The weather was perfect, and owing to the excellent arrangements made by Mr. Harry J. Veitch, who kindly undertook all the trouble, and to the liberal hospitality of the owners of Ascott and Haltou, everything was of the most agreeable character, so that everyone returned to town delighted with their excursion.

ROYAL BOTANICAL SOCIETY.—At the Annual Meeting to be held on Monday next, the 10th iust., a resolution will be submitted in favour of inviting the existing horticultural and floricultural societies to hold their exhibitions in the Regent's Park Gardens, and of electing, on the Council, representatives of the leading societies. A motion will also be brought

forward recommending fthe society to give, next season, musical promenades to be open to the public on Mondays, Wednesdays, and Saturdays, the charge for admission being fixed at 2s. 6d., 1s., and 6d., respectively. The meeting will be held in the society's gardens on Monday next, at 1 pm. J. S. Rubinstein, Hon. Auditor, R. B. S., 56, West Cromwill Read, S.W. August 5th, 1796.

ORCHID NOTES AND GLEANINGS.

DOUBLE-FLOWERED PHAIUS GRANDI-FOLIUS.

I am led to make a few remarks upon this superb species, in order to draw attention to a form now October) blooming in the bush-house at Bowen Park. Mr. W. Soutter tells me that he found the plant on Stradbroke Island some years ago, at which time it was bearing what are termed double flowers. These abnormal growths occur less frequently in Orchideous genera than in genera of other orders ['ED.]; and while this malformation gives a fulness to the blooms, it cannot be said to add to the beauty of the flowers so distorted. This Orchid is recorded in European works as producing similar flowers in other countries; but I cannot find any notice of its being peculiar to certain individual [plants, as has been proved by Mr. Soutter, who now has the plant he first found bearing, amongst blooms of the normal form, several of the so-called double flowers. These are of the same colouring as the normal form, and the segments are of the usual form and size. The change takes Place in the wings of the column; these are greatly enlarged, and overlap each other on the face of the labellum, and end in a kind of spar at the base. The onter margin is very wavy, and thus resembles the labellum, and the resemblance is the more obvious as the colouring is the same. The attachment of these abnormal wings seems to be somewhat irregular; in the flower I dissected, on the one side the wing was attached only for about half the length of the column. the other was attached from the bottom to the top of the column. The column, like that of the yellow flowering variety Phaius grandifolius, var. Bermysn, shows a tendeucy to become triandrous.

The lesson we learn from Mr. Soutter's plant is, that these malformations are, as regards plants of Phains, persistent, and may be perpetuated, and the number of plants increased in the usual way if considered desirable. F. M. Bailey, in "Contributions to the Queens'and Flora, Borang Bulletin," xici., 1896.

THE RELATIVE VALUE OF SOME VARIETIES OF ODONTOGLOSSUM CRISPUM.

The Journal des Orchidées for July 1 contains further notes on the value of genuine Odontoglossum erispum, and of its possible extermination in certain localities We read that: - "One of our collectors. lately returned from Pacho, and to whom the article in the Gardeners' Chronicle was read (see p. 674 in the last volume), agreed with every statement there made as being absolutely correct. He himself had often seen despatch to England enormous quantities of Odontoglossums, the crates containing which had been passed through Pacho only that they might there be stamped. He added that the famous mountainous region about Pacho is being cleared with extraordinary rapidity, to make room for plantations of Coffee and Tobacco. It seems that the Tobacco is remarkable in quality, and that the cigars quite surpass the best from Havana. There are localities which are especially famous. Formerly Odoutoglossums brought the region into repute: they are disappearing in smoke, being replaced by Pacho eigars. One of the most astonishing things to my father, who it is known discovered O. erispum. is the great number of these plants which have been imported. "I could never have believed," he has often told me, "that there were so many there." Everything comes to an end. I believe to-day that there is more O. crispum, of the finer varieties be it understood, in Europe than in America. I advise

those who possess it to goard it carefully. I believe that in two years there will be no more to import.

Another Orchid becoming extremely rare is the true Cattleya aurea from the Antioquia district, which must not be confused with C. Dowiana from Costa Rica. The plants are much alike, but whereas the true Cattleya aurea is slow in growing, it may live long. I know of a plant dating from our first importation in 1873. Cattleya Dowiana thrives easily, then exhausted with its first growths, fades away, and in Europe generally sustains only an ephemeral existence of two or three years.

It is very interesting to notice with what difficulty Orchids from certain regions are acclimatised in Europe. Almost all from Costa Rica and neighbouring countries, Mexico especially, show this. The only exceptions are for such among them as Lycaste Skinneri, Lodia anceps and superbiens. There must be some reason for this: I think I have discovered it, and will refer to it another time." L. L. Journal des Orchidess, July 1, 1806.

CATTLEYA ELDORADO ALBA.

In E. J. Sidebottom, Esq's Ichoice collection of Orchids at Erlsdene, Bowdon Mr. G. Shine, gr.), is to be seen the finest and largest-flowered variety of the Wallish section of Eldorado that I have met with. It is out of an importation, and the plants of which there are several, are doing admirably. The one in question has larger, and more coriaceous leaves than the normal form, and from one sheath have sprung three extra fine flowers, which stand well above the foliage. and like all albino Cattleyas, arrest attention. The sepals and petals are of the normal form, but large. and white as snow, beggaring by comparison the Freuch white Cattleya Rex. The lip is in proportion to the sepals, roundly ovate, with the centre having a large solid blotch of lemon-yellow, as in a good Cattleya Mossie Wagneri. There is a broad margin of white surrounding the lemon-yellow patch, with a rosy stripe hidden under the column-altogether an unique flower of great substance. J. A.

HOME CORRESPONDENCE.

AN OLD CHERRY-TREE.—While walking through Admiral Parkin's garden at Lyminster, near Aroudel. Sussex with his head-gardener, my attention was directed to a fine specimen of the Morello Cherry, which had a magnificent crop of the fruit, but on examining the trunk I was surprised to find that the woodly portion was all gone and only the bark left, which, with the slightest pressure, broke through, it being very brittle. We examined it minutely and found that there was no signs of any sap-wood left. Francis Fr.w. [The living portion of all trees is that just within the outer bark, so that there is little unusual in the case meutioned. Ed.]

STRAWBERRY BEDS.—Notwithstanding the severe drought, Strawberries, generally speaking, were very good in this district Mandstone). At Mereworth gardens the fruits were very fine in size, colour, and firmness of flesh, particularly Sir C. Napier. Laxton's Noble was the first that was fit to gather outside, and as an early variety. I find it very useful, the flavour being passable in dry weather. I layer this variety early, and plant a few hundreds on a sung border for affording some dishes at an early part of the season, and following the pot-grown plants, and for this purpose Noble is not to be despised. If dry weather should continue, Strawberry beds will still require attention, or failures will be heard of next year. If not already done, the runners old fruit stalks, and some of the lower leaves should be removed, afterwards slightly pricking up the soil, and affording a heavy mulch of rich, decayed manuare, especially if the land be light, finishing with a copious watering. To fruit well next year, crowns should develop early and strong, and be matured by the end of September. H. Mackheim, Mereworth Costle, Maidstone.

GARDEN FETE AT REVESBY ABBEY. BOSTON.—This, the beautiful home of the Ilou, Mrs. Edw. Stanhope, on Wednesday and Thursday, July 22nd and 22nd inst., presented an animated scene. Having many applications from all parts of the country to view the abbey and grounds, &c., Mrs. Stanhope thought

that by opening the park gardens at a small charge she would be conferring pleasure on the public and at the same time assisting the neighbouring parish of Stickney, whose rector (Rev. G. H. Hales), has been making efforts for some years to have the church tower rebuilt. This Stickney parish church is a beautiful edifice, dating from the fourteenth, or beginning of the fifteenth, century. to help on this good work, Mrs. Stanhope, assisted by her tenants and employe's, worked with a will to make the fite a snecess, with the result that the two days' takings amounted to nearly £90, a very good sum, considering that we live in such a quiet part of the country, and at a considerable distance from any town or railway station. It is to be hoped, now the gardens have been used in this way, that we may have an annual fite day for the good of some charitable object, and among the first we hope to help some of those which are intended for the benefit of gardeners. We may say for the information of those who may be inclined to open their grounds to the public, but are deterred by the fear of having their trees, shrubs, and plants injured, that during the two days of our fite we had not a single twig or anything in any way damaged. J. A.

RED-SPIDER AND XL-ALL VAPORISER. — Last year I resolved to use the XL-All vaporiser on some frames of Princess of Wales Violets, containing 160 cubic feet of space, very badly infested with redspider, and I started with the prescribed quantity, funigating the frames ten nights in succession, and affording a stronger dose each night: the last night I had both small cups full of the liquid. It did no harm to the growth of the plants, and only checked the red-spider, not killing it. On Vines, the action of the fumes should be much more effective than on Violets in frames, but I have been unable to make the trial. This year I am using Vermorel's Eclair Knapsack Spraying Pump, using XL-All Liquid Insecticide with good results on Rose-bushes infested with green-fly and caterpillars; and of double strength for red-spider on Violets out-of-doors, but I am unable as yet to speak of its effect on the latter. Like your correspondent in a recent issue of the Gardeners' Chronicle, I am a firm believer in the efficacy of the XL-All Vaporiser, and find it to be one-half cheaper than some other insecticides, and as easily applied. R. Dunlop, Trubboch, Ayrshare, N.B.

HYBRID TEA ROSES.—In the issue of the Gard. Chron. for July 25, in the third sentence, "more is printed by mistake instead of "most; while the fourth paragraph should read as follows, where the error which it embodies (for which I may possibly be responsible) has been corrected for the benefit of my readers :- "Sometimes the law of variation is in favour of a Rose. Souvenir d'un Ami, for example, is surpassed by Souvenir de S. A. Prince, though the former is one of the finest of the older Teas; and in the adjoining department of hybrid Tea Roses, White Lady similarly eclipses, unless indeed in fulness, her august parent, Lady Mary Fitzwilliam." august parent, Lady Mary Fitzwilliam. Last year an almost pure white variation from an Irish Tea Rose, Mrs. James Wilson, originated in my garden. I have named this beautiful new variety Marguerite, to commemorate the heroines of Goethe, Gounod, and Matthew Arnold. David R. Williamson.

RED PANSIES.—If the bright red fancy Pansies Messrs. Dobbie & Co., of Rothesay and Orpington, have selected, and out of which they think they have secured a valuable bedding variety, prove of good and durable constitution, persistent in blooming, and do not seed too freely, then they are likely to become formidable rivals to the Violas for bedding purposes, as the colour is bright, and highly attractive. very much a question of persistency and non-seeding. When a plant begins to boar seed somewhat freely, it is always at the expense of blossom production. The capacity on the part of the fancy Pansy for standing heat and drought has been demonstrated in several places this season, and conspicuously on the promenade at Eastbourne. On one of the hottest and driest days of the present year (about the middle of June), these Pansies were delightful, and showed no sign of giving out. Many of the Violas prove very per-sistent, largely because they produce but few seedpods; and there are a few varieties which go down quickly before heat and drought. R. D.

EARLY PEARS.—Some writers in the gardening press are raising the cry that more varieties of summer Pears are demanded by the public. I should say that this is simply nonsense. The consumer may want more Pears on the market and in the garden,

but not better ones than we have already. A summer Pear is like a summer Strawberry, a fruit for the season, not for storing or keeping. And we are not so very fastidious, after all, about high flavour, but we do like juiciness, sweetness, tenderness of flesh, and good appearance, and these very desirable points are present in all or most of our common early Pears. In addition to those name I in a previous note, I might name Bon Chrétien, Clapp's Favourite. Souvenir du Congrès, and others of Mr. Rivers' raising. Bearre Hardy.

EARLY PEACHES.-On the last day of June we commenced gathering ripe fruits of the Alexander Peach from a large tree on a south-west wall, and close to two ranges of hothouses, fruits of Waterloo being ripe a few days later on a tree a few yards distant on the same aspect. Excellent fruits have been gathered three times a week for the London house from trees of Alexander on south and south-east walls. Amsden June on a south wall, and Hale's Early (on a south-east wall). This supply of ripe Peaches that are of fine flavour, highly coloured and of good size, can be secured throughout the month of July, during a summer like the present, and by planting Crawford's Early, Dr. Hogg, Early Grosse Mignonne. Dymond, Crimson Galande, Noblesse, Royal George, Violette Hative, Walburton Admirable, and Sea Eagle, the latter yielding a fine crop, fruits may be obtained well into the month of October, that is as late as Peaches from outdoors are good eating. If several houses were planted with trees of Alexander, Waterloo, Amsden June, and Hale's Early, no difficulty would be experienced under skilful management in maintaining a good supply of Feaches from the beginning or middle of April on to the middle or end of October. Trees of Early Rivers and Lord Napier Nectarines planted each in a house by itself or together, would furnish early fruits, the latter succeeding the former, which is I consider, the earliest and the best and handsomest Nectarine in cultivation. H. W. Ward, Longford Castle, Salesbury.

PRUNUS PISSARDI.—We have a large hedge of this purple Plum, which is bearing a crop of Plums ripe now (July 27), and the fruit is only moderately good in flavour, but for cooking it is good: moreover, it is much the earliest we have. We are 600 feet above sea-level, and 6 miles west of Barmingham, not therefore in an early locality. In the blooming season the hedge was quite a mass of white blossom, and the young shoots of a red colour just peeping out of the mass, gave life to it, and made it a veritable fairy scene. I know of no fruit tree to equal in beauty this Plum when in bloom. The hedge is about 18 feet high, and it has never flowered so profusely as this year. When one considers the value of the foliage for decorative work, its beauty among shrubs, its adaptability to shearing or pruning, and lastly its economic usefulness in exposed situations, the plant is a most desirable one to the nurseryman, gardener, or amateur. J. Pope.

PHLOXES AND THE DROUGHT.—Few plants show the effects of the drought sooner than shrubby Phloxes when the soil gets dry. They are just now in flower, and as they are valuable decorative agents in the flower garden, some effort should be made to heighten and prolong their beauty while the dry weather lasts. Mr. E. beckett has lines of them in his mixed borders at Aldenham House, and he has taken the precaution of mulching them with strong manure, and well waters the plants also; consequently, despite the dry atmosphere, they are producing fine heads of bloom. Anything in the way of a mulch would be helpful, but there is nothing like some good moist manure. R. D.

SPRING-FLOWERING VIOLAS AND PANSIES.—
There is urgent need of a group of Violas which will bloom with the Aubrietia and Irinnrose. Bulbs are not so largely employed for the decoration of the flower-garden in the spring, and especially so in our London parks; and good early blooming carpetplants are greatly needed. The Viola, when as a dwarf, compact, somewhat creeping, free-branching habit, is well adapted for this work, but it needs to be early-flowering also. I robably our earliest Viola to flower in spring is the yellow Bullion, and it may be taken as a type of what is required, but it needs adding to of such as white, lavender, blue, rose, erimson, &c., with any combinations of colours which can be made effective. If anyone would set themselves to work to develop a race of early spring-flowering Violas, they would be doing good service to gardeners. What is required is, that they be well in

bloom by the time the bulbs are in flower, and then take up the floral succession until the time for planting the summer occupants come round; they would Violas will move at almost any season of the year, and they can be taken up with the bulbs, and planted out in a nursery-bed; and if the young side-growths, which had put forth roots, were taken off and planted out in prepared ground, to grow into sizes, they would be found highly serviceable for carpet-work, being planted out in October with the bulbs. The plants should not be allowed to flower during the summer, but encouraged to make a tufted growth of flowering shoots. Cuttings rooted in April and May, if planted ont in the same manner, and similarly treated, would be equilly useful. Hardihood, and a capacity to stand rough winters, are needed, and a close, compact growth would not lend much obstruction to the country winds, which frequently snap off the shoots of varieties of more spreading growth. But precocity in flowering is, of all things, most essential, and should be encouraged in every possible way. Au autumn and winter trial of Violas would be found instructive, as showing the earliest to bloom of those in cultivation. The plants should be planted where they are to flower not later than October, should be allowed a deep root-run in good soil, and be planted firmly in it. \vec{R} . D.

A HORTICULTURAL TOUR.

I have lately visited Metz, Nancy, and Luxembourg, and taken some notes at these various places which may be thought of interest. The Botanic Garden of Metz is at Montigny, and under the directorship of M. Varmont, who also has charge of the plantations in the town. These all give evidence of his ability and skill.

At Plantières, near Metz, the brothers Simon-Louis have large excellently-managed nurseries, under the care of M. Jouin and his two sous, and M. Martin. I noted here a Populus Eugenei planted in 1834, the birth-year of M. Léon Simon, the present proprietor : Halimodendron (Caragana) in bloom ; grafted Oaks, Quercus pedanculata filicifolia, foliis argenteomarginatis, and foliis atro-purpureis. Spiræa lævigata much resembles a Bupleurum, with flowers in panicles at the tip of the branches. I admired the fine foliage of Rhamnus Frangula var. asplenifolia. Acer circinatum vars. lutescens, pulveruleutum, platanoides, encullatum, laciniatum, and Reitenbachii, Psendo-platanus foliis atro-purpureis, and Simon-Louis Frères (with variegated leaves), and Woorlei were beautiful. Genista sibirica flore pleno is a dwarf shrub, with abundant yellow flowers in clusters.

I saw also numerous seedling Tulip-trees; Calophaca Wolgarica, a small shrub, with trailing branches covered with clusters of yellow flowers; Betula pendula nana: Caragana Gerardiana, with yellow blooms, and C. jubata, with white blossoms. Carrière's original Clematis nana was flowering here; the eurious Prunus tomentosa; Staphylea hybrida columbieri (1), flowering on the young wood; Lespedeza bicolor, a pretty hardy shrub, with rosy and red flowers; Potentilla davurica, white flowered; Ribes alpimun, yellow; R. nigrum foliis argenteo-variegatis, with leaves variogated with white; and R. nigrum foliis aureis, with yellow leaves. Other plants were Chamiecerasus (Lonicera) Alberti; altaica, Ledebourii, nummulariifolia, Standishii, and tatarica; Diervilla canadensis and splendens; Sarothamnus scoparius fol. var.; Nuttallia cerasiformis, Prunns californica, with hermaphrodite flowers and numerous fruits; masses of Tilia euchlora; Acer platanoides Reitenbachii, with leaves green above and purple below : A. dasycarpum lutescens, pulverulentum, platanoides eucullatum, laciniata, Reichsgraf von Puckler, Pseudo-platanus foliis atro-purpureis, Simon-Louis Freres, with spotted leaves; Ulmus vegeta, Fraxinus alba, foliis argenteo-marginatis, aucubæfolia nova, excelsior aurea, excelsior simplicifolia, juglandifolia, mandschurica, novæ anglicæ, sambucifolia erispa, serratifolia, and Veltheimi.

M. Sunon's nursery is divided into two parts by the road from Metz to Strasbourg. In the second division I noted Chestnuts, purple Beeches, American Oaks, Ulmus campestris umbraculifera, and the well-known U. campestris Berardi; a good collection of Salix. including S. cerisia pendula (?; Æsculus pyramidalis, and Italian Poplars. There were also choice representatives of many other species, which space will not permit me to enumerate.

When at Luxembourg, I visited the very large grounds occupied by MM. Soupert and Notting. Standard Roses are here a special feature, and much good work is done in the houses, which are numerous and extensive. At Limpertsberg attention is given which is not burdensome, but attended with much pleasure, interest, and satisfaction. In the third place, you know we hear from time to time, and we hear too truly, that while the populations of our towns increase rapidly with our general trade and industry, the population of the country—that is to say, of the rural districts—does rapidly, and in some parts of the country tend to diminish. Well, I am greatly opposed to artificial interference by law with the natural course of things, and I believe it is a good general rule to allow each person to judge for himself what their pursuits should be, and whether he shall

light and the air God as given us, just in the way He gave them. It will be all the better for this country the more we can maintain and increase the rural population of the land."

MANCHESTER ROYAL BOTANIC GARDEN NOTES.

THE VICTORIA REGIA has done uncommon'y this season in the tank in which it is growing—far too limited in size to give a chance to the enormous

FIG. 31.-HAWARDEN CASTLE, FLINTSHIRE, THE SEAT OF THE RIGHT HON. W. E. QLADSTONE.

to the cultivation of new varieties grafted, and to those which do not thrive in the open air, being not hardy, but valuable for their colouring and beauty.

Mention should also be made of Roses, here extensively cultivated, and including varieties notable for beauty, strength, and novelty. Ch. D: Bosschere.

HAWARDEN FLOWER SHOW.

On the occasion of this show, held in the park at Hawarden, near Chester (see fig. 31), on Bank Holiday, Mr. Gladstone made some remarks on the utility of flower shows, from which we extract the following - i. It is a good thing for us that such institutions should subsist. In the first place they bring us altogether upon a common and friendly footing; in the second place, such institutions are an encouragement to industry, and to a description of industry

follow them. At the same time, I earnestly desire the maintenance and increase of the rural population of this country, and I rejoice in all pursuits that tend towards that increase. Evidently these pursuits tend to maintain and increase the rural population of the country. I have read, even in the course of the last year, a very interesting work showing how many things there are that can be advantageously dooe in the country, and I rejoice in the exteusive discoveries of the kind; for, after all, while we are delighted to think how many advantages the iohabitants of towns enjoy now that they did not enjoy in former times, through the action of railways and from other causes, yet it is a blessed thing to live in the eye of Nature and in the clear light of day. I have been a townsmin most of my life, but I am a rural man—one of the countryfolk—now, and it is a great enjoyment to be free from the foul rivers and the masses of smoke and the darkness that overhang many of our great towns, and to enjoy the scenery that is around us, the

circular tray-like leaves, which are deeper in the rims than we ever recollect to have seen them. It began flowering on June 11, and has kept up a continuation since. It is really a noble botanic garden plant, and has for its associate the large and beautiful Nymphæa devoniana, with two of its pink-cupped flowers expanding at once. The house is ke₁t open, and the visitor has not "to do" the sweltering climate which the Royal Lily is invariably subjected to.

ALPINIA NUTANS.

This fine ornamental flowering plant is grown in one of the intermediate-houses, and to some purpose. Its great spikes tower up above the foliage to about 7 feet from the pot, and it has yielded twelve of those spikes during the season. It was figured in the Gardeners' Chronicle some months ago.

VANDA SHAVIS.

There is a fine lot of this sweet-scented Orchid in flower, some of the spikes having fourteen flowers, and scenting the atmosphere around. One named V. suavis Ainsworthii is remarkable for its vellowish ground, with a profusion of sienna spots, having more the outline of V. tricolor insignis, but makes a charming comparison to the white ground and multitudinouslyspotted suavis. They are growing much cooler than usual, and the change has operated immensely in their favour

HÆMANTHUS MAGNIFICUS.

This is the largest and best of the Hæmanthus with which we are acquainted, forming an umbel about a foot across, and more brilliant in its crowd of stamens than any of the puniceus order. It was imported direct from South Africa, and is a valuable decorative bulbous plant. J. A.

PEACHES AS OUT-DOOR STANDARDS.

Nor so many years ago it was the opinion of many persons that out-door Peach culture, even against south walls, could not be successfully practised in this country, except in a few highly-favoured localities in the extreme south. This idea was no doubt partly due to a cycle of somewhat cold and wet summers, and to the fact that cheap glasshouses had been responsible for their extended cultivation under glass. Nevertheless, in many gardens during this period of time, Peaches were cultivated outside very successfully, one notable instance being at Ditton Park, near Slough, where for many years, under the late Mr. Linday's management, the cultivation of outdoor Peaches had been, for the least a quarter of a century, most successfully practised. This was in the valley of the Thames, where the atmosphere is unusually moist.* My object, however, in penning this note is to advocate the planting of Peaches and Nectarines as standard trees in the open air, as I firmly believe that success is quite certain in all midland and southern counties of England. Since the introduction of the early ripening American Peaches, of which Alexander and Waterloo are notable examples, Pcach growing has been, so to speak, revolutionized, as both the varieties mentioned, ripen at least six weeks before Royal George, an old standard variety, at one time considered an early Peach, this was before the advent of Mr. Rivers' Early Louise and some others that never seemed quite hardy enough for general cultivation outdoors. During the past few weeks visitors to the Royal Nursery, Slough, might have seen numbers of standard Peach trees in the open ground of the nursery adjoining the Great Western Railway loaded with ripe fruits. On a tree of moderate size I counted over three dozen, and from the various trees consisting chiefly of Alexander, Waterloo and Hale's Early, some hundreds had previously been gathered, well - coloured, juicy, and goodflavoured fruits, such as would find a ready sale, and form no mean addition to the dessert. Gathering commenced from these standard trees, Mr. Turner informed me, about the middle of July, and when I saw them on the 23rd, many of the trees were cleared of fruits; a chance one taken as an average for size measured just upon 8 inches in circumference, and this in a dry season and without any artificial watering or mulching whatever. This is not an exceptional year at Slough, as fruits have been gathered from these trees for the past three years at the least, and if in a good year as regards summer temperature, standard Peaches will ripen in July, surely in any ordinary summer they may be relied upon to ripen in August or September. Another point which may be in favour of these American Peaches is their somewhat backwardness in flowering. Taking Royal George as a standard, they are about ten days later when grown together than this variety in coming into bloom; but between the setting and ripening they make a clear gain of about six weeks. A great part of the covering-up afforded to Peach-

trees on walls during flowering-time is useless, and in some instances I think it does more harm than good.

Standard Peach-trees might also be utilised for planting in the pleasure-ground and shrubbery borders, where the soil is fairly good and retentive, being very ornamental while in bloom, the large flowering varieties equalling in this respect the Almond, and they would form a succession to these. A tree standing in a shrubbery, and carrying a good crop of highly-coloured fruits, would certainly be both ornamental and useful. A start may be made in planting, without incurring much expense, as maidens, dwarfs and standards may be purchased at a small cost, and these in a year or two form good heads. As for cultural details, little would be required heyond some disbudding, and getting the tree into shape during the earlier years of growth. and afterwards keeping the branches sufficiently open and thin, to admit sun and air.

Of varieties, Waterloo, Alexander, and Hale's Early may be relied upon to perfect fruits grown in this way in an ordinary season; while Dymond and Crimson Galande, and Lord Napier Nectarine, may be given a trial as a meaus of forming a succession.

HOLLAND,

THE STATE HORTICULTURAL SCHOOL.

MR. PLEMFER VAN BALEN, Curator of the University Botanic Garden at Amsterdam, and Mr. A. C. Ide, Director of the Fredericksoord Horticultural School. have been appointed teachers at the new State Horticultural School at Wageningen, under the direction of Dr. Cattie. Their successors are not yet nominated.

University Botanic Gardens.

In consequence of the resignation of Professor Oudemans and of Professor Rauwenhoff, there will be a few changes in the management of the Dutch Botanic Gardens, which henceforward will be conducted as follows :

Amsterdam,-Director, Professor Hugo de Vries. Leiden.-Director, Professor Suringar; Curator, H. Witte.

Groningen .- Director, Professor Moll; Curator, A.

Utrecht. - Director, Professor Went : Curator, J. K. Budde.

"FLORILEGIUM HARLEMENSE,"

The first fascicle of this standard work now being ready, a few notes on it may be welcome. Reference to the publication has already been made in the tiardeners' Chronicle. The plates, which exclusively represent bulbous plants from the Haarlem nurseries, were selected by the growers themselves byla majority of votes, the voters being members of the Royal Eulb Cultivation Society of Haarlem. The results of this plebiscite have been recently published in this paper. The first fascicle contains coloured plates and descriptions of Hyacinth La Grandesse (single white), single early Tulips Keizerskroon, Pottebakker, white Proservine and Vermilion Brilliant, and single trumpet Daffodds maximus, John Horsfield, and Silver-trumpet. The plates are accurately drawn and painted in watercolours, and well reproduced by Mr. Goffart (successor to Mr. Severeyns) of Brussels. The descriptions are in Dutch, English, German, and French, and the history of each variety is given as far as is possible. Many of the Dutch hulbs are very old, and unfortunately little is known about their origin and earliest history. The notes given on Narcissus maximus and the Silvertrumpet (Moschatus albicans), are very interesting and complete. The plates give a good idea of the varieties figured, especially of the Hyacinth and Daffodils. These are shown at their best, without the least exaggeration. Correspondent.

"KNOWLEDGE."-The August number contains, among other articles, papers on Hygroscopic seeds, and the Lime-tree, in which the principal facts are set forth simply and clearly. The article on Seals makes one shudder. The anti-vivisectionists would do well to turn their attention to the wholesale atrocities perpetrated by the scalers.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

JULY 28.-Present: Dr. M. T. Masters (in the Chair)

Primula with Myxogastres.-The following report was received from Kew with reference to the specimen exhibited at the last meeting :- "The organism is one of the Myxogastres Physarum gyrosum, Rost). It is not a parasite, and will do no injury unless it occurs in immense quantity, when it might he washed away by spreading. The early or plasmodium condition developes in darkness, and finally creeps up anything, organic or inorganic, for the purpose of forming its spores in a position where they may be readily diffused at maturity by wind and rain."

Pelargoniums Treated with Salts.- Notes were compared as to the conditions of the three sets of white Pelargoniums under experiment. Mr. Henslow said that in his case all the plants treated with the salts, though perfectly vigorous, had failed up to the present time to develop any flowers, the trusses perishing when about half an inch long, but that they were now beginning to form well. On the other hand, the two plants not treated with salts had flewered well the whole time. Mr. Wilks and Dr. Russell, both alike, had all the plants flowering; but up to the present time there had been no offset upon the blossoms.

Devilar with Cones .- Mr. Henslow recorded the somewhat unusual fact that one tree out of four, planted about forty years ago in his garden at Drayton Heuse, Ealing, had six cones upon it at the present time.

Tomotos, Discased .- Mr. Hillier, of Bariton, near Petersfield, forwarded some Tomatos which failed to colour properly at the base. They were forwarded to Kew for examination. whence the following report has been received:—"The fruit has ripened unevenly, due probably to a disturbance in some part of the plant, presumably the root, which, however, is not torthcoming for examination."

Grapes, Blighted. - Mr. Messenger, of Woolverstone Gardens. Ipswich, sent a bunch showing some affection to the stalk and leaves. It was sent to Chiswick for investigation.

CHESTERFIELD FLORAL AND HOR-TICULTURAL.

July 29.-Amhlated with the National Rose Society, and run in connection with the Technical Education Committee of the Chesterfield Town Council, which authority practically makes all the arrangements, this show is becoming one of the most important in the Peak district of Derbyshire, notwithstanding the eminence obtained by Clay Cross and Tibshelf before it was instituted. The exhibition on Wednesday in the pretty Queen's Park, which is at all times a credit to the florists of the metropolis of the Derbyshire coal-field for the mass of bloom and foliage banking the many walks, was a highly creditable one, no fewer than three large marquees being required for the exhibits, which were all round superior to last year. It was regretable though that a little hitch took place with the judgesover the groups, which were equal to anything seen in the county for effect, even if the plants were not all equally valuable. It occurred in the open class for groups covering 150 feet, in which Mr. T. J. NELSON, of Ashgate, was awarded premier bonours for a charmingly arranged collection of flowering and foliage plants, every one of which was in its place, and assisting in a harmonious whole. (There appears to have been considerable feeling displayed, but into that or the merits of the case we cannot enter. ED.]

Groups to cover 80 feet produced a capital competition, Mr S. Polkinghorne, gr. to Mes. EDMUND BARNES, of Ashgate, was placed at the top. In the centre he had a specimen of a Phenix, and the surrounding Crotons and Ferns were prettily arranged, the finish being tasteful Mr. H Horsnall, gr to Mr. J. E. CLAYTON, of Thornfield Hall, Chesterfield, was awarded 2nd. Mr. D. Thornfield Hall, Chesterfield, was awarded 2nd. Mr. D. Money, gr. at Rose Hill, and Mr. H. Mottershaw, gr. at Tapton Hall, Derbyshire, were respectively 3rd and 4th.

The Ferns were a superb lot, Mr. S. Polkinghorne, Mr. T. J. Nelson, and Mr. W. Haslam, dividing the honours.

Roses were quite a feature, and the hlooms remarkably

good, especially those of the prize winners. Messrs, Merry weverher & Soxs, Southwell, secured the 1st prizes for forty-eight distinct varieties, for the twenty-four varie-ties, and t'e twenty-four Teas or Noisettes; Messrs. ties, and the twenty-four Teas or Noisettes; Messrs. Mack & Sos of Catterick, Yorkshire, were 2nd for forty-eight varieties and twenty-four varieties; and Mr. H. V. Machin, of Gatesford Hill, Worksop, 3rd for forty-eight varieties and twenty-four varieties; and 2nd for twenty-four Teas or Noisettes; Messrs. Proctor & Sons, of Chesterfield, being 4th for forty-eight.

the local Rose-class for nine varieties, Mr. F. VICKERS of Wingerworth, was 1st; Mr. W. Haslam, of Hardstoft, 2nd; and Mr. E. Jenkinson, of Stubbin Court, 2nd. This was a highly creditable class.

Messrs. Proctor & Son easily maintained the lead for bridal bouquets.

The ball-room bouquets were handsome, Messrs, Johnson & WHELLER here taking the lead.

The cut flowers were excellent, considering the dryness of

^{*} This Peach-wall was figured in the Gardeners' Chromich, December I, 1883, p. 685.

the season; and in the hardy and half-hardy, Messrs. PROCTOR & SON produced an interesting specimen which is semewhat unique.

August 8, 1896.1

The fruits, consisting of Nectarines, Peaches, and Tomatos, were a very fine lot, and in the last named the competition was very keen.

There were two other sections for amateurs and cottagers. and much improvement to the earlier shows une or the society was witnessed. The entries were more than trebled, but this is not to be wondered at, considering the allot ment and other gardens which have been laid out in large numbers in the district during the past two years Nowhere is floriculture and horticulture more encouraged, the Mayor (Councillor A. C. Locket being a great enthusiast. The judges for these sections were Mr. Luck-hurst, lecturer to the Derbyshire County Council: Mr. W. M. Hewitt, Chesterfield; Mr. Horsmall, gr at Thornfield House; and Mr. S. Polkinghorne, gr. to Mrs. E. Barnes, It should be mentioned that Messrs, Procrom & Sons were

awarded a Certificate for some lovely varieties of Carnations

BRIDGWATER HORTICULTURAL.

JULY 30. After having been discontinued for several years, a flower show was held on Thursday at Bridgwater, under the auspices of a newly-formed horticultural society, of which Mr. E. J. Stanley, M.P., accepted the presidency, The Mayor (Alderman H W Pollard) was the vice-president, and Mr. John Gray, manager of the Wilts and Dorset Bank, proved an indefatigable hon-secretary. A large number of entries were obtained, and the show proved an excellent one, and was well patronised. It was held in the grounds of Mr. Walters, adjoining the Taunton road, and a special attraction was the engagement of the Royal Marine band from Plymouth.

The chief prize winners were: for plants in pots Miss Sanderson, Ofterhampton and Mr. S. H. Bailey, Glastonbury; Ferns--Mr. F. L. Carslake, Bridgewater; zonal Pelargoniums--Mr. F. J. Parsons; Begonias Mr. S. Lovibond, Bridge water; Cut Flowers--Mr. H. Corder and Messrs, Jarman & -Mr S. P Budd, Bath, Zimnias Mr Co., Chard; Tea Roses H. Corder; Phloxes-Mr. W Perryman; and Sweet Peas Messrs, Jarman & Co.; Groups Mr. F. L. Carslake; Herbaccous Perennials Lieut, Colonel Buthum, Bridgewater.

FRUIT.

The best collection was shown by Lieut–Colonel E. C. Λ Sandford; Colonel Mount Batten half the best black and white Grapes; Lieut-Colonel Sandford had the finest Peaches, and Colonel Mount Batten the finest Nectarines and Plums; Dessert Apples were well shown by Lieut, Colonel Sandford and Mr. Corder Vegetables and Roots were Vegetables and Roots were excellent for the season, and Cottagers' productions praiseworthy.

NEWPORT AND COUNTY HORTICULTURAL.

JULY 30 .- After a lapse of ten years, a show, which happily proved to be a very good one, was held at Newport by the above society, for which the county have to thank an energetic secretary and committee. Excellent arrangements were made for the exhibits in large tents, placed in King's Hill Fields. The day was fine, and everything connected with the exhibition was successfully carried out. A R RICHARDS, Esq , the Mayor of Newport, accompanied with the Mayoress, formally opened the show

PLANTS OPEN CLASSES

Ogden, Esq., There were numerous miscellaneous noncompetitive exhibits considerable merit, including one of Plants, Cut Flowers, &c from Messes, Cliff in & Son, of Munchester, and one also from Mr. Basham of Bassalleg.—A Corresponding.

THE NATIONAL CARNATION AND PICOTEE

(Northern Division.)

August 1 -The mmid show of the above Society took idace in the Royal Bot mical Girdens, Manchester, on the above date. It was timed to take place a week later, but what with the advanced character of the season, and the Chester show, the Committee decided to intedate it. There was the usual brisk competition for Carnations and Picotees, and the flowers generally were above the average.

Mr. T. Lorg, Todmorden, took 1st prize for twelve Carna tions, all dissimilar, having a very even stand of the following blooms: Robt Houtgrave, Thaddens, Crist & Gill, Bruce Findlay, a good searlet bizarre seedling; Admiral Carzon, J. D. Hextall, Mrs. Murr. Gordon Lewis, extra fine; George and Edith, Annie. Mrs. Jab. Edwards, Mostyn, J. W. BENTLEY, Stakehill, J. Brockferding, Gro. Thornley, and HEXEY GEORGE followed: the bary blooms of Thornley, and HENRY GEGGIE followed; the best blooms among them were Sarah Pryne, Ellis Henwood, and Evan Edwards

For twelve Picotees, all dissimilar, Mr. WM. KENYON, Bury, was 1st with Zerlina, Nellie, Little Phil, Ethel, Esther, Mrs. Gorton, Mrs. Wilson, and Henry Kenyon. Messrs. T. Lord, F. Shaw, Mostyn, Edwards, H. Geogle, and C. F. Therston followed; the best blooms among the lot were Muriel, Morna, Lady Louisa, and Thos. Williams.

For six Carnations, dissimilar, 1st, Mr. T. Berwick, Middleton, who had, among others, excellent blooms of Sports-

man and Dolly Varden. Messrs. Shaw, Chorley, Writtaker, and Thurston also had good stands.

For six Preotees, dissimilar, Mr. C. Hebden was 1st with very good Esther, Mrs. Payne, Nellie, Lady Louisa, and Mrs. Mr. Ec. KENYON had Little Phil and Zerlina, very good; and Mr. Beswick had Mrs. Gorton, fair.

For twelve selfs, there was a fine competition, and the flowers were large and well-grown and showy. Mr. T. Lord had Germania, Scarlet Queen, Ruby, the white Mrs. Muir. Uncle Fom, and a bright scarlet seedling. Messrs, EDWARDS, WM KENYON, and J. W. BENTLEY had all good stands of flowers.

For six selfs, Mr Brockhurst took 1st, chiefly with seedlings and Germania. E. Shaw, Edward Kenyon, and 1). Walker, Kilmarnock, followed.
For twelve fancy Carnations and Picotees, Mr. T. Lord had

particularly good Romulus, Auriel Rose, Mrs. Scott Banks, and Soudan Messrs. EDWARDS and C. F. THURSTON followed Mr. D. WALKUR, Kila irnock, had a very good six

For the best crumson bizarre, Mr. Lond was 1st with Master Fred, among scores of other competitors; the same grower being 1st for a scarlet bizarre with Robt. Houlgrave, and also for a jonk and purple bizarre with Bruce Findlay. Mr. II. Greate, Bury, was 1st with a searlet flake, Tom Lord. J. Beswick was 1st for rose flake with Dolly Varden, and Mr. Lors for purple tlake with Gordon Lewis,
For the best heavy-edged Picotee, Mr. Loro was 1st with

Morna, light edged with Mrs. Gorton, also for heavy-edged purple with Amy Robsart; also for light-edged purple with sther; also for heavy-edged scarlet or rose with Edith Dembrun. For light-edged rose, Mr Keyvox was 1st with

For the premier Carnation in the show, Mr. LORD was 1st with G orden Lewis, a beautiful bloom; and for the premier Preedee, Mr. Edward Kenyon was 1st with Harry Kenyon with fine petals slightly pink-edged.

with fine pethis siigntry pink-eageo.

First class Certificates were awarded to scarlet bizarie
Evan Edwards, one of the best in exhibit, only rather small, from Mr. Elewants, also to the same grower for Picotee Eveline, a finely built white ground with a soft pink edging Mr. Brocktineast, Mostyn, seemed a First-class Certificate tor Etna, i dcep maroon shaded scarlet after the way of Maneumin - Mr. H. Gegett, Bury, secured a similar award for a white border Carnation named Mrs. Howard

FROME.

Atoust 3 - Under the suspices of the Lord Lieutenant of the County (the EARL OF COLK) and the MARQUIS OF BATH, the Committee of the Frome flower-showheld a most successful exhibition of plants, cut flowers, fruits, and vegetables on the above-mentioned date.

Groups of miscellaneous plants, arranged for effect, were Frome, being a good lst; Mr. 8. White, gr. to J. Bally, Esq. Frome, being a good lst; Mr. 8. White, gr. to J. D. KSIGH, Esq. had the best hilf dozen specimen Fuchsias out of three good lsts shown. Mr. Paynam, gr. to Mrs. Gollesman, Trowbridge, had the best six stove and greenhouse foliage plants. And Mr George Tucker, gr. o. ..., LULLE, was 1st for twelve exetic Ferns, distinct, with a feesh, even lot. Mr. E. Hyll, Bath, had the piece of Cycis revoluta. Two large groups of capitally-grown and well arranged decorative plants, not for comprinting, were put up by Mr. Trollope, gr. to the Mangers of Barn, Longleat, and Mr. Young, gr to the EARL OF CORK, Marston; and an interesting collection Cacti, not for competition, was exhibited by Mr. E. R. II CHAPMAN.

Fruit was shown fairly well. Mr. SIRUGGNELL, Roode Fruit was snown tartis wen, and consider, kees Ashton, Trowbridge, had the best collection of six kinds, showing nice brightly coloured pieces of Museat of Alexandria, good Black Humburgh, Brown Turkey Figs, Dymond Peach, Stanwick Necturine, and Sutton's Al Melon. Mr. R. J. Pulleties had the best two bunches of Black Grapes, showing runtities hat the best two bunches of Black Grapes, showing medium sized bunches of Midresheld Court and Black Humburgh, beautifully endoured Mr. Strucgorell, was a good list in the corresponding class for two Whites, with well-coloured Muscat of Alexandria. Mr. Pynnu was list for Peaches, showing a nice dish of Royal George; and a good dish of Lord Napier Nectarine secured a like honour for the same exhibitor.

VEGETABLES

Were shown well for the season. Mr. James Hall was successful in securing 1st prize (Messrs, Sutton & Sons') in the class for six kinds, with excellent produce, well set up; Mr. G. Garaway taking Messrs. Webb & Sons' 1st prize for a like number of kinds, fine in every respect. Cucumbers, Tomitos, &c. were also shown well.

ROYAL SCOTTISH ARBORICULTURAL

Areces 3 - This society held a general meeting on the above date at 2 o'clock p.m., in the Lecture Hall at the Royal Botanic Gurden, Edinburgh, permission having been obtained from the Regius Keeper. Mr R. (MUNRO FLEorson, M.P., President, who had intended to be present

wrote apologising for his absence, he having been detained in the House of Commons in connection with the Rating Bill Mr D. F. MACKENZIE, Mortonhall, occupied the chair The council meeting was held at 1 o'clock, and five life members and twenty-nine annual subscribers were elected.

The number of essays sent in were this year in excess of 1895. Thirteen having this year to be judge I by the council, Threem naving this year to be judget by the collicit, as against six of last year. Silver medals were gained by the following. Messis, James Harbie, Mortonball Gardens, Edinburgh, Alexander Mueray, Forester, Murthly; R. Stewart, M. Dougall, Royal Botanic Gardens, Edinburgh; Andrew Stater, Peebles; G. Caddell, late of Her Majesty's Indian Forestry Department; and Alex Magrae. Assistant Forester, Market Drayton. Bronze melds were awarded to Messrs, J. Gillefiel, Lockton Lodge, Perthshire; and J. F. Inglis, Forester, Kelly Estate, Wennyss Bry. A Motion that the following offices be created in the society, and that the members undermentioned by elected for the your, was brought forward: "Consulting Bitantist Professor, J. B. Balfor R. F.R.S. Consulting Chemist, Dr. A. P. Attens, Consulting Entomologist, R. Stewert MacDougall, Esq., B.S.; Consulting Gologist, Dr. Affler & Consulting Meteorologist, M. Mossman; and Dr. Somerville as Consulting Cryptogamist ANDREW SI VIER, Peebles : G CADDELL, late of Her Majesty's sulting Cryptogamist

A Motion was also brought forward and remitted to the A Motion was also brought forward and remotes to the council to arrange for the 1807 exercision, being to Ireland. The papers read before the society consisted of one from Di. Alaxii Schwaffrach, Professor of Forestry, Eberswalde, Prussia, on "The Importance of Bensty in Sylviculture," which give in my valuable hints and rules to those engaged in forestry. Mr. A. C. Forens, Word Manager, Bowood, Wilts, also gave a paper, entitled "Is British For stry Progressive"

ST. NEOT'S HORTICULTURAL.

AUGU I 3.-This was the thirty-second exhibation of this popular Society, and it is something to its credit that, in a purely agricultural district, an exhibition should be manutained so long; but it wisely enters for the country people, by including in its schedule of prizes all kinds of agricultural produce, while there is a section for market gurdeners adsopoultry, pigeons, rabbits, caged birds, and other subjects. The show took place, as usual, in Priory Park, the residence of G. FYDELL ROWLEY, Esq. Another circumstance worthy of mention is, that this exhibition celebrated the twintyhist year of service, as working secretary, of Mr. Whilia RATIOHELONS, the manager of Messis. Wood & Jogean's branch nursery at 8t Neat's, to whose exertions so much of the success of the Society is due, Owing to the recent death of one of the principal exhibitors. the show was deprived of several collections of plants, the presence of which has always added material interest to the show; but though, owing to this rad other curses, t'e classes were not so well filled a usual, there was a manife-t advance in quality. The most successful exhibitor was Mr T bookie, gr. to Λ , J. Thousant μ , Esq., Diddington Hall, and formerly of Windsor.

A few classes are open to all conners, but on this occasion they brought only two exhibits, Messus. Whom & INGLAM, mussrymen, Huntingdon, being 1st with twenty four Roses. They were also placed list with twenty-four fine bunches of

They were use piacear 1st with covering out, bardy, herbaccons, and bullious flowers.

In the classes from which nurserymen are excluded, Mr., W. G. and Japan. in the classes from which nurserymen are excluded, Mr. T. Loe six had the best two lve cut Roses. Mr. W. Giscolome, gr. to 6, O. Ngwrox, Esq. was 2nd Mr. R. Burata, St. Neots, had the best twelve Diblias, Mr. Loekte taking the horizon of the first twelve Robert twelve Zinni edg. inspections of the locket was 1st with twelve Zinni edg. inspections. excellent for the season, also with twelve bunches of stove and green-house ent flowers, staging in capital condition Allmanda, Glovinias, Globe Amaranthus, Steptocarpus, Cleroden ron fallov, Ivota, &c. Trusses of zonal Pelargo niums were very good, Mr. Lockinagain taking the 1st praze, Dr. E. J. Choss, St. N. offs, being a close 2nd. Mr. W. Last, gr. to F. Dav, Esq., 8t. Neoffs, was 1st with twelve bunches of bordy idants

Some capital specimen Fuchsits gained the 1st prizes for Mr. Lockie, chief among them, Rose of Ustille Improved, Mr. Lockir, chief among them, Rose of Unstitle Improved, a very fine exhibition and decontive variety. Mr. A. Watstassos had the best six plants in bloom, they included a fine piece of Neriom Ole index, and Plumbog coapensis, &c. Colons were shown in finely-grown and coloured plants, Mr. Lockii. were shown in finely-grown and coloured plants, Mr. Lockit taking the 1st puize, Mr. Lyki being a close 2nd. Mr. Lockit, taking the 1st puize, Mr. Lyki being a close 2nd. Mr. Lockit, was also 1st with half a dozen finely grown, and bloomed and Pelargoniums; he led the best specimen flowering plant in an excellent piece of Statice profiles, and he was also list with a specimen foliaged plant, leving a well developed example of Alocisia cuprea (metallicu). Mr. Subilla S. Wilson, was also with a group layer lateral tree per second speciments.

KINSON was 2nd with a green-levved Dracara, Tuberons-rooted Begonias were represented by admirably grown and bloomed plants from Mr. Lockie; Mr. A. W. ATKINSON was 2nd. The former was the only exhibitor of a group arranged for effect, having a very pleasing one indeed. Stove and greenhouse Ferns and plants for table decoration

were both good features. There was a small but select display of fourt, the best collection of eight dishes caming from Mr. Cirter, gr. to Cupt

W. H. De verman, Wareshy Park, Sandy.

M. Leon, a took the 1st prize for ten dishes of vegetables, patting up a perfect collection

A group of excellent Cauries from Messrs, Worde & Ixok vil

were highly commended

NORTHAMPTON HORTICULTURAL.

Acc. 3, 4 -This society held its annual exhibition and fite on the above dates The competition was keen and the productions very good. Considering the season, cut flowers were shown very satisfactorily. Plants were very fine, and groups also. The arrangements of the show were in the hands of Mr. W. B. TROUF and an efficient committee, who discharged their duties in an exemplary manner

In the class for twelve specimen plants, Mr. J CYPHEE. Queen's Nurseries, Cheltenham, was placed 1st. He had splendil specimens of Kentia Belmoreana, Cycas revoluta, Kentia Forsteriana, t'roton angustifolius (extra), Phoenocoma prolifera, Dipladenia hybrida, Croton Queen Victoria, Statice profins, Allamanda gramilifora, Ixora salicifolia, and C eton Sunset, which was beautifully coloured. Mr. Fixen, Coven-try, was a fairly good and, and included good specimen rotons, Erica Lindleyana, Statice profusa, &c. Mr. VAUSE. Learnington, was 3rd

For six stove or greenhouse plants, three in bloom and For six stove or greenhouse peaks, three out of bloom, Sir H. Wake (gr., Mr. Knightley), was 1st, Stephanotis, 1vy leaved Pelargonium, Souvenir de Charles Stephanous, try leaved reargonium, souvenir de charles Turner, Croton angustifolius, and Latania borbonica were in cluded. Mr. Copson, gr. to Mrs. P. Pinters, Collington Grange, was 2nd, and he had a very good plant of Ivera Williamsii, Mr Innes, gr to Mr W. H. FOSTEE, of Spratton Grange, was 3rd

Some splendid Ferns were exhibited, and the 1st prize went to Mr. Pence, gr to L. Loder, Esq., Hove House. Mr. Corson, Collington, was a good 2nd.

Colenses were very fine, Mr. Corson being 1st, and Mr. Dorey, gr. to Mr. Simison, Broom Hill, Spritten, 2nd For six Boulde Begonias Mr KNEGHTLEN was 1st, and showed some rapital seedlings. Mr HOLLAND, 2nd. Mr KNEGHTLEN was again 1st for Single Begonias, Mr Courson 2nd. Fuchsias from Mr. KNEGHLIAY were good. Mr. BEARD and Mr. LOFER were 20d and 3rd respectively. Some good and 3rd respectively. Some good and 3rd relations were studed by Mr. Dorev and Mr. Corson.

For Table Plants, Mr. Pearce, Mr. Cott. and Mrs. HAMS were the successful exhibitors.

Cockse only were not very good; the best came from Mr PEARCE, followed by Mr. Corson and Mr. Kempshall, gr. to Sir C. E. Isu vu. Bt., Lumport Hall.

GROUPS

For a group to cover a space 20 feet by 12 feet. Mr. Cyfrifin was again placed 1st, with a beautifully arranged group with a centrepiece of Kentia Belmoreana, and smaller groups arranged around it of splendidly coloured Crotons, Cannas, Bumbusas, Hamea eleguns, Tuberoses, Drivenas, Asparagus Bonbusas, Homea elegans, Theoroses, to recease, a spurigus plumosus and deflexus, and the corners and cravices filled with small plants of Calodium argyrites $\mathcal{K}_{\mathbb{C}}$, and Moss Altogether the group was a credit to the firm $-Mr(\Lambda A) = \mathcal{K}_{\mathbb{C}}$. Learnington, was 2nd. The chief feature of his group was arches covered with Cork and Moss. In the centre of the arches was a plant of Phonix rupicola, and around the arches and in the corners were flowering and foliage plants of Coos, Liliums, Crobons, Hydrangers, Loras, Enfalars, Orchals, &c. Mr. Pixen, Coventry, was fid.

ROSES (Open

considering the very dry season this popular flower was shown fairly well. In the open class Mr John Perkess was 1st for twenty four blooms, which included some good blooms lst for twenty tout (booms, when memory some good (booms of François Michelon and Ulrich Brunner); but the whole exhibit was very even in character. Messes Phony Prinkley, of Northampton, were 2nd with a fairly good exhibit; and Mr. W. Eyden, gr. to Symers Brugen, Lsq.,

OTHER CUT FLOWERS

For twenty-four Dahlias, Messrs, T. PERKINS were 1st, and they had a very strong collection.

For twelve Dublis, single blooms, Mr. Bivito was placed

Twelve tourches of Certus Dahlias brought only one competitor in Mr. Praeson, who was placed 1st.

TREET

In open class for a collection of eight varieties, M_1 -Cour, gr., Althorpe, was 1st with Queen Pine, Museat driv and Midresfield Court Grapes, Prince of Wides Peich, driv and Medresh et Court Grapes, Frince et wate. Feach, brown Turkey Fig. Countess Melon, Lord Narder Nectinins, Doycume. d'Et? Pears. Mr. Hayes, gr. to Manours on Northameron was not with good Musear of Alexandria, which were not quite ripe, and beautiful Necturines (8) inwick Elruget; other dishes were Peaches, Melon, Approofs, and

For three boundles of black Grapes, Mr. Aistri, North, ampton, was 1st, with three bunches of thek Hamburgh.
For three bunches of white Grupes, Mr. L Jordin, gr to

Lord Annaly, Holdenby, won with three good bunches of Muscat of Alexandria, very fine.

VEGETABLES

were staged in considerable quantity, and the quality was were staget in considerance quantity, and the quanty was very good. Ar, Cott was 1st for a collection with Ve teli's Autumn Giant Caulul-aver, Veitch's Selected Carrot, Chelsea Gant Runner Bean Pragnell's Exhibition Beet, Paris Green Articloke, Sutton's Perfection Cucumber, Perfection United States States and Automates, Public's White Tarmip, Allst Crug Onion (very good), Ciles Favourite Potato, Autocrat Pea, and Major Clarke Celery; Mr. Damock being 2nd, and Mr. Cotson 3rd.

In the county class for nine varieties, Mr. F. Douglas was 1st.

Exhibits of single dishes of Ve_etables were good, especially

thions, Tomatos, and P tatos.

There were some good exhibits in the Cottager's Classes, and the competition was keen in the majority of the classes.

The Judges were Mr J. Smith, Mentmore Girdens; Mr. W. Coomber, gr. to Lord Lilford; Mr. Cole, gr. to Earl Spencer; Mr. L. Jordan, gr. to Lord Annaly; Mr J. Knightley, gr. to Sir Hercwald Wake, Bart., and Mr. J. Shaw.

CHESTER.

Argust 5, 6 .- Favoured with fine weather, the committee of the Chester Horticultural Show and Fête held its first exhibition of plants, cut-flowers, fruits, and vegetables, in the Roodee, on Wedneslay and Thursday, and the committee and Mr J WYNNE FFOURKES (Hon Secretary) are to be congratulated upon the success of their efforts to make the show a thoroughly representative one. The competition was keen in most of the classes, and the exhibits generally were of a high degree of excellence. The number of entries in the open to all classes was large. Groups of plants arranged for effect on a space occupying not more than 300 square feet, comprised four groups of Orchids, each occupying a space of 150 square feet. There were forty three entries in the plant classes; fifty four in the cut-flower classes; minety in the fruit classes; and 403 in the vegetable classes-making in all 500 entries. Adding to these figures 1,195 en'ries in the cottagers' classes, a grand total of 1,791 is made Thus it will be seen that keen competition prevailed in all the classes, and that the gentlemen who promoted this successful and promising horticultural exhibition have sucone led in moving the inhabitants of Chester and surrounding district in the right direction

PLANTS.

In the class for twelve stove and greenhouse plants in bloom, Mr. J. Cyfner, Cheltenham, was a good 1st, staging good sized tresh plants of Erica Austiniana, Statice Gilberti, Lyora salicifolia, Allamanda nobilis, Bougainvillea Sandersana, tine in size and flower; Ixora Prince of Wales, Erica Aitoniana, Allamunda grandiflora, Statice profusa, Erica Thompsoni, Lvora Williamsii, Phoenocoma prolifera Barnesii—anall-round good lot of well-flowered plants. Four other lots of plants were shown in this class.

In the class for six flowering plants. Mr. Joseph Roderick, gr. to T. H. Sykes, Esq. Che elle, was 1st with a good lot of plants, including well-flowered examples of Stephanotis flori-bund and Ixora Williamsii - With four specimens of Crotons Mr. B. Cromwell, gr. to T. S. Timms, Est., Liverpool, was a good 1st, staging targe brightly-coloured plants; Mr. Cypher

being a good 2nd.

Specimal plants —Mr. Cyfher was 1st in the class for greenhouse plants, with a fine piece of P torrorowa prolifera Burnesii, and in the corresponding class Mr. Robernek sourcel the premier position with a well-flowered plant of Dud idenia amabiris

Groups were, as is usual at big shows, quite a feature Edmonds, gr. to the Duke of St. Alexans, Bestwood Ledge, Notts, was 1st with a very pleasing arrangement, consisting of small groups with central plants, showing well above the groundwork of Crotons, Pulms, Humea cleguis, &c . intered with Dendrobium Schroderianum, Lilium in variety, François, &e; Mr John Melotyre, gr to Mrs. Pryse, was 2nd, with a good arrangement; and Mr. Robernek was a ereditable 3rd

ORCHIDS

Three groups of Orchids were tistefully set up, Mr. Cyrner being an easy 1st. His group consisted of many good types of Uttleya Mossia and Suderiana, Oncidium Jonesianum flavens, O. papilio, Oncidium Kramerii, &c. Mr. John Robson was and

Messrs Huan Low & Co., Upper Clipton, London, put un a nice collection of Orchids, including a good plant of the curious Swan Orchid (Cycnoches Chlorocheilon), Cattleya Sinderiana, C. imperialis, Odontoglossum Roczlii, Oneidium Standrama, Cartleya volutina, C. speciosissima, Dendrobium Phalenopsis, D. Schroderianum, Cypripedium Dayanum, and Cattleya granulos).

Mesors, Lains: & Maritia, Kelso, emirronted a nice bank Carnations with Palms at the back of the group, and Maidenhair Fern intermixed with the Circuttions, and placed also in front of the arrangement.

CUT FLOWERS.

Messrs, Jones & Soxs, Shrewsbury, were 1st for a rollection of cut flowers, arranged on a space of 12 feet by 5 fe t, the flowers employed chiefly consisting of Orchids, Pan ratiums, Liliums, Carnations, Sweet Peas, &c., intermixed with Maidenhair Fern, Asparagus plumosus and a variety of Grasses, were made the most of. Messrs, Jenkinson & Son, Newcastle, were a good 2nd

Two other collections in the form of devices were arranged with good effect; and the various collections of Carnations neade a good show. Mr. Cambrell, Blantyre, N.B., secured premier position with a grand lot of Carnation blooms, fine in size form, and colour; and Messrs, Laine & Mainer, Kelso, were a good 2nd - Two other good collections were

In the class for twenty four Roses, distinct varieties, Messis, J. Corker & Sons, Aberdeen, were 1st, with a good even lot of solid, fresh-looking blooms; Messis. Harriess, Bodale, heing a good 2nd. Obituary.

JAMES WHITTON. We regret to announce the death of Mr. James Whitton, nurseryman, which took place at Sunnybank Nurseries, near Falkirk, on Sunday, July 19. The deceased was sixty nine years of age, and had been for some time in failing health. Mr. Whitton was a native of Alvth, Perthshire, was heal gardener at Laudor Castle, Berwickshire, for thirty years, and served four Earls of LAUDER. His tilents as a gardener were widely known; and his genial disposition gained him many friends. He began business at Sunnybank fourteen years ago, and is survived by a widow.

THE WEATHER,

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42' Fahr, for the period named: and this combined result is expressed in Daydegrees—a "Daydegree" signifying P continued for twenty four bours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 1, is furnished from the Mcteorological Office :-

"The weather, at the commencement of the week, was changeable over the whole langelon, with thunderstorms and heavy rain in many parts of England. Later on a Later on a decided improvement took place, but on the night of July 28 Lain set in over our western districts, the unsettled weather

subsequently spreading to most other parts of the country. Towards the close of the period, however, the conditions again improved, and became fair and dry generally.

"The temperature was a little below the mean in all districts excepting 'England, S.,' and the 'Channel Islands," where the normal was equalled or slightly exceeded. Highest where the normal was equalled or slightly exceeded. Highest readings occurred in the northern and eastern parts of the United Kingdom on July 26, and in the south between July 28 and 30; but in the west they were observed mainly towards the end of the week. As a rule, the thermometer did not rise much above 70°, but in 'Ireland, N.,' it reached 76°, while in 'England, E.,' and 'England, S.W.,' it touched 77°. Lowest readings occurred on July 28 or 20, when the cheltred thermometer fell to (18° or less in second restored to sheltered thermometer fell to 40° or less in many parts of the United Kingdom, and to 37° in 'Scotland, W.' At Oxford, the thermometer on the grass felt on the night of July 28 to a minimum of 36°.

"The rainfall was less than the mean in a'l districts excepting 'Scotland, W, the deficit being large in the north and east of Scotland, and also in the western parts of

"The bright sunshine exceeded the mean in most districts, hat was just equal to the normal in 'England, N.E. and N.W.,' and slightly below it in the 'Midland Counties.' The percentage of the possible duration ranged from 39 in the 'Channel Islands' and 50 in 'England, S.' to 31 in 'England, N.E.,' and 30 in the 'Midland Counties.'

MARKETS.

COVENT GARDEN, AUGUST 6.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. En.

Best samples do not come to hand quite as freely as last week, and prices for such have a tendency to rise. Inferior simples are still plentiful at last week's prices. J. B. Thomas. Inferior

SEEDS.

LONDON: August 5.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market as presenting quite a holiday character. Trifolium, with an increasing demand and diminishing ter. Priorium, with an increasing demand and aminisming supplies, is dearer. Mustard also tends upwards. New Rapeseed comes cheap and good. Italian Ryegrass offers on low terms. Winter Tares point downwards. Fine seed Rye is most moderate. Canary seed is steady. Clover and Trefoil seeds are firmly held. Peas unchanged.

FRUIT AND VEGETABLES.

ENQUIRIES.

" He that questioneth much shall learn much,"-BACON,

ASPARAOUS.—In his directions for growing Asparagus, Cato (de re rustica, c. 111) advises using sheep's dung only, for every other sort produces weeds. Is that borne out by our experience of English sheep! Columella recommends the use of ashes.

FORMALDERYDE.—Has any reader of the Gardeners' Chronicle experience of the use of Formaldehyde as a preservative of hotanical specimens, either fresh or dry Alnus,

BANKSIAN Roses: Pomona. Layer the long shoots at intervals of 1 foot, securing the shoots with strong wooden pegs and slightly covering with soil at those points.

Begonias Diseased: Il'. C. The rust-like appearance in your Begonias is due to a small white mite, a species of Tarsonymus. The mite is so small and active that it is very difficult to observe it with the naked eye. Mr. Massee has stated in our columns that injury from this mite is very quickly followed by the presence of saprophytio fungi, hence this effect is often mistaken to be the cause. Kill the mites by spraying with tobacco solution, or fumigate the plants moderately upon several successive occasions.

BLACKTHORN AS STOCK : Pomona. You might work on it other Thorns, Bullaces, Damsons, and Medlars, but it is not a good sort of stock, growth being

BOOKS: A. T. My Gardener, by H. W. Ward, published by Eyro & Spottiswoode, contains much My Gardener, by H. W. Ward, pub. information about the cultivation of the commoner species of bulbous plants.

CLEMATIS: Pomona. Almost any of the strong-growing species would make stocks on which to graft Clematis varieties.

FLORIST BUSINESS IN AN AUSTRALIAN T. H. B. If you will send your postal address, we can put you into communication with a person who has been in business as nurseryman, &c., at Sydney, and is willing to impart some useful hints.

Gesnera: G. B. Send better specimen.

NAMES OF PLANTS: Correspondents not answered in AMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—Henderson & Sons. Cassinia fulvida.—J. B. We cannot undertake to name varieties of florists' flowers.—W. 1, Erigeron speciosus; 2, Mentha piperita var.; 3, Veronica spicata; 4, Tritonia croccosmiflora; 5, Tanacetum vulgare; 6, Gaillardia aristata.—J. V. The double vulgare; 6, Gaillardia aristata.—J. V. The double Pomegranate.—S. S. 1, Inula dysenterica; 2, Galium verum; 3, Mentha arvensis; 4, Crepis biennis; 5, Stachys Betonica; 6, Agrimonia Eupatoria.—W. D. 1, Abies brachyphylla; 2, Cupressus (Retinospora) pisifera; 3, Saponaria officinalis; 4, Veronica spicata; 5, an Aster, not recognisable; 6, Acanthus spinosns.—H. P. A, Cornus sanguinea variegata; B, Viburnum Opulus; Cornus sanguinea variegata; B, Viburnum Opulus; Cornus sanguinea variegata; B, Viburnum Opulus; C, Hypericum, not recognised; D, Hypericum Androsæmum; E, Kerria japonica; F, Phillyrea media.—F. H. Olearia Haastii, New Zealand.—J. P. L. 1, Monarda didyma; 2, Panieum plicatum; 3, Xylophylla latifolia; 4, Fittonia argyroneura; 5, Hieracium aurantiacum.—H. P. Tenzinya Gustianus (C. L.) Normach. crium frutieans. S. L. 1, Next week; 2, Reineckia curnea variegata; 3, Abutilon megapotamicum; 4, Hibiscus Cooperi; 5, Pellionia Daveauana; 6, P. pulchra.

SEEDLING CARNATIONS: R. H. Your white Carnation is pretty, the petals smooth, and calyx good. The flowers sent, however, are not large, but somewhat thin. The qualities you claim for it should constitute the variety a useful one for the border, where it would give an abundance of blooms for cutting from.—Carnation. The variety of which you send blooms is a good one, and well worth perpetuating Whether it is one which the trade for home use. would be glad to acquire we are not prepared to Send it to some trade specialist. It is distinct from anything we can call to mind at the moment.

If set across three Columns the lowest charge will be 30s. Page, £8; Helf Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting

to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS .- To Advertisers, Subscribers, TAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may

retent and person that whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements. 41, WHLLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

FOWLER'S MEALY-BUG DESTROYER.

-It is easily applied, is instant destruction to both insect and ova, and does not stain or injure the foliage. In Bottles, 1s., 2s, 8d., 5s., and 10s.—CORRY & CO., Ltd., E.C. Sold hy all Seedsmen.

NEW CALLAS OR ARUM

All must, and will, welcome these varieties, as being the finest and most valuable acquisitions of recent years.

"THE GODFREY CALLA" is equal to the old variety in size, but excels it in whiteness, and is of much dwarfer habit in growth. The spathes are produced earlier, and with grenter freedom, and require less heat to extand. They have also n much more refined appearance.

"DEVONIENSIS."-Nearly all Arom growers have had experience with Little Gem, and with very few exceptions disappointment is the result. Little Gem only blooms occasionally, and the spethes, although very pure, are too flat in form, and have a wilted appearance. Devoniensis is of the same dwarf babit, but the foliage has more substance. The spathes are very freely produced, of the purest white, and of perfect form. The size is about half that of the ordinary Calle. For floral work this variety can be used where others would not be admissible. These Callas are more free-flowering than others, are whiter, and of better

Plants, 10s. 6d. each. Orders now being booked. Trade price on application.

SATURDAY, AUGUST 15, 1896.

ROBERT BURNS AS A FLOWER-POET.

In this special capacity Burns has been, it seems to me, almost ignored. Even Lord Rosobery in his recent great "Centonary" eulogiums of the most gifted of lyrical singers, at Glasgow and Dumfries, did not speak of the poet's remarkable felicity when singing of the unobtrusive, yet exquisitely beautiful flowers of the shadowy woodlands, the waysides, and the fields. And yet Burns was one of those rare spirits who could have deeply sympathised with Wordsworth when he sang:—

"Thanks to that human heart by which we live, Thanks to its tenderness, its joys, its fears, To me the meanest flower that blows can give Thoughts that do often lie too deep for tears."

Nor could be have failed to discern the beauty of such a memorable passage of Wordsworth as this, which, notwithstanding its deep, tender significance, is, I greatly fear, unknown to most readers of the High Priest of Nature:

"The Dusy, by the shadow that it casts, Protects the lingering dew-drop from the sun."

This was entirely in the manner of Burns. the very kind of conception, far-reaching in its meaning, and intense in its sympathy, the tender-souled Scottish singer would, in his tinest moments of inspiration, have written himself. It is not marvellous that he who wrote those memorable passages which I have quoted from his works could also have said of him whose early death he mourned so deeply, when placing upon his grave an imperishable wreath of fondest affection : -" Neighbours wo were, and loving friends we might have been." I can imagine that both Wordsworth and his poetic follower, Matthew Arnold, would have agreed with me in thinking that the "Daisy" of Robert Burns, with all its combined sweetness and power, is the grandest flowerpoem that has ever appeared. There is a remarkable floral passage in Milton's Lycidus; another of equal impressiveness—as I have previously indicated—in Arnold's Thyrsis, one of the noblest elegiac strains ever given to the world. Shakespeare has some tenderly-musical passages on flowers; Keats, Shelley, Byron, Coleridge, and Tennyson, have occasionally very beautiful floral inspirations. Thomas Gray has told us in his Elegy written in a country churchyard, which I visited not without an accompaniment of emotion last year (for are not both the poet and his sister buried there?) -that

"Full many a flower is born to blush unseen, And waste its sweetness in the desert air;"

but is there any one flower-poem existing that can make any approach to "The Daisy" of Burns in soul-reaching tenderness or in manhiest strength? I can say of this inspiration and its influence upon my memory, as he said of the parting-scene with his much loved Highland Mary: "Time but the impression deeper makes, as streams their channels deeper wear." Burns would have been entitled to poetic immortality, and the eternal reverence and gratitude of all lovers of Nature, had he never written any other poem save this. Let any of my English readers who have not read this profoundly-touching improvization, do so without delay, and they will understand my euthusiasm. How powerfully, in the terminating stanza, it predicts his early death!

"Even thou who mourn'st the Daisy's fate,
That fate is thine, no distant date!
Stern rain's ploughshare drives, elate,
Full on thy bloom,
Till graphed based the furgor's weight

Till, crushed beneath the furrow's weight Shall be thy doom!"

Song was his nature rather than his art. As the tree of the forest, at the suggestion of spring, puts forth its delicate leaves, so the nature of Burns, at the touch of tender passion. blossomed into song. His "sweetest lays are those that tell of saddest thought:" from amidst the golden sunlight of present inspiration they cast the shadow of a prophetic sadness far into the future. How noble in its meaning of Christ-like sympathy the identification of his own destiny with that of the meekest and lowliest of flowers! He often finds relief for his very despair in the passionate expression of his mighty strains. His pent-up grief for a love long lost suddenly becomes musical and imperishable in "To Mary in Heaven" (in which there is a floral passage of incomparable beauty)—the most tender and touching of all his lays. His world-embracing love, arising on the tearful wings of pity, broods sadly over the fate of the unconscious Daisy; commiserates the emotions of the wounded hare, and imprecates in language too frequently forgotten, "man's barbarous art." Though, like Wordsworth, he loves to hold communion with the fairest forms of Nature amid the solemuities of the mountains, the weird marmurs of the forest, where

"Fragrant Birch and Hawthern hear

Twined amorous round the raptured scene:"
or the deep-toned monotony of the echoing shore,
his soul was not a star that dwelt apart, for his
was that spirit of gentlest sympathy which
thinks evermore of the hopes and fears, the

sorrows and saddening destinies of humanity.

"The clouds that gather round the setting sun
Do take a soher colouring from an eye
That hath kept watch o'er man's mortality."

And hence, thanks to that great human heart by which he lived; thanks also to those passions which gave him all his weakness and more than half his power, his poems must atways profoundly appeal to the noblest emotions, to the fairest sympathies of men. And potent indeed for good must be the influence of his song, who could not pass by a wounded hare without feeling the infinite pathos of compassion urging him onwards to merey and tenderness; or a humble flower of spring without a lesson to his fellow-creatures on the sublimity of the smallest of God's creations! Devid R. Williamson.

NEW OR NOTEWORTHY PLANTS.

ADIANTUM (HEWARDIA) MALALIENSE, $Jenm.,\ n.sp.$

Thus is a very interesting plant, of a totally different habit to the others of the small section Hewardia, which butherto has contained only three species, all

from Guiana, and all growing together where this was found. I do not include A. dolesum, Kze. (A. Phyllitidis, J. Sm.), which, too, grows with them, for, as Mr. Baker has said, a pair of veins fortuitously anastomosing, give it no just right to inclusion. The plant was discovered by Mr. Ward, who, with the exception of two or three black men who claim that lineage, is the only Scotsman in this department. He came upon it at the greater Malali of the Demerara River, the "Great Falls" of Waterten's delightful classic "Wanderings;" which Falls, though few white men or women have seen them, are known to almost every man, woman, and child, throughout the wide world who speaks Waterton's tongue. Malali, I should have said, means, in the particular Indian tongue, a waterfall. The habit of the new species is exactly that of A. Kendalli, Jenm., of Jamaica, but differing, of course, in all other characters. G. S. Jenman, Demerara.

CAMPANULA ZOYSH.*

Our illustration (fig. 32) of this charming little alpine was taken from a plant exhibited by Messrs. Barr & Son at a recent meeting of the Royal Horticultural Society. It was drawn by Mr. Worthington Smith, is of the real size, and shows the tufts of obovate, rather thick, green leaves, from the midst of which the flower-stalks rise. The flowers are of a light blue colour, and, as is commonly the case with alpine plants, are large in proportion to the plant. The shape is different from that of any other Campanula we can remember, the tube being somewhat angular and flask-shaped, contracted at the throat, and with five short, triangular, connivent lobes. The inner surface of these lobes is studded with hairs, and, as seen in the section, the stamens, which are unlike those of most Campanulas, are short, and occupy the hottom of the flower-tube, whilst the style (which is glabrous) is as long as the flower-tube, and the stigma closely invested by the inflected segments. An insect visiting the flower would, therefore, have to push aside these segments, would be more or less obstructed by the bairs on their inner surface, and would come into contact with the stigma. If that insect had just come from another flower, it is most probable it would be dusted over with pollen, and that pollen would now be deposited on the stigma. It is not at all unlikely that other flowers of this plant might be provided with long stumens and short styles as some Primroses are, but we can only speak from the facts before us. Insect agency in any case is clearly probable, but it is singular, under such circumstances, to find the pollen grains smooth, as they were observed to be by Mr. Worthington Smith, and as shown by him in the figure. This circumstance, together with the characters of the stamens and style, suggest the occasional possibility of close-fertilisation and even eleistogamy. In the young state the flowers are pendulous, becoming erect as they grow older. The plant is a native of the Austrian Alps, and is reported to be difficult to cultivate. M. T. M.

KEW NOTES.

PTERISANTHES POLITA.—Pterisanthes is a genus of about six species of climbing or sarmentose plants, very closely allied to Vitis. It is remarkable in the form of its inflorescence, which is flattened like a knife-

base, nigresecut, brightly polished, above freely rusty, tomentose, 6 to 9 inches long; fronds stiffly erect, a span or more long and broad, bipinnate, very dark olive green, subcortiseous, naked, except on the rachis and costse, which are densely rusty-furfuraceous, consisting of a terminal pinnate portion (with an entire ovate-kureolate and acuminate terminal segment, muchlike the contiguous lateral ones), and with one to three similar basal, horizontally-speaching, pinnate branches, usually of lesser size, but otherwise exactly conform to the terminal part; pinnates 2 to 3 inches long, half to three squarters of an inchwide, oblong lanceolate acuminate, obliquely rounded at the sessile or shortly-stipitare base, the interior side of which is very shortly cut away, bidentate, the teeth appressed in the faintly-serrate groups; veins fine, close, very oblique, repeatedly forked, freely anastomosing, excurrent; son oblong along the upper and lower edges, divided every quarter of an inch or so by the primary incisions of the inagu.

Community Zarre, Wulf, in Jory Collect ii., 122 ; Jorquen Iv a., 144 ; Rare — F. a. Enemp., 5 ; Storm., Fland, vi., 22 ; Granden, October 19, 1845, under the manne C. Loreyi ; Reichenbach, Fl. 6 rman, 19, 1610.

blade, with the male flowers borne singly on stalks at intervals of about an inch along the margins, and the females sessile and scattered about the surface of the flattened blade. The berries are about the size of Peas, and are black when ripe. Some of the species have pedate or trifoliate leaves, and are very similar to Cissus. P. pelita has lately been introduced to Kew from Singapore, and it is now in flower in the steve. It has quick-growing scandent stems, cordate-glabrous leaves about 5 inches long, the margins toothed. The flower-rachis is a sort of modified tendril, the lower pertion being red, 4 to 6 inches leng, by an inch in width, quite flat and membranous, the irregular form and leg-like arrangement of the male flowers bearing an edd resemblance to a flattened lizard. Although not a plant that would win the approval of a floral committee, it would interest the botanically inclined among horticulturists. The best of the species is P. cissoides, which has a rachis 2 inches wide. There is a good figure of this species in Linnaa, 18, t. 8.

DISCHIDIA HIRSUTA.

This is the third species of Dischidia that has been established at Kew, the first being D. bengalensis, a climber, with small fleshy grey-green leaves and minnte green flowers, for many years an inmate of the Palm-house; the second is the remarkable D. Rafflesiana, which, in addition to its orbicular leaves, produces numerous pitcher-like organs 2 or 3 inches long, inflated and perforated at the base with a small hole, through which adventitions roots semetimes find an entrance. The Kew example of this species has developed about twenty new pitchers this year. D. hirsuta is quite distinct from these two in its slender wiry stems, its orbicular fleshy leaves, with irregular surface, and its axillary clusters of blood-red flowers, which are tubular, nearly half-an-inch long, and not unlike those of a miniature Hoya. There is a healthy example of this species in the stovo at Kew, where it is grown on a short stem of tree Fern, and has been in flower for some weeks. Sir Joseph Hooker says, "The species of Dischidia all want careful study. The leaves change in form, and it is not ascertained in respect of many species, whether they may or may not be converted into pitchers." There are about twenty-four species, all natives of the tropics of the East.

MAMMEA AMERICANA.

The Mammea Apple or American Apricot is a wellknown fruit tree in the tropics, where it forms a tree about 50 feet high, with leathery oblong evergreen leaves, white sessile flowers about the size of the flowers of the Tea plant, and very large fruits, the pulp of which is sweet and aromatic, and is caten cut into slices and steeped in wine, or made into preserves of various kinds. The seed is as large as a hen's egg. Although long cultivated at Kew, it is now flowering for the first time in the Economic-house there, the plant being about 10 feet high and grewing in a large pot. Some of the flowers have set for fruits. According to a note in a list of the economic plants cultivated in Jamaica, the wood of the Mammea, which is remarkably durable and resists damp, is beautifully grained. The bark has astringent properties and is nsed for dressing sores. A liquor known as "Crême des Creoles," is distilled from the flowers in Martinique, and the fruit is russet-brown when ripe, and has a peculiar edeur. It is said to often attain the size of a child's head.

Morea Robinsoniana.

The giant Iris of Lord Howe's Island has flowered with unusual freedom in the Succulent-house at Kew this year. It developed spikes in the spring, which grew to a height of 8 feet, and pushed lateral branches before the first flowers opened on May 21. From this date till August 5 fresh flowers were produced on every day except eighteen, the number expanded on each of the other fifty-nine days varying from four to 113. The total number of flowers produced was 1666, an average of twenty-eight per day. The flowers expanded in the morning, and by the following morning they were folded and withered. Each flower was about 3 inches in danneter, star-like, the segments broad and spreading, pure white, with a blotch of yellow at the base of the three broader segments.

I so the (the esta) malaticer, Jennie, n. sp. Roottick producte, report, closely, biserally knotted, clothed with densel, imbrigated bruneous fine scales, stipites erect, senal, not attendated, angular, ultimately bare at the

Mr. Charles Meere, the ex-director of the Sydney Botanic Gardens, who discovered this plant in Lord Howe's Island, recently saw the plant at Kew, and said that it was equal to any that he had seen wild, except that the leaves were a little shorter. This plant first flowered at Kew five years ago, and not again till this year. [See Gardeners' Chronicle, 1872, figs. 123 and 124.]

SOLANUM CERNUUM.

There is a fine example of this tree-like Solanum in the Temperate-house at Kew. It has a woody stem, forked at the top, and bears a head of noble leaves, each 2 feet or more long, and from 1 to 1½ foot wide. The stalks are clothed with long, thin, brown, chaff-like hairs, which, according to Sir Joseph Hooker, gave rise to the Portuguese name for the plant, viz., "Braco de Preguica"—the arm of the

can be brought before the public. Notwithstanding these eirenmstanees, there are a few new seedling Hyacinths which surpass the existing trade varieties, although the standard of these is very high now. The following varieties deserve special attention, and many of them will become the leading sorts of the trade.

Lohengrin is a double rose-coloured sport [seedling?] of the well-known double blue Charles Dickens, which is one of the best double Hyacinths in the trade. Lohengrin has kept all the excellent qualities of its parent, and forms large, dense trusses of fine rosy-red bells.

Tolstoi is another double flowering novelty of high standard. The bells are very thick and fleshy, in the way of those of Kastanjitleem, of a most delicate shade of pink, almost rosy-white, and form an effective truss.

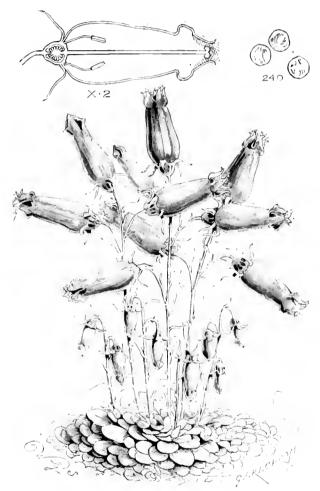

Fig. 32. - Campanula Zoysii.

Flowers pide blue, section of flower magn, two diam; (pollen grains magn, 240 diam, (See p. 482.))

ant eater. The Kew plant came originally from the garden of the late Sir Georgo Maccleay, who grew it in a large conservatory under the name of S. jubatum. It bears clusters of short-stalked white flowers, an inch across; but it is as a noble foliage plant that it deserves the notice of horticulturists.

Aristolochia gigas Sturtevantii.

There is a strong plant of this grand climber on the roof of the Victoria-house at Kew, which is now flowering freely, two or more of its noble flowers being open on most days. When the Victoria Water-Lily is in flower, the mixture of the penetrating odours of the two plants is almost overpowering. W. II.

NEW HYACINTHS.

The number of new Hyacinths, compared with novelties in other groups of florists' flowers, is rather small. In consequence of the slowness of multiplication, it takes several years before a new seedling Hyacinth La Grandesse, double white, is certain to become one of the very best double white leading Hyacinths in the trade, being a sport from the single white variety of the same name. It obtained the highest number of votes in the Dutch bulb growers' plébiseite. The double variety produces a most splendid spike with very regular and full bells of the purest white. It has the same excellent forcing and bedding qualities as its parent.

Pale and potcelain-blue Hyacinths being much in demand, there is a tendency to obtain novelties in these shades, which surpass the older standard sorts. The results of these crossings have proved very successful, the two following showing a great advance on older forms,

Holbein throws up a long, regular, and compact truss of very delicately blue-coloured single hells, and may be considered as one of the foremost trade varieties of the future.

Johan is an excellent forcing variety, forming a gigantic truss of time soft percebin-blue single bells.

Other meritorious blue Hyacinths of last year are:-

Figure, a very distinct blue variety, the lobes being pale blue, whereas the bells are tinged bluish-black outside, thus producing a quite unique effect.

Gounod makes loose and regular trusses of well-shaped single bells, which are light greyish-blue, striped dark blue on the petals.

Richard Wagner, a compact, medium-sized truss of regular single bells of a very distinct pale porcelainblue.

Besides the pale-blue varieties, the pure yellow Hyacinths have been much improved of late. The best new yellow varieties include the following, viz.:—

Lemon tree, a splendid compact truss of s ift yellow single bells,

Gold light, a medium-sized truss of brilliant golden-yellow bells; and

Hofdyk, a regular truss of fine large, single lightyellow bells.

A charming orange yellow variety is Trilby, and Het Loo is a good dark carmine with orange shade. The latter was personally named by the Queen of the Netherlands, when visiting "Bulb Land" in 1894. "Het Loo" is the name of her favourite residence.

Splendens is a very effective rose Hyacinth, like Waterloo, of the same colour, and also a new acquisition.

The above is a selection of the best new Hyacinths obtained, and of late offered to the trade, by different Dutch growers. They are all rather expensive at present, but the descriptions given above may interest the reader, as they refer to many leading Hyacinths of the nearest future. Ernest K. Krelage, Haarlem.

ORCHID NOTES AND GLEANINGS.

MASDEVALLIA SCHRODERIANA.

The beauty of this species is equalled by few others of the genus. The bright-green foliage is from 4 to 6 inches in height, and the flowers stand well above it. The colouration is a beautiful combination of orange, yellow, amethyst, purple, and white. The length of the sepal-tails is nearly 3 inches, the two lower ones recurved towards the peduncles. Introduced by Messas. Sander, it was awarded a First-class Certific do in 1820 by the Royal Horticultural Society A plant is flowering at the present time in the Royal Potanic Garden, Edinburgh.

ZYGOLETALUM GAUTHERI.

This pretty species is also in flower in the above gurden. In some gardens a difficulty is experienced in growing and flowering this plant with success. Here it grows on the shady side of the Cattleyahouse, and is watered freely during the growing period. It is grown upon a tree Fern trunk. The bluish-purple colour of the lip, and brown and green spots and blotches upon the sepals and petals make the flowers very attractive. A native of Brazil, it is a plant which does not appear to be imported in large quantity. R. L. H.

REMARKS ON THE FRUIT CROPS.

See Tables, pp. 124 to 131, (Continued from p. 177.)

4. MIDLAND COUNTIES.

BUCKS.—Apples are an abundant crop, all treesbeing loaded with fruit. Strawberries were of excellent quality, Royal Sovereign and President taking the lead. Red and white Currants fair, but trees somewhat blighted; black Currants very heavy crop, and of excellent quality. Raspherries an average crop, quality good. Pears are searce, owing to prevailing frosts when trees were in bloom. Peaches, Nectarines and Apricots, are not grown outdoors here. Filberts are plentiful, but trees somewhat blighted. On the whole, our fruit crop is satisfactory up to the present time. Heddey Water a., A den Clinton Gardens.

—— Generally, bush fronts are under average, both Red and Black Corrants being thin, and Raspberries

dried up, owing to continual drought. Apples in this neighbourhood are a good average crop, and the trees, considering the dry weather, are looking well. Should rain come soon, the crop will be a good one. Of orchard-trees, Blenheims and Dutch Mignonue are especially well eropped; and of bush-trees on the Paradise stock, Lord Grosvenor, Grenadier, Eclinville Seedling, Lord Derby, Bismarck, Lane's Prince Albert, Cox's Orange, the same remark applies to these. Cherries on walls have been good; standard and orchard-trees very thin. Pears on walls, excepting Williams' Bon Chretien, are scantily cropped; while bush-trees on Quince stock are, taken collectively, about two-thirds of a crop. Peaches and Nectariues on walls cropped heavily, and have required severe thinning. Apricots only a partial erop. Nuts abundant. Plums a good crop. Chas. Herrin, Drop-Apricots only a partial crop. Nuts more, Bucks.

- Apples are a heavy crop, such varieties as Stirling Castle, Lord Suffield, and Keswick Codlin. are bearing a very fine crop. Early dessert varieties are also good, such as Beauty of Bith, Gladstone, Early Margaret and Irish Peach. J. Smith, Mentmore, Leighton Buzzard.
- The fruit crop round here is very thin in places, especially in fruit gardens surrounded with woods. Cherries set a good crop, but dry weather setting in, they nearly all dropped off. Apples and Pears early took the blight, but using the syriuge freely, we have saved a fair sprinkling. Pears set well, but dropped, o ving to drought. Peaches and Nectarines are good outside. Plums good on walls. All bush fruit and Strawberries are excellent. American Blackberries, such as Wilson Junior, Liciniatus, and Kittatiny are producing good crops. A. B. Walds, Cliveden, Maiden-
- A deficient rainfall, with much aridity combined, has been the means of increasing insect-pests to a very great extent; so much so, that the size and quality of certain kinds of fruit will thereby be greatly deteriorated. Apple and Plum crops suffer most in this district. Peach and Nectarine trees are fairly clean, considering the dryness of the season. The prolonged period of ungenial conditions that prevailed after the fruit had set did much mischief in causing the fruits to drop. ti. T. Miles, Wycombe Abbey.

Cheshire. -- Apples are a very poor erop indeed : Lord Suffield, Potts' Seedling, Lane's Prince Albert, Grenadier, and Cox's Orange, have a fair crop, but many of the trees have very few fruits. Pears are a worse crop than Apples, Louis Bonne and Beurré Clairgeau are two of the best for crop. Plums are thin, too, excepting the Czar, which is bearing a full crop, and requiring to be thinned. The best and heaviest crops are the Gooseberries, by reason of this, and not sufficiently thinned in the green state they are rather undersized. Robert McKellar, Abney Hall Gardens, Cheadle.

- - All fruit trees bloomed abundantly, and gave promise of a good fruit year, but owing to the longcontinued hot, dry weather, with 10 of frost on the night of May 20, the bloom and foliage were much injured, and the fruit crops much less than were expected. Apples and Pears are under the average: Plums and Cherries about an average. Peaches, Nectarines, and Apricots on protected walls an abundant crop. Strawberries on light soils generally small. Foliage of bush fruit much attacked by insects, and unhealthy-looking. W. Whitaker, Crewe Hall.

LANCASHIRE.-In spite of the very dry weather we have experienced here since April, fruit crops are very good. Apples and Pears have been much troubled with eaterpillar on the foliage, but the fruit is sound and good. Peaches on the open walls a grand crop, and the trees are clean and healthy, owing to constant use of the hose-pipe. We gathered the first dish of Early Beatrice on the 5th inst., and Early Rivers on the 8th, some of the latter weighing 8 oz. The Strawberry season, owing to the drought, has been rather Stort. B. Ashton, Lathon House Gardens, Ormskirk,

DELICESTIBLE - The fruit crops here are remarkably good, and of fair quality, considering the heavy crops of all sorts last year. Apples are unusually good. Blenheims and Cox's Orange Pippin are cropping well; Northern Spy, Wadhurst Pippin, Lemon Pippin, and Besspool, which are amongst the most useful late dessert kinds, are fruiting well. Suffield, Tower of Glauis, Flower of Kent, and Grenadier are loaded, as are also some of the newer sorts, such as Lady Sudeley, Washington, Lane's Prince Albert, Bismarck, and Gascoigne Seedling. Amongst Pears, Williams', Louise Bonne, Beurré Hardy, Duchesses, Knight's, and all the Bergamots are good. J. H. Goodarre, Elvaston Castle.

HERTFORDSHIRE .- Some of the more tender kinds of Apples received serious check from cold winds and slight frosts early in May, and in consequence trees became badly infested with aphis and red-spider, and are making but poor growth. Pears are slightly below average, but owing to early mulching and wateriugs the trees are looking well and the fruits are swelling satisfactorily. Plum-trees are badly infested with blight. Cherries, excepting Morellos, are very poor. Bush fruits are a satisfactory crop, and Black Currants much above average, and very good. E. Hill, The Gardens, Tring Park.

- --- Generally speaking, this is a more fruitful season than usual. Small fruits have been fully up to the average, except red Currants; Gooseberries have been a very heavy crop; Strawberries have been fine in quality, but the season was short through the dry weather. Pears have been thinned to a great extent, particularly on bush and pyramid trees; Apples are a good average crop, and Peaches are of splendid quality, the colour nausually fine. G. Norman, The Gardens, Hatfield House.
- Small fruits in this neighbourhood have suffered from the drought, although the quality has been good, the quantity would have been increased had rain fallen at the proper time. The excessive heat has necessarily made the small fruit season much shorter. Raspberries and Strawberries appear to have suffered from the drought more than Black and Red Currants. Apples, Pears, Peaches, Nectarines, Apricots, look promising, but Plum orehards have but scanty crops; and Cherry orchards are disappointing in some places, while others possess a good crop. II'm. Garman, Frythesden Girdens, Great Berkhumsted.

LEICESTERSHIRE,-All kinds of fruit-trees blossomed abundantly, but in most instances they failed to set a heavy crop, and many of the Apples have fallen since, owing chiefly to exhaustion of the trees following the heavy erop of last season, aggravated by the dry weather this spring. Apple-trees are remarkably clean and healthy; Plums and Cherries have been much infested with aphides. Peaches and Nectarines are healthy and clean, and have shown no blister where they are protected with Rendle's glass coping. W. H. Divers, Belvoir Castle Gurdens,

- The fruit crop generally is satisfactory. A large Fig tree which is trained on a wall with a southwest aspect has an excellent crop of fruits, some of which are commencing to ripen. The flavour of these fruits for the past three seasons has been first rate. Thos. A. Metcalfe, The Gardens, Rolleston.

NORTHAMPTONSHIRE .- Apples, Pears, and Plums have improved much since rain has come. Morello Cherries are almost a failure. Currants (red, black, and white) are very plentiful; also Gooseberries. Peaches and Nectarines have improved, but they were attacked by the blister-fungus. H. Kempshall, The Gardens, Lumport Hall, Northampton.

NOTTINGHAMSHIRE, -Apples, Pears, and Plums, when in bloom, looked promising, the individual blooms were strong and healthy, but some were destroyed by frosts, and owing to the continued dry weather, many fruits are falling now. Still, we shall have a good average crop of Apples, Pears, and Plums, though not so plentiful as was promised in early spring. Small fruits are abundant and good. A. Henderson, Thuresbu.

Oxfordshire. -Apple trees are healthy. Pears a capital crop, especially ou walls. Plums heavy ou

walls. Birds destroyed a good many buds on open trees. Cherries good, especially Morellos. Peaches and Nectarines a capital crop, leaves blistered badly in spring, but scarcely a tree on the walls of any kind has missed fruiting. They had a good early watering, and were heavily mulched. Subsequent waterings have been given when necessary, especially to Pears on Quince stocks. Small fruits of all kinds have been abundant, and trees healthy. Strawberries on the younger beds have been good, on older beds very poor. Royal Sovereign, President, Vicomtesse, James Veitch, Hélène Gloire, and Latest of All were the best. George Stanton, Park Place, Henley-on-Thames.

SHROPSHIRE -Fruit has suffered from the drought and consequent blight, especially eaterpillar and redspider. Orchard trees are carrying better crops than trees within the walled garden. King of Pippins, Lord Suffield, Blenheim Orange, Ecklinville Seedling, Beauty of Kent, Thurle Pippin, Northern Green, Cox's Orange Pippin, and Cox's Pemona are amongst the best-cropped Apples. Our rainfall for the first six months of the year was only 6.99 inches, which is 5 or 6 inches below the average. A. S. Kemp, Broadway, Shifnal, Salop.

--- The dry hot season has prejndicially affected the small fruits, and they have ripened earlier than usual. I gathered the first outdoor Strawberries, John Ruskin, on May 25th, an average crop, but smaller than usual, and soon over. Raspberries are a very poor crop, and small. Red and white Currants about one third under average. Peaches, Nectarines, and Apricots good and early; I gathered first Peaches, Alexander and Waterloo, on the 30th of June, from the open walls, which is earlier by twelve days than last year. Apples and Pears are irregular, and poor crops. Of Apples, Lord Suffield, Hawthornden, Potts' Seedling, Winter Greening, Bess Pool, King Pippin, Orange Pearmain, and Ribston Pippin are bearing better than most varieties. G. Pearson, Attingham Gardens, Shrewsbury.

- Of Apples, the variety Lord Suffield is the only one that has a crop. Of Flums, Victoria and Prince Engelbert have a good crop. Raspberries are extra fine; the caterpillar has been very troublesome to the Gooseberries this year. D. Owles, The Gardens,

Apley Castle, Wellington.

STAFFORDSHIRE.—We had a splendid bloom on Apple trees, but have only an average crop, and the trees are infested with red-spider more than I have ever seen them. Pears are a very thin erop, so are Apricots. Plums have a moderate crop, and Gooseberries and all kinds of Currants a very heavy one, but Strawberries and Raspberries have the thinnest erop we have had for years. J. Wallis, Keele Gardens, Newcastle.

---- There was prospect of a good fruit crop in the spring, but from blight and drought Apples have nearly all fallen. Of Pears, Williams' Bon Chrétien is doing well, and some other early kinds, but fruits of late varieties are scarce. Bush fruits have been plentiful but small; Strawberries were good, but the season short. Peaches, Nectarines, and Apricots outside are earrying a grand crop. G. H. Green, Enville Gurdens.

WARWICKSHIRE .- The Apple crop in this district is much under the average. Pears, with the following, exceptions are almost as bad :- Beurré Diel, Beurré d'Amanlis, and Beurré Bachelier. Peaches are good, and the trees are ripeniug earlier than usual. Apricots a good crop, but earwigs and auts are very troublesome. James Rodger, The Gardens, Charlecote Park.

---- The flowering season of the various fruit trees was this year most favourable to an excellent set of fruit, and there is a good promise that we shall reap the benefit therefrom. The crops in the gardens here, and those also in the neighbourhood which have come under my notice, are generally good. True during the flowering and setting period we had, perhaps, more than our usual attack of eaterpillar and aphis, and being short-handed we were obliged, nolous volens, to allow those unwelcome marauders to have very much their own way. These having done

the best for themselves and the worst for us we find there is still left a plentiful fruit harvest. With the exception of a few ordinary and some extraordinary thunder storms, accompanied by heavy rains, the season has been unusually dry. Luckily I had at my command an ample quantity of stablelitter, with which, early in the season, we freely mulched our fruit-trees, including the smaller fruits, for which seasonable attention we have had excellent returns. Not only has the mulching a most beneficial effect on the production of fine fruit and healthy leafage but at the same time it most effectually prevented an up-rush of weeds. As we are now considerably to the leeward of midsummer, with days perceptibly shorter, accompanied by long dewy nights, crops will, with such help, grow on to maturity, and if a timely shower should fall it will increase the productiveness of one of the most pleasant and bountiful seasons our county has been blessed with for many a long year. W. Miller, Combe Abbey Gardens.

— The great feature of the present season's crops in this district is undoubtedly the enormous quantities of Strawberries, Raspberries, Gooseberries, and Currants, which have been produced with remarkable uniformity. Apples and Pears are very irregular. In some gardens they are abundant, in others the crop is a failure. In regard to Plums, Victoria seems to be the only variety bearing a heavy crop. Peaches and Nectarines are a good crop where insects, have been combatted, and the trees well watered. D. Dankin, Castle Gardens, Warwick.

5. SOUTHERN COUNTIES.

BERKSHIRE.—The prospects during early spring of a good fruit season have been much discounted by drought and the hordes of eaterpillar and insect life with which the trees have been infested. Many fruits have fallen, especially Apples, and I anticipate the bulk will be small, as the rainfall here from January 1 until July 24 was 7.94 inches. The average at Windsor is 13:00 inches. In a collection of Apples and Pears numbering several hundred varieties, it is impossible to name many bearing good crops without giving a tabulated list for comparison. Of Apples, the following are bearing heavy crops: Lord Grosvenor, Lord Suffield, Forfar Pippin, Frogmore Prolific, Baldwin, Bismarck, Taylor's Seedling, Jonathan, and some others. Pears: Beurré Hardy, Emile de Heyst, Doyenné d'Alencon, &c. Of Strawberries, the best here have been Sensation, Countess. Searlet Queen, Lord Suffield, A. F. Parron, Latest of All, Waterloo, Frogmore Gloede, and Aromatic. O. Thomas, Royal Gardens.

I have a heavy Apple crop; my poultry run is my orchard ground, and it is under grass; I feed the poultry alternately under the trees, and it is much the worse for the insects; there is not a caterpillar left. The trees have superb foliage, and as to the fruit, as someone down in Kent says, "Come and see." I take a wheelbarrow filled with wood-ashes, and in dewy or drizzling weather, with a shovel toss it wholesale over and upwards. It is much the worse for the eggs of the insects, and the better for the grass. Robert Fenn. Sullamstead.

Apples are variable, and not more than half a crop. Pears on walls and on open trees are an average crop, but small. Plums on walls are good, but there are very few on open trees. The same remark applies to sweet Cherries. Peaches and Nectarines are again a full and satisfactory crop, and the trees exceptionally clean and healthy. Of Apricots, Shipley's is the only variety bearing a crop. Strawberries were very good; I gathered fine fruits of Royal Sovereign from open quarter on May 28; too much caunot be said in favour of this variety. T. Turton, Maiden Erlegh Gardens, Reading.

— Of Apples, Adams' Pearmain, Devon-hire Quarrenden, Cockle Pippin, Ribston Pippin, Court of Wick, Cox's Orange (grand), Lord Suffield, Keswick, Frogmore Prolific, Cox's Pomona, Peasgood Nonsneh, Blenheim, and Orange, earry the best crops The best Strawberry, both for forcing and early work outside, is Royal Sovereign. F. J. Thorne, Sunningdale Park, Ascot.

Hampshire.—Owing to the prolonged drought, the season of 1896 will be one of the worst experienced here for many years. Apples are almost a failure, and little better can be said of the Pears. Peaches on walls are good, and the smaller fruits have been extra good, a heavy thunderstorm on June 10 (rainfall 2·13 in the twenty-four hours) being the salvation of the crop. Plums are an average crop, and the same may be said of Cherries and Nuts. A. Maxim, Heckfield Place, Winehfield.

(To be continued).

FOUL BROOD OR BEE PEST.

For a broad or Bee pest is the most terrible scourge of apiculture. It spreads so rapidly by contagion in a single reason, that, unless precautions are taken, a whole neighbourhood may become affected, and the chances of successful bee-keeping therein will be seriously imperilled, if not utterly destroyed.

Foul brood is caused by a rod-shaped microorganism, called Bacillus alvei, which increases by splitting, and has, under certain conditions, the power of forming spores. It is important to note that bacilli are present in the earliest stages of the disease, but in the latest, when brood has become rotten and coffee-coloured, or has dried up to a scale, they turn to spores. These represent the seeds of the evil, and retain the power of germinating into bacilli when in contact with a suitable nourishing medium at a proper temperature, even after the lapse of long periods.

They are endowed with wonderful vitality. Freezing and boiling, carbolic acid, phenol, thymol, salicylic acid, naphthol beta, perchloride of mercury, as well as creolin, lysol, cucalyptus and naphthaline, which evaporate at the ordinary temperature of the hive, prevent the growth of bacilli, but have no effect on the spores. From this it will be seen how great is the difficulty in curing foul brood, unless the disease is attacked in its earliest conditions.

19 accessed in its earnest countrions.

When stocks are found weak, working languidly, very slightly profitable, and swarming little, foul broad may be suspected. If it is present, an examination of the combs will show some cells (namy or few) with dying or dead larva-in them; others with their covers sanken or perforated, while the cells of healthy broad are usually compact, and the grubs are plump and of a pearly whiteness. When healthy, the young larve are curled up in crescent shape at the base of the cells. On the other hand, if diseased, they will be found extended horizontally in the cell, present ing a flabby appearance, and of a pale straw colour. begin to decompose, the colour changes to brown. T They then dry up till all that remains of them is a brown seals adhering to the side of the cell. Should the larve survive until cap-ping takes place, a few of the cell covers will be found here there slightly indented and darker in colour than those of healthy broad. The capped cells will be observed in Irregular patches and mostly perforated. On removing the capping, the contents will be seen to consist of a putrid, sticky, elastic, coffee-coloured mass, formed of the The bees do not seem to have the power to clean out the foul cells, and so they remain, spreading infection within the hive, until the stock becomes too weak to defend its stores, when some neighbouring colony probably robs it, and in doing so curies away the seeds of disease and death, which are thus spread, until all the hives of a neighbourhood may be fatally affected.

Hives in which foul brood exists give forth a sickly and unpleasant smell, and when the disease is of a malignant type and in a very advanced stage, the foul odour may be frequently detected even at some distance from the untranse.

It should be noted that chilled brood must not be mistaken, as it very frequently is, for foul brood. In the former the dead larvas turn first grey, and afterwards become nearly black (never brown, as with foul brood). The larvas, dead from cold, are also generally removed by the bees, but they seldom attempt to carry out those which have died from disease, unless disinfectants to arrest decomposition are used. Adult as well as immature bees suffer from the pest, but these leave the hive to die

Experience has platnly shown that with foul brood—as in all epidemic diseases—the weak, sickly, and badly nourished are attacked, and become centres of infection to others. So it often happens that as colonies become weak, bees from healthy hives rob them of their honey, and thus curry off the germs of the disease along with their ill-gotten gains.

Another very important point is that the bec-keeper may himself be the means of spreading the pest by indiscriminately manipulating, first diseased, and then healthy hives, without taking proper precautions to disinfect himself and his appliances. Combs which have contained foul brood return the spores. The queen lays eggs in the cells and the workers deposit their honey and pollen in them. Both honey and pollen in this way become vehicles for the transport of the disease to the larve in the process of feeding by the nurse bees. Under no consideration should infected hives or combs be knowingly exposed to the visits of bees. Carelessness in this respect may work immense mischief to neighbouring stocks and apiaries.

In endeavouring to get rid of foul brood, efforts must be made to raise to a high standard the lowered vitality of the bees, which first enabled germs of the disease to get a footing. This will be effected by keeping only strong stocks, with young and proline queens, and good wholesome food, combined with cleanliness and proper ventilation.

bined with cleanliness and proper ventilation.

Foul brood is so extremely contigious that it is advisable stall times to adopt preventive measures against infection. Nighthaline in balls is generally used for this purp set; two of these, split in half, being the proper dose. The pieces are placed on the floor-board of the hive in the corner farthest from the entrance. The temperature of the hive causes the naphthaline to evaporate, and it must be, therefore, renewed as required. All syrup used for feeding should also be medicated with riphthol beta. When the bee keeper has been in contact with discused stocks, clothes, appliances, and hands must be washed with carbolic soap, and other articles disinfected by spraying with a solution of one ounce Calvert's No. 5 carbolic acid in twelve ounces of water.

It was formerly thought that honey was the only source of infection, so that, if bees were starved until they had got rid of the honey curried by them from the diseased hive, a cure would be effected. It is now known that the starvation method, good as far as it goes, has always failed from the fact of its not being supplemented by disinfection of hives and applitness.

When the disease is discovered in a weak colony, the destruction of bees, combs, frames, and quilts, together with a thorough disinfection of the hive, is by far the best course to pursue. The spores are thus annihilated, and the source of infection removed.

It, on the contrary, the colony be still strong, the hees may be preserved by making an artificial swarm of them. They should then be placed in a straw skep and fed on syrup of which three grains of naphthol beta have been added to every pound of sugar used, the naphthol beta being dissolved in alcohol and added to the syrup while still warm.

alcohol and added to the syrap while still warm.

The infected frames, combs, and quilts should then be burned, and the hive disinfected by being either steamed, or scrubbed with boiling water and soap, and then painted over with a solution of earbolic acid (one part of Calvert's No. 5 carbolic acid to two parts of water). When the smell of the disinfectant has disappeared, the hive will be ready for use. The bees must be confined to the skep for forty-eight hours, by which time all honey they may have taken with them will have been consumed, and such of the bees as are diseased will have died off. Those remaining should then be shaken from the skep into a clean frame-hive furnished with six frames, fitted with full sheets of comb-foundation, and must be ted with medicated syrup for a few days longer. The skep used as their temporary home should be burnt. In order to avoid chance of robbing, all such work as is here described should be done in the evening, when the bees have ceased flying for the day.

It may be added that in attempting remedial measures of the nature described, it would be desirable, wherever such help can be procured, to seek the advice of a competent expert. 1. Whitehall Plan, London, 8.W., July, 1896.

VIOLAS.

A SEASONABLE and timely note appeared in your last issue in respect to the proposed trial at Chiswick of these increasingly popular plants. It has been proved that failure in their culture is due in the majority of instances to planting the wrong sorts and at an improper moment. But there is another point too frequently overlooked, and it is the undoubtedly coolloving nature these Pansies have, and unless this is considered, and the beds or borders prepared accordingly, failure in some degree is sure to ensue. With very special care and attention after planting, and equally special care when planting, Violas may be flowered with fair success after spring planting. But you cannot possibly get the best results from it, but lose more than half of the beauty and worth of Violas in the garden. If they are planted in their permanent positions during the first or second week in October, in soil deeply worked, and rich, the plants have the advantage of becoming established during the autumn months. Few plants are capable of providing so rich a display of blossom as Violas, and they are equally remarkable for diversity of colouring. Very important for the complete success of these plants, is that only freshlyrooted cuttings, and not divisions of the old stools, be planted, as the former are far more vigorous, beside being more compact. It is good practice, and particularly so when heavy antumn raius are frequent after planting, that the surface of the soil be stirred at least once a week either with small fork or hoe. When planting in lines, it is desirable to place the plants in a rather deep furrow, and as growth ensues, to earth the plants up with dry, well-rotted cowmanure, leaf-soil, and loam, in equal parts. This may seem a deal of trouble, but I have proved its

officiery. It has produced plants by the end of the year composed of a score or more shoots such as are usually obtained only in April or May. The late Mr. William Dean was a firin advocate of the earthing-up practice in autumn, mainly to encourage fresh growth from the base, and provide protection. By planting in furrows, the operation is quite easy and simple. It was from Mr. Dean that I obtained the hint, and I could scarcely have eredited that the results would have been so advantageous. Where beds on the lawn are devoted to Violas, the surface should be slightly below the lawn level, and flat, or nearly so, in order that a thorough saturation of water may be given if desired. The present time is an excellent one for inserting cuttings, selecting the freshly-made growths from the centre of the tuft, and not the old flowering stems or growths, which, by comparison, are useless. A few old plants, if cut down at once, will quickly develop plenty of young shoots, which, if plucked out by finger and thumb, will in many instances have tiny roots already upon them. Insert these in a shady place in a frame, or behind a north wall, and as soon as rooted pinch the point of the growth out, to encourage breaking from the base. By allowing the cuttings a fair amount of space, compact plants will be available for planting in October, with breaks already issuing from the base. Plants of this stamp are much better than others with only a single leg to stand on. E. Jenkins, Hampton Hill.

VIOLA, HOW PRONOUNCED.

We have hardly got over the discussion which raged so freely respecting the proper pronunciation of the name Gladiolus, when another hare is started by a querist who at the recent conference at the Botanic Gardens, Regent's Park, wanted to be informed as to the proper pronunciation of Viola The somewhat affected one getting into common use is Vē-ola, the "i" being pronounced "e," but soft. That is the style of the cult, who always seem to be fond of pronunciations of the mineing order. The querist in question wanted to know if using a plain English accent to Viola, we should be right in pronouncing an allied plant ve-olet. Now there are in common use two pronunciations, Vi-ō-la and Vio-la, the first syllable short and soft. The first is the old style, the latter, the later common style, whilst the perversion of the "i" into "e" is presumably the new style. If Viola is to be regarded as a purely Latin term, then its pronunciation must be governed by its derivation. If on the other hand we regard it as a purely vernacular term, such as Violet, Pansy, Daffodil, &c., then should its pronunciation be governed by eustom. That the term is not used in its botanical sense by raisers and growers of Violas there can be no doubt, but it is by them regarded entire'y as a common and well understood appellation. When, however, at a conference some two or three diverse accentuations are heard, there is wisdom in having the correct one made not only clear, but constantly employed; even the most unlearned does not like to be caught in any lapsus lingue. A. D.

FLORISTS' FLOWERS.

OLD CARNATIONS AND PICOTEES.

Ir has been thought and said that the constant culture and propagation of a florist's flower, and especially of a Carnation, leads to certain deterioration and weakness of constitution; whilst it has also been stated that the act of placing the plants under protection at the time of flowering tends to certain debilitation. It is difficult to recognise these statements with the position of certain fine old varieties on the exhibition-stage at the recent Carnation shows. Take, for instance, that fine old scarlet bizarre, Admiral Curzon, which was sent out in 1845—fifty-one years ago—and which to-day, in company with its seminal offspring, Robert Houlgrave, shares the distinction of being the finest S.B. in cultivation. The late Mr. E.S. Dodwell said of it, with

much truth, that it is "quite seven times in ten the best flower of the exhibition." Its raiser, James Millwood, of Derby, is long since dead; he sold the plant before it bloomed to Mr. Easom, and it is therefore found in catalogues under the name of Easom's Admiral Curzon, pink and purple bizarre. Sarah Pavne has also been well shown this season; it was sent out in 1847. It was raised at Woolwich by one Ward, a veteran florist, and though regarded as a weakly grower, it yet survives, and is to be found in almost every collection. It almost invariably stands second, as Admiral Curzon does in its class-in any selection of P. P. B.'s. Mr. Dodwell testified to its repute by stating -"In its way, I believe, as with Admiral Curzon, it will never be surpassed." Next in point of age is Scarlet Flake Sportsman, a sport from Admiral Curzon, which "originated in 1855 in the collection of Mr. John Hedderly, and like its parents, it went at one bound to the head of the class," where it still remains. This was shown in fine character, both at the Crystal Palace and at Birmingham, and took in both places all the leading prizes in the class for searlet flakes. Cristi-galli, rose tlake, though not shown so much this year as usual, was in good character at the Crystal Palace. This was raised at Royton, Lancashire, and sent out in 1873, has been in cultivation twenty-three years. James Douglas, a superb purple flake, and one of the very best of its class, was sent out in 1876, and will in all probability be found in collections a quarter of a century hence. C. B. J. D. Hextall, still a very fine and leading variety, was sent out in 1874.

There are some Picotees which date back for a number of years. One of the oldest is light red edge Thomas William, which has been in cultivation some forty years, and is yet at the head of its class. Heavy red edge John Smith, sent out from Bradford in 1864, is also at the head of its class. Dr. Epps, another heavy red, raised at Darlington, has been in cultivation forty years, and is yet much grown for exhibition. Brunctte, in the same class, dates back for some years; so does J. B. Bryant, also heavy red, sent out in 1874. This was raised at Huntingdon by the late Mr. John Ingram, though it does not rank nearly so high as J. B. Bryant and John Smith. Heavy purple-edge Zerlina, one of the late Mr. Robert Lord's seedlings, was sent out in 1876, and still holds a high position in its class. Heavy rose-edged Edith d'Ombrain was raised at Slough, and sent out in 1873; but it is now surpassed by such varieties as Little Phil, Mrs. Payne, Mrs. Sharp, and Norman Carr; yet still grown, and has been seen this season in good character. Mrs. Payne, just mentioned, dates back to

There must be good constitutional vigour in these varieties to have held their own through, in some instances, so many years; they do it because they possess qualities of a high order of merit, and until they are eclipsed by others of superior merit, are in all likelihood to be grown for several years to come. R. D.

THE CEDARS, HARROW WEALD.

In the pretty and well-kept gardens of T. F. Blackwell, Esq., which take a prominent place among gardens round London for the excellence of its fruit and flower culture, the many specimens of Cattleya labiata Gaskelliana have well maintained the charactor of the variety for beauty and freeness of flower. Some years ago a number of freshly imported plants were obtained, and every year since has seen them forming the chief show in the Orchid-houses, and every year each specimen produces more flowers than it did the year before, thanks to the skilful management of Mr. J. Dinsmore, the gardener at The Cedars, who has for so many years successfully managed the gardens and other matters included in his duties. For some considerable time past, the end and part of the side of the centre stage has been filled with these charming, fragrant Cattleyas, some of them bearing a dozen or so large richly-coloured

blooms. A few plants of C. Mendeli are also with them, one white-petalled form being specially beau tiful; and about the house are well-flowered plants of Disa grandiffora, D. racemosa, Cochlioda vulcanica, Miltonia vexillaria, Epidendrum vitellinun, M. Roezli, Odontoglossum cirrosum, the pretty little O aspidorhinum, Dendrobium chrysanthum, and other bendrobes, &c.; while at the back rises a tall spike of the Dove Orchid (Peristeria elata), which here thrives remarkably well. The Orchids are set up with Cocos Weddelliana, Caladium argyrites, Adiantum cuncatum, and the denser A. Pacetii; and these ornamental plants are conducive to the health of the Orchids, as well as to their more elegant arrangement.

In the stove-houses are large specimens of Ixoras in bloom: Tabernæmentana coronaria flore-pleno, plentifully covered with flowers like small Gardenias; Gardenia florida, and other flowering plants in great beauty; while the roof is laden with heavy trusses of golden Allamandas, rose-coloured Dipladenias, and white Stephanotis.

The lesser houses for decorative plants have good batches of Tuberoses; a fine show of a splendid strain of Gloxinias—the third and last batch for the year; a nice lot of the now-favourite Streptocarpus; a fine lot of Calanthes, for winter flowering; a pretty and useful lot of Dracenas and Crotons, among the latter being Croton Ruddii, with large foliage almost of the size and form of Ficus elastica, but brilliantly coloured green, white and red.

The handsome conservatory, built to harmonise with the mansion, has the exterior stone-work closely covered with Ampelopsis tricuspidata, which is always pretty when in leaf, and later in the year will be brilliant in its vinous red lines. The interior has the centre of tall Palms and Tree Ferns, fronted with Lalies, Vallota purpurea, &c. ; the side stages being arranged with a charming selection of flowers, In the back are many tall and graceful specimens of the yellow Crocosma aurea, a very fino plant for the conservatory. The corners are occupied by two show specimens of Statice profusa, a mass of bright blue colour above clear green leaves; and around are splendidly-grown tuberous Begonias, Achimenes, &c. In furnishing the conservatory, Mr. Dinsmore aims to make an arrangement of plantswhich will bear close inspection-and so dispose the plants that each one can be seen. In many places the contrary is the rule, and large quantities of very unsightly plants are crammed together, that the one may hide the defects of the other, and when at its best such an arrangement is a sorry affair.

The old-fashioned bedding-out is not much affected at The Cedars, though in the garden outside the conservatory there is a pretty arrangement with a large bed in the centre, bearing a vase filled with Dracæna australis and some flowering plants. Around it is a belt of flowering Cannas, then a band of white Marguerites mixed with blue Salvia patens, which looks very pretty; and then dark Coleus, white Violas, and Echeverias. Of the other beds, some of the prettiest are two of scarlet Begonias, mingled with yellow Violas, and two of variegated Pelargonium Flower of Spring, mingled with dark blue Viola.

Running beside the flower garden is the herbaceous border, covered with flowers on the Pentstemons, Gladiolus, Phloxes, Gaillardias, and other summer flowering plants. At the back the Caetus Dahlias are beginning to bloom, and among the dwarf plants in front, one of the prettiest is Nemesia strumosa.

Passing the great beds of Rhododendrons, which this year have had to be liberally watered in order to assist the plants to make up their buds for next season, is the rosary, and walking beneath the large Cedars, we come to what is called The Wilderness, and which is certainly one of the most interesting and enjoyable parts of the outdoor garden. It was formerly rough ground, but Mr. Dinsmore has transformed it into a charming natural garden with grassy glades and winding walks; rustic arrangements for Ferns and climbers, and generally for the reception of any number of handsome shrubs and perennials, which will in a measure take care

of themselves. These are supplemented with annuals for making summer show, and the effect is admirable even this year, when the heat has been so trying. Here the Golden Elder is very effective, the different species of Spireas pretty; the Hollyhocks, Dahlias, and other strong growing flowers quite in their proper places, with their unconventional surroundings; and the Godetias, Salpiglossis, Coreopsis, and other annuals very brilliant. Where possible, the original inhabitant, the Bracken, is retained as an undergrowth, and it has a very cool and pleasing effect. On one side are some large Camellias planted out, and of which some flower well

EUCHARIS PLANTS BEARING THEIR THIRD CROP OF FLOWERS.

In fig. 33 is represented a collection of Eucharis plants growing in the gardens of Mrs. Miller Brentry, Westbury-on-Trim. The photograph was taken in November last, and at that time the plants were producing a crop of flowers for the third time during the year. Upon twenty-two plants were produced about 1,000 flowers. A good example is this of the extraordinary fluriferous nature of this popular flowering plant. As there were three distinct lots of flowers in the year, the gardener, Mr. Osman, had no doubt

FORESTRY.

NORTH AMERICAN CONIFERS IN GERMANY.

However backwird we may be as a nation in forestry, we can still hold our own in arboricultural matters. The truth of this assertion is the more convincing when we find English trees and introductions referred to in foreign literature. An instance of this may be found in a controver-y which has been going on for some time in Germany between Herr Booth, of the Flottbeck Nurseries, Hamburg, and several high authorities on forestry and forest science.

Fig. 33, -eucharis plants at brentry gardens. Bearing their third crop of flowers.

out-of-doors; and at the other is a charming nook composed of the remnant of the old orchard, the fine old trees in which, although of little use for fruit, are grand objects when in bloom.

Frints under glass have been generally gool. The Grapes in the new range, notwithstanding the fact that the heat of the sun has destroyed most of the foliage, have never been better; the Muscut of Alexandria, Madresfield Court, and Black Hambro, planted in 1890, bearing fine crops of binches which would figure well on an exhibition stand. The Peaches and Nectarines, both indoors and out, have been, and still are, gool; the Melons are excellent in quantity and quality; and the Pine-pit, although Pines are not very extensively grown, is giving some excellent finit.

given the plants an enforce I rest on more than one occasion, it may be by partially drying-off the roots, or merely by subjecting the plants to a reduced temperature. The former method is a dangerous one if pushed too far, and if the Eucharis is to be restel at all in the manner we are speaking of, the better plan is to reduce the temperature a little, and at the same time to give less water, avoiling extremes in either limitation. By alternate resting and growing more flowers can be obtained in a given time, and they can be hid at certain dates in some measure at the will of the cultivator, but we have had occasion to remark that many collections so treated have fallen a prey to debility and disease. It is from this reason that many growers at the mesent time keep their plants in a moderate state of growth throughout the year.

Probably no greater advocate for the trial and planting of exotic trees can be found in Germany than Mr. Booth, and his efforts have been so far successful as to have been the means of numerous experimental clumps of introduced trees being planted in the State forests throughout that country. Many forest authorities in Germany, however, contend that the rapid growth of these trees in Europe minimises their value as first class timber producers, and that from a purely economic point of view, they are little, if at all, superior to Europe in trees. The difference of opinion on this point is not, however, confined to Germany, and an article by Forst-assessor Bohm of Eberswalde, on an investigation on the quality of the wood

[·] Zeitschrift for Forst und Jogdwesen for July.

of these German grown trees, together with some samples of Donglas Fir grown in England, are of interest to those who regard these trees as the timber producers of the future. In his examination of the European-grown woods, Herr Bohm compares them with specimens taken from trees cut in the natural forests of North America, where naturally the conditions of growth are slightly different to those under which the other- (probably specimen trees) were grown. This fact minimises the value of the results considerably, for nothing alters the quality of timber more than these ever-varying conditions of growth. The great difference in the quality of the American and that of the European-grown woods now under discussion, lies in the narrow annual rings of the former as compared with the broad-ringed wood of the latter. For certain qualities, such as specific weight, transverse strength, and general durability of the wood, the actual breadth of the wood-ring is of less importance than the relative breadths of its spring and summer zones. The broader the latter zone is, the higher are the above-named qualities in a particular ring, but as a tree truck consists of a considerable number of annual rings, the quality of its wood depends upon their uniformity in this respect throughout the tree. For certain purposes, such as joinery work, this uniformity of texture is of the highest importance, and in practice, it has long been recognized that only narrow-ringed wood is suitable for this kind of work. Freedom from knots is a desideration whatever the purpose may be for which the timber is used, and both this and the production of narrow-ringed wood is only attainable in quick-growing trees by a crowded condition of growth. Where strength and durability are the most important qualities, however, narrow-rings are of less consequence, and as building and estate timber generally, there is no good reason why these North American trees should not be as valuable as indigenous species The species dealt with in the article, are those of which the experimental elumps referred to have been formed; and the Douglas Fir stands first on the list. The total area occupied by this tree extends to 1442 hectares, or over 350 acres, and so far, it is the most promising species of any that were tried. The wood is described by Sargent as "hard and firm, but varying greatly in density and quality, and also in the proportion of heart-wood to sap-wood, according to the condition of growth. The lumberman recognizes two varieties, know as 'red' and 'yellow' fir, which probably arise from the age of the tree, the former being coarse fibred and dark in colour, and not so highly valued as the yellow Fir." Mean specific weight is given as 5157.

So far as this last-named factor goes, the European examples are quite as heavy as those from America, with the exception of the English-grown sections. The specimens of these latter show very broad rings, with little summer wood in them, and their specific weights are lower than any of the other sections mentioned. The locality from which they were taken is not stated, but, in any ease, they cannot be considered typical specimens of plantationgrown trees, which alone are of use in this connection. So far as the development of the summerwood zone is concerned, we have seen trees in which the annual rings were composed almost entirely of summer wood (an example of which accompanies this communication), proving that in this respect English-grown wood, under favourable conditions, is quite equal to that grown elsewhere.

While Herr Bohm considers that only narrowringed wood can come up to the required standard for the finer kinds of work; he allows that the wood of this tree is, compared with the Scots Pine, closer in grain, of finer texture, and takes on a better polish than the latter, and is possibly stronger and more durable, which qualities are by no means to be despised. A. C. F.

(To be continued.)

MR. REDFIELD'S HERBARIUM.—In our note on p. 102, upon Mr. REDFIELD'S Herbarium, we should have stated that the sum asked for it is 2000 dollars, and for the Fern collection 500 dollars. Owing to a clerical error, the dollars were represented as pounds.

THE ROSARY.

NEW HYBRID TEA ROSE, MARJORIE.

SINCE the appearance of my article on Hybrid Teas in the Gardeners' Chronicle, this beautiful new variety, raised by Messrs. Alexander Dickson & Sons of Newtownards, has come into bloom. Its colour is as impressive as that of its sister Rose, Margaret Dickson, which it strikingly resembles from this special point of view. The flower, however, while equally attractive, is not so large, but has the advantage of being fuller in the centre, and more compact. The plant is also of considerably dwarfer habit, which I cannot but consider a great advantage, and produces a flower like White Lady, another Rose possessing similar attributes at the end of every shoot. It is nuquestionably an exquisite addition to the rapidlygrowing race of Hybrid Teas. If mere size were not so vastly over-estimated, it would be an admirable Rose for exhibition, David R. Williamson.

TREES AND SHRUBS.

EUCRYPHIA PINNATIFIDA.

This South Chilian shrub, introduced some few years since by Messrs. Jas. Veitch & Sons, is now flowering freely here, as it has done for several years past in succession. The flowers are white, but otherwise resemble Hypericum ealycinum in form and size. The habit of the plant, however, is quite different, the specimen here being upwards of 6 feet in height and 3 feet in diameter. It is growing in a sheltered position here, but from the manner in which it passed through the severe frost of January and February, 1895, I cannot consider it by any means a tender plant. The foliage is distinct and attractive at all times. W. H. Divers, Belvoir Castle Gardens, Grantham. [See Fig. in Gardeners' Chroniele, Jan. 27, 1894, and August 22, 1891.]

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

MEXICAN-HOUSE.—In the division devoted principally to Mexican species, such plants as Laclia anceps, L. ablida, L. autumnalis, L. rubescens, L. purpurata, L. acuminata. Cattleya speciosissima, C. Skioneri, C. Walkeriana, Epidendrum nemorale, E. atropurpureum (macroehilum), Odontoglossum citrosmum, Vanda teres, Luisias, &c., should be making considerable progress in their growth, and should receive plenty of water at the root. If these plants have only a small quantity of material in which to root, a good syringing overhead, if given during the afternoon of sunny days, will be very helpful to them. Such species delight in a strong light and abundance of sun-heat at this period, and the house may be closed early, the blinds being drawn up at the same time, in order that the temperature may rise to 80 or 90°. During the evening the lower ventilations should be gradually increased, and on mild nights they may be left entirely open; ventilate freely through the early part of the day, plenty of fresh air being very essential to them.

EAST INDIAN-HOUSE.—The majority of Cypripediums being in full growth, afford them abundance of water at the root. Shade from strong sunshine, or the leaves will soon assume a sickly hue. Some species, as for instance C. Schlimi, C. superbiens, and C. Fairicanum, resent the least amount of sunshine, and it is well always to place a piece of tissue paper above them whenever the blinds are removed. The same species suffer greatly if they become dry at the root. All hybrids of C. Fairicanum, including C. Arthurianum, C. Juno, C. Niobe, C. H. Ballantine, and C. vexillarium, need the same treatment.

INTERMEDIATE-HOUSE.—The Sobralias have been one of the principal attractions in the Orchid-house for several weeks past. S. macrantha, S. xantholeuca, S. Lucasiana, S. Princess May, S. leucoxantha, S. albo-violacet, the white S. Illiastrum, S. Warscewiczii, S. virginalis, S. macrantha alba Kienastiana, and the pretty hybrid, S. Veitchii, are all deserving of culture, and they produce a long succession of handsome flowers at a season when Orchid

blooms are few. Sobralias being strong-rooting plants should be given plenty of pot room, but it is not always advisable to re-pot them immediately they have filled their pots with roots, providing there is sufficient space for the young growths to come up freely. Plauts that appear to require a larger pot may be given a liberal shift as soou as flowering is pa t. Afford good drainage, and pot firmly, using a compost consisting of rough fibry peat and sandy loam, and a small quantity of sphagoum-moss. After re-potting, water the plants with care, and when well-established, and the growths are vigorous. they will require an abundance. It is too early yet to remove the shoots that have just flowered; they should be left until the commencement of the winter months. The lightest portion of the intermediatehouse suits Sobralias throughout the year. elegant Platyelinis (Dendroehilum) filiformis is now flowering from its half-grown breaks. At this time an abundance of water must be given at the root, otherwise the growths will receive a check, and redspider establish itself on the tender foliage. charming species roots freely in well-drained peat and

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

SUMMER PRUNING .-- Continue the pruning of pyramid, espalier, bush, and cordon trained trees of Apples, Pears, and Plums, leaving sufficient shoots for extension, and for replacing worn out branches, on espaliers, and cordons. Remove any extra gross growing shoots, also others, if they are too thickly placed, and shorten all the remaining laterals to five or six leaves. Short sturdy growths, of 4 to 6 inches long, usually produce a fruit bud in the point of the shoot, and should be left intact. Those varieties of Apples mentioned on p. 760, vol. xix., which produce fruit at the point of the preceding year's growth, will require the old fruiting-wood and the weakly growths to be cut out, after the fruit has been removed from the trees. But no stopping should be done. In the case of young trees trained as pyramids or bushes, it will be necessary to leave a few new growths, for forming additional branches. A great difference may be seen in the habit of varieties, and there can be no hard and fast line, as to the exact distance that should be allowed between the branches. The end to have in view is that when the branches are covered with spurs there may be a free circulation of air amongst them, and that the rays of the sun may be able to reach the ground through the trees. As a general rule, which may be modified in cases of extra weak or unusually stronggrowing varieties, when main branches exceed 2 feet from each other, secure a young shoot for forming another branch. Young trees of Apples and Pears another branch. Young trees of Apples and Pears trained as standards require similar treatment in regard to the formation of new branches. Prune the laterals back to five or six leaves for forming fruitspurs, and leave the leading shoots intact until the winter. A perfect standard tree is well balanced, its branches evenly distributed, and covered their whole length with short healthy fruit-spurs.

In gardens where there have been no heavy rains recently, all fruit-trees bearing crops should be given copions supplies of water at the root. The Apple crop is not a large one, therefore it is important that trees carrying many fruits should be well attended to.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

EVERGREEN TREES AND SHRUBS.—It will be safe, shortly, to proceed with the transplantation of shribs or evergreen trees, particularly if the wea-ther he moist. In eases where this kind of work is likely to be extensive, advantage has to be taken of the first favourable opportunity to commence. The early-lifted trees will then become partly established before the advent of winter. Trees that are to occupy shady positions should first be moved, as these will require less watering at the root and overhead afterward, and when these are done, cooler weather is likely to obtain; but in any case early lifted trees will require the soil about the roots to be kept in a perfectly moist condition. Evergreens may yet be pruned if this is necessary. If the gardener wishes to increase his own stock of Aucubas and other Evergreens, cuttings may now be put in, but we think it better to obtain them from a nurseryman who makes a speciality of such things. Should cold frames be unobtainable for the purpose, the cuttings can be planted in a slady position out-of-doors. Put them moderately close together in rows or narrow

beds as is most convenient, and afterwards make the soil firm round about them. If the soil is not sufficiently moist, a good soaking of water should be given.

FLOWER-BEDS AND BORDERS from which cuttings are being removed, should be disfigured by gaps as little as possible. Remove all seed-pods or decaying leaves and stems. The out or peg down growths not required to be taken, and keep the beds in as good condition as possible.

GRAVEL WALKS AND DRIVES, ETC., will require to be rolled on every favourable occasion, and it weeds are showing, hoeing or other convenient methods for their destruction should be taken without delay. Mow grass walks and lawns, and trim the verges of same as often as is needful.

HERBACEOUS BORDERS.—Sunflowers, Phloxes, Scabious, Chrysanthemum maximum, Campanulas, Geums, and many other species of plants, are now producing a wealth of blossom in these borders, and in order to keep the plants in good condition, they must receive thorough waterings should the supply of rain be insufficient. Eryngiums (Sea Hollies) have again proved how well able they are to withstand severe drought. Most of the varieties are worthy of cultivation, but E. Oliverianum, E. amethystinum, and E. giganteum are the best, the last named are most effective if planted in groups, the bold foliage and pale grey heads of flower being then shown to advantage.

BEGONIA WORTHIANA is one of the very best for bedding-out purposes. It has been gay the greater part of the season, and if the stock is of limited extent, it should be increased. Take off any side-growths, and insert them in light or sandy soil in pans or pots. Place them in a gentle heat, and they will soon form small bulbs at the ends of the shoots. They may be kept growing the greater part of the winter, and should furnish excellent plants for bedding-out next season. Apart from its pleasing colour, the variety has a charming appearance, possessed by few other Begonias now in cultivation, and for pots or beds it cannot be too highly recommended, being in no way fastidious as to the soil or position in which it is grown.

THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Dropmore, Muldenhead,

CAULIFLOWERS.—Seeds should be sown about the middle and towards the end of the month to furnish plants for stinding through the winter in frames and handlights to be planted out next spring. If two sowings be made at different dates so much the better. Although in some gardens the sowing of Cauliflower seed in autumn has been discontinued since the introduction of the early forcing varieties for spring sowing. I prefer to sow a quantity in the autumn, for if handlights and frames are available through the winter, the labour arising from this method is really less than from early spring sowing. Select an open position in the garden for sowing the seeds, and one where the soil is in good condition and there is no fresh manure required. Sow the seeds thinly, and by preference in drills about 9 inches apart. Good varieties for sowing now are Early London and the dwarf Erfort Mammoth, and if space for wintering is forthcoming, a few seeds may also be sown of Eclipse and Autumn Giant; they will afford a useful succession to the preceding varieties.

PARSLEY.—The weather has been much against the well-doing of this herb, and to encourage growth, watering has been very necessary. The present is a suitable time to lift a number of roots and dibble them into boxes of soil to reserve for winter use. Boxes about 18 inches square and 6 inches deep are a useful size for placing later in Peach or other houses. Put a good layer of half rotten leaves in the bottom of the boxes, and fill up firmly with any moderately good soil. Lift the plants with care after they have been watered, and re-plant them about 3 inches apart in the boxes. The boxes may be placed in a shady position until the plants are partially established, but afterwards give them full exposure until severe weather sets in. A quantity of plants should also be transplanted into frames, if any are available, but first fill them to within 8 inches of the top with soil. The lights should be left off for the present, but afford a little shade until the plants are re-established.

CUCUMBERS.—If plants are required for planting in heated pits or houses for autumn and winter use, seeds of a good variety, such as Tele-

graph, should be sown forthwith. Sow the seed singly in 4½-inch pots, which may be filled two-thirds full of soil, the remaining space, with the exception that room for watering be left, to be filled up as soon as the plants need additional soil. To plants now fruiting, attention should be given frequently to the stopping and thinning out of superfluous growths. Owing to the hot weather that has prevailed, Cucumbers have made rapid growth, and for some time have been fruiting freely. The fruits should be removed from the plants directly they are large enough.

MUSHROOMS.—It is time that preparations for the formation of early be is should be made. Shake out the droppings from the stables every two or three days, together with the shortest strawy litter, and if it is very dry afford a slight watering through a moderately fine-rosed can. Turn the manure over about every other day until the heat has become molerate. The first bed may be made up in some shady position out-of-doors. If any old beds still remain in the Mushroom-house have them removed, thoroughly cleanse with a brush the inside of the structure. Allow the door and ventilator to remain open and when quite dry, the walls should be line-washed and the woodwork painted.

PLANTS UNDER GLASS.

By JNO. McINTYRE, Gardener, Woodside, Darlington.

BOUVARDIAS.—Continue to stop the shoots of Bouvardias, in order to obtain bushy plants; and if the plants are in pots, and the pots plunged, they should be turned round every three weeks, so as to prevent the roots from taking a firm hold of the plunging material. Give liquid-manure from the farmyard on two occasions can have.

MIGNONETTE.—Sow seeds of Mignonette in pots for blooming next spring. We sow in the same pots in which the plants are to flower. These are 4 inches and 5 inches in diameter, and a compost is used containing good loam, dried cow manure, and old lime-rubbish, in equal parts. The variety best suited for pot-culture is Matchet, which is dwarf in habit, and capible of producing fine heads of bloom. When the seed has been sown, place in a cold frame, but keep the top-lights off for the present, unless when heavy rains occur.

TREE CARNATIONS. - West specimens have almost finished flowering, and if it is desired to increase the stock plant them out where they may be shaled from the hot sun. Layers made now should bloom in April, May, and June maxt. If large specimens are wished report some of the plants now passing out of flower into good loam which is free from wireworm, and add a little broken charcoat and wood ashes. Tyered early should now be ready for potting-up; when this has been done plunge them to the rims of pots in leaf-mould, the roots will thus be protected from hot san, and they will draw natural moisture from the plunging material. If layers are rooted, as they should be before being removed from the parent plant, they may be at once put into the pots in which they are to flower. For the first souson 5-unch and 6-inch pots are suitable. Careful crocking is most essential, as no plant is sooner injured by stagnation of water in the soil than Carnations. When layers have been potted up, they should at no time be given water, unless the plants really require it. A rather close atmosphere for some days after potting should be kept, and the plants sprayed overhead at least once a day. Afterwards increase the ventilation gradually until fully exposed. Careful attention should now be given to the plants intended for winter and spring blooming.

POINSETTIAS are almost universally grown; the magnificent scarlet bracts being so useful through the winter months. A house should be deveted to them, if possible; a low span roofed structure is best, but it must be provided with sufficient piping to maintain the temperature of the house at 65° at nights, until the plants are ready for removal to the show-houses. As soon as the plants are well rooted, feeding may be commenced. Sheep liquid prepared from sheep-dung is one of the best.

THE FERNERY ought now to be very attractive. A late batch of Selaginellas may still be propagated; they will be useful for furnishing late in the autumn. It is rather late for re-potting Ferns, but any special plant that may require to be grown on rapidly may be potted. Dense shading may now be dispensed with for the season, but be careful to remove it gradually. As soon as a Fern shows signs of cessation from growth a less quantity of water should be given it; roots as

well as fronds become less active. All syringing overhead may soon be discontinued.

GENERAL WORK.—Continue to take cuttings of stove plants as required; those propagated now will make nice plants next season. Eucharis which flowered in the spring and have now completed their growth may be moved into a cool-house for three or four weeks; if they be then returned to heat, they may bloom in September, and by allowing part of the plants to rem in longer at rest, a succession of blooms may be had throughout the winter. A thorough rest when they have finished their growth is very essential to the successful flowering of the Eucharis.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Custle, Newbury.

PEACHES AND NECTARINES.—If there are any new houses to be planted, or any trees to be lifted and replanted in the older structures, preparations for the work should be commenced at once. The compost necessary for making new borders, or for renovating old ones, and for placing about the roots of lifted trees, is one of the chief requirements, and should be ready before any lifting is done. Large trees that may not have been lifted for some years, but are disposed to make too much late growth, require to be prepared for the operation of lifting, by taking out a trench around each tree at the distance of 5 or 6 feet from the stem, according to the size and height of the branches. After severing the roots extending beyond this, the trench may be again filled in until transplanting takes place, which may be done about the middle of September, or as soon as the foliage of the trees gives signs of falling. Where the staple soil is fairly good, and the drainage satisfactory, as it sometimes is on a gravel or sandy subsoil, it may not be necessary to form entirely new borders. A free addition of chalk or lime and mortar-rubbish, if the natural soil be deficient in calcareous matter, or a good dressing of findly-rubbished all references. good dressing of finely-pulverised clay if the soil be too light and sandy, would be all that is required in such a case. But if the subsoil is cold and wet, it must be efficiently drained, or the results will be but poor. Provide a layer of conwill be but poor. crete over the bottom, with a slope to the front, and upon these place proper drains, connected with an outlet to carry off the surplus-water. Upon this 2 inches to a foot of rubble should be placed, the roughest at the bottom, and finishing off with 2 or 3 inches of old mortar-rubbish, which will prevent the soil falling into the rough material. Deep borders are not desirable, 2 feet of soil being ample. Good early sorts are Alexander, Hales' Early, Early Louise, Stirling Castle, Early York, and Early Grosse Mignonne; and of Nectarines, Cardinal, Rivers' Early, and Lord Napier, are the best earlies.

VINES, EARLY HOUSES. -Any lateral growths may have been allowed to extend on these should be shortened, but not yet taken off closely, as this would probably have the effect of causing some of the principal buds to start into growth. The old surface-soil should now be removed down to the roots, and any that are too deep should be raised at the same time, and laid out in fresh material nearer the surface. Procure some good calcareons loam for this if possible, and add a little crushed bone, woodashes, and charcoil. If too stiff, some old mortarrubbish may also be added; or if of too light a nature, mix in a due proportion of finely-pulverised marlyclay. As soon as the operation is completed, give a moderate watering, and the roots will commence to push into the new soil at once. This practice carried out yearly, will soon induce a healthy lot of roots near the surface, and the Vines will be correspondingly benefited.

SAUCE FOR THE GOOSE, ETC.—Since the publication in these columns of the report of a law case in Belgium, p. 42, we have received communications from some of our nurserymen complaining that whilst purchasers expect the nurserymen to revoke the bargain or to make compensation if a plant bought turns out to be something different from what was anticipated, purchasers are not so eager to compensate the trader when the plant purchased turns out better than was expected! Several cases have been cited to us where the plant proved to be of very much higher value than originally supposed, but the purchaser thinks that a piece of good luck, and never thinks of a mensating the dealer in such a case!

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

MONDAY, Aug. 17—Felling Horticultural (two days).

WEDNESDAY, Aug. 19 Shrewsbury Floral Fête (two days):
Trowbridge, Worthing, and Eastburne Horticultural Shows.

THURSDAY, Aug. 20—Abingdon Horticultural.

FRIDAY, Aug. 21 lace (two days).
Devon and Exeter Horticultural Shows.
Royal Horticultural Society of Aberdeen Show.

Co-operative Show at Crystal Pa-

SATURDAY, Aug. 22 South Manchester and District Horticultural Show.

SALES.

MONDAY, Aug. 17 | First Special Trade Sale of Dutch Bulbs, & 50,000 Double Patfoldis, at Protheroe & Morris' Rooms.

THURSDAY, Aug. 20 | Second Special Trade Sale of Intention Bulbs, at Protheroe & Morris' Rooms.

FRIDAY, Aug. 21 | Sale of Imported and Established Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -61.8.

Mr. Burbank's work as a hybridiser. THE appearance at the Royal Horticultural Society recently of an entirely new variety of Plum gives us an opportunity for

which we have long been waiting of saying something about its originator or introducer. We should have done so long ago, but that Mr. Burbank expressly says his catalogue is not for public distribution, and seems to deprecate rather than to court publicity. If a copy of his list should fall into the hands of an editor, he begs that the list be not mentioned, unless incidentally. The reason for this reticence is, that he believes he "would be overwhelmed with an avalanche of correspondence."

Mr. Burbank has devoted himself for many years to raising, hybridising, and cross-breeding on a gigantic scale. He talks of "600,000 hybrid and cross-bred seedling berry-plants, of more than half-a-million seedling Lilies, and of other things in proportion. He does not introduce these plants himself into commerce, but he circulates his catalogne among nnrserymen (not among the public), and the nurserymen or their agents visit his grounds at certain seasons, select what they please, purchase the entire stock, and leave Mr. BURBANK free to make other experiments, or supervise the products of former trials. Casual visitors are not enconraged in the nurseries, which are situate at San Rosa, California; but those who do go will not, we are told, find long rows of beautiful plants, but "chaos, utter chaos, a workshop, the birthplace of new vegetable One of his workmen is reported to have said, when asked if he knew Burbank, "Conrse I do . . . he raises acres and acres of stuff, and every snmmer has 'em all dug up and burned."

It is only the unpromising stuff, however, that is burned, but nothing is propagated that is not deemed at least equal to the best, and better, in some particulars. The statements made as to the number and variety of Mr. Burbank's productions are so astounding, that some might be disposed to consider them as so many flowers of rhetoric, such as we are accustomed to from the other side of the Atlantic, were they not authenticated by competent observers of established repute.

A double Gladiolus is one of Mr. BURBANK's novelties; and in the catalogue before us there are Clematis, Myrtles, Poppies, Nicotiana, Tomatos, Tigridias, Cannas, Brodiæas. "There is," says Mr. BURBANK, who writes as an enthusiast tlushed with his successes, "no barrier to obtaining fruits of any size, form, or flavour desired, and none to producing plants and flowers of any form, colour or fragrance; all that is needed is knowledge to guide our efforts in the right direction, undeviating patience, and cultivated eyes to detect variations of value." This statement may be true as a general principle, but there are a great many exceptions in practice, and the knowledge we shall get in time will serve to show where and what are the limitations. In the meantime, Mr. Burbank's experiments are of the greatest practical importance, and should also possess high scientific value. Probably, the results are far too numerous to permit him to record them. analyse, or co-ordinate them in the way we should like to see. Yet, perhaps, a single group, say of Rubus or Prunus, might be dealt with in this way; or the material might be placed in the hands of the directors of some of the experiment stations to work up, leaving the commercial part of the business to be directed by Mr. Burbank himself.

The Burbank Plum, fig. 34, p. 191, is one of which we have heard a good deal, but which we have had no opportunity of seeing till it was exhibited by Mr. McIndoe. It is, we believe, of Japanese origin and very unlike any of our ordinary Plums in habit and foliage. It is very prolific and bears numerous fruits from the eld wood. The fruit is yellow, but we can give no opinion as to its flavour, nor say anything about the stone, which, as our readers are aware, furnishes distinctive characters of value.

MR. ALFRED BENNETT'S two The Flora volumes, published under this of the Alps. title by NIMMO, King William Street, Strand, will be valued by tourists and others desirous of obtaining an acquaintance with the plants they are likely to meet with, and will be serviceable as a catalogue to collectors and cultivators. "Every species of flowering plant which is reported by competent authorities as growing wild in Switzerland is at least named, and a short description given of all except the commonest English plants, which are familiar to everyone interested in our wild flowers.

"As the traveller with botanical tastes approaches Switzerland by any of the ordinary routes through northern and eastern France, he notes but little difference in the vegetation from that with which he is familiar in our southern counties. A few strangers soon make their appearance; the spiny heads of Eryngium campestre are seen by the roadsides, and the damp meadows are coloured by the yellow Thistle (Cirsium oleraceum). In the vineyards he would also find some unfamiliar weeds, such as various species of Delphinium. But until he reaches Macon or Pontarlier the general aspects of the vegetation are the same; it is the flora of north-western Europe. In the mountain woods of the French Jura, or of the northern cantous of Switzerland, he will come across much more to attract his attention; such plants as Veronica urticafolia, Prenanthes purpurea, and Astrantia minor meet him everywhere; Prunella grandiflora is common by the roadsides; species of Dianthus and Gentiana become gradually more predominant; while among the bushes by the roadsides or in damp meadows he will notice the red-berried Elder, Sambucus racemosa, and the feithery Spiraea Arancus. The sylvan flora of the calcareous Jura

chain is especially interesting; here are found in abundance the alpine Honeysuckle, Louicera alpigena, with its twin red berries; the Mezereon, the weird herb, Paris - Paris quadrifolia, the pretty little Maianthemum bifolium, the red-berried Crowberry, more than one species of Phyteuma, and many another which the inexperienced botanist will transfer with delight to his vasculum. But none of these are truly alpiue plants, and it is not till be ascends much nearer to the eternal snows that the full glories of the alpine flora hurst upon him; the Rhododendrons, the azure of the innumerable Gentians, the star-like Saxifrages, white, yellow, and purple; the many-hued Anemones, the feathery heads and silvery leaves of Dryas octopetala, the Primulas, the Sempervivums, with their webbed leaves and singular blossoms, and multitudes of others. Even to those who do not claim to be botanists it is a day to remember when the Edelweiss or the [wild] Auricula is first gathered in its native haunt, or the tisselled bell of the Soldanella or Snowbell is first seen appearing through the edge of

North of the Alps the flora is essentially that of north-western Europe. South of the Alps it is essentially that of the Mediterranean, the great range of snow-clad peaks preventing any great migration of southern plants north-wards, or of northern plants southwards. But a certain degree of intermixture of alpine and of southern floras does take place, of which examples may be found along the Rhone Valley.

The chief element in the British flora which would be strange to a Swiss botanist is the Lusitanian one, but that is scanty in point of numbers, and confined to the extreme south-west of England and of Ireland. "So accustomed," says Mr. Bennett, "are we to the glories of our gorse commons, and of our bills clad with purple heather, that we can scarcely believe how limited is the range of these plants, and it is only gradually that the English botanist visiting Switzerland begins to realise that in her woods there are no Blue-bells, on her banks no purple Foxgloves; that the Gerse and the Broom are hardly ever seen; that in her Corn-fields are no Cern-marigolds; and that from her mountain-sides our Bell-heathers are entirely absent.

The origin of the alpine flora is a matter not yet settled to the satisfaction of philosophers. A migration from the north, in consequence of glacial action, does not account for all the phenomena, for the flora, as a whole, more closely resembles that of the Asiatic Alps than it does that of Scandinavia. The only general conclusion arrived at is, in the words of Mr. Thiselton-Dyer, "that the alpine flora is a very ancient one, and probably a decaying survivor of one of which the extension was at some former time much more considerable."

Mr. Bennert discusses in his introduction the adaptations of s ructure and conformation undergone by the plant in its endeavours to maintain its existence under the circumstances in which it is placed, and in his grouping of species he does not strictly follow the indications of affinity, but puts together those species which are united by some conspicuous or easily recognised character, leaving the reader to seek the more important marks in botanical treatises to which his own may serve as introductory.

In his remarks on the cultivation of these plants, Mr. BENNETT quotes GRAF in saying that "the great object of the cultivation of alpine plants should be to reproduce as nearly as possible the conditions under which they grow in their native habitat."

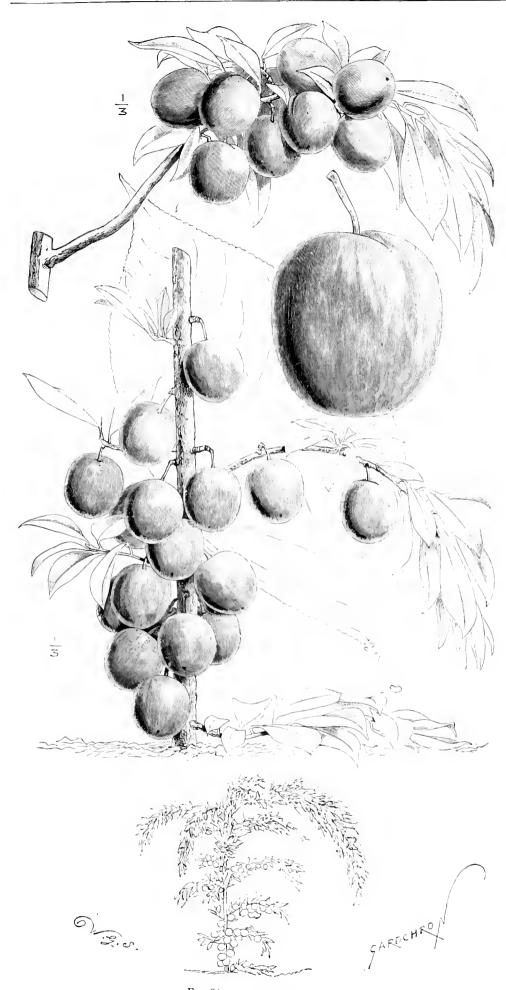

Fig. 34.—The Burbank Plum.
Fruit natural size, other parts reduced. (See p. 190.

This may be good in theory, but in practice it must be modified according to circumstances. We cannot reproduce alpine conditions in their entirety, and if we could, it is by no means certain that it would be desirable to do so. Plants have to grow where they can, not necessarily where the conditions are best suited to them, and, if some of them are found in alpine situations, it is not that the conditions there are specially favourable to them, but that those conditions are unfavourable to other plants, and hence there is less competition, and the struggle for existence between plant and plant is lessened. If it were not so we should not be able to grow in our lowlands and in our damp climate so many alpines as we do. Whilst, therefore, not overlooking the influence of the conditions under which plants grow in the Alps, or indeed in any other climate whatever, it behaves the gardener to study with even more attention the power and means of adaptation that the plant has at its disposal. This can be done by a careful study of the minute anatomy of the plant, but, of course, more particularly by careful observation and searching experiment.

It will be seen from what we have said that the book will be useful not only to tourists, but to cultivators, as it contains reference to most, if not all, of the plants generally designated "alpine," including those of Dauphiny and the Pyrenees. A list of the principal works consulted is added, but, singularly enough, no mention is made of Mr. Wooster's Alpine Plants, although some of the coloured illustrations have been adapted (e.g., Campanula linifolia) from that work, and the others taken without any change.

THE ROYAL HORTICULTURAL SOCIETY-The meeting of the Royal Horticultural Society on Tuesday last, if not so large as on some former occasions, was, at any rate, more extensive and interesting than could have been expected. The plan of placing the novelties and plants exhibited for certifixites on a separate table is an excellent innovation, for which we have to thank the new Superintendent It is a plan which adds greatly to the convenience of the experts, whilst it in no degree detracts from the appearance of the general exhibition. The most remarkable feature on this occasion was the group of hardy Bamboos exhibited by Messrs. Veitch, a very extensive and interesting exhibit. Mr. Cannell's moderately-sized and beautifully varied Cockscombs were also remarkable. For further details of this exhibition we must refer to another column, merely adding that Mr. DRUERY's lecture on the generation of Ferns, illustrated by lantern-slides, was very successful and instructive. It is currous to observe that the greatest amount of variation takes place in the vegetative organs. In the higher plants, on the contrary, if we wish to perpetuate a particular form, we rely on cuttings, grafts, rather than on seedlings, which are less constant.

A NURSERYMEN'S BEANFEAST.—On Monday, the 2rd inst., the heads of departments in the various nurseries of Messrs. Jas. Veitch & Soxs, and a few friends, enjoyed their annual holiday. company, numbering about fifty, assembled at 1 addington, where a saloon carriage was in waiting to take the party to Slough, which place was reached at 10.8 A.M. From Slough the company were driven in four large brakes to East Burnham Park, the country residence of Mr. HARRY J. VEITCH, whose hospitality was greatly appreciated. Afterwards a pleasant hour was spent in viewing the varied and extensive alterations and improvements that have been made in the gardens, and upon the estate generally. Before leaving this lovely spot, the company was photographed. The intimation that luncheon was to be served at Langley at two o'clock, and

that the drive thence was to be by the famous Burnham Beeches, and the pretty avenue through Dropmore Park, was received with pleasure, many of the party not having previously had an opportunity of seeing the stately demeste of Dropmore. The majestic Conifers, and large clumps of Rhododendrons, give this extensive park a unique charm. Langley having been reached, huncheon was partaken of under the presidency of Mr. HARRY J. VEITCH, after which the trial grounds were inspected, the seedling Orchids visited, tea partaken of, and a pleasant day brought to a happy ending.

CARNATION PESTS AT THE CAPE .-- We have received from the Agricultural Department of the Cape of Good Hope three specimens of diseases which affect Carnations at the Cape. One of these (No. 2) is well enough known in Europe under similar circumstances, and has often been alluded to in this journal under the name of Heterosporium echinulatum. It is one of the black moulds which attacks Carnations in Europe, and if dealt with at all it must be by the copper solutions, whilst all spotted leaves would be better removed and burnt. Another set of specimens appear to be those of Septoria Dranthi (No 1), in which the spots on the leaves are larger, thickened, and of tawny-yellow, inclining to reddish with age. The perithecia, like little black points, are visible on both surfaces beneath the cuticle. The sporules are elongated and curved, about 30 or 40 millemetres long, and not more than 4 broad, with an indistinct row of nuclei. This does not appear to differ much from the European type, and is also disfiguring and destructive. The third set of specimens (No. 3) are not so readily identified, as they support a parasite in an imperfect condition, that is to say, it is a Uredo, or the Uredosporous stage of some Uromyces or Puccinia, and probably the former. The pastules are small, bullate, and for a long time covered by the cuticle. It is probably the Uredo Dianthi of Persoon, which is held to be the Uredosporous condition of Uromyces. This is also a European pest, but by no means common, as far as our experience goes. In similar cases it has been affirmed that syringing with Condy's fluid has been of benefit, causing the pustules to blacken and fall away. Others recommend Bordeaux mixture or Emiceleste, but we doubt whether in such cases, where the parasite is an endophyte, and pervades the tissues before any external indication takes place, the application of fungicides will be of much service. In all three instances it is much safer to prevent the spreading of the pest by picking off all the diseased leaves, if practicable, and burning them, whilst syringing the standing plants so as to destroy any scattered spores. It is interesting to note the wide distribution of these pests, almost wherever their hosts are cultivated, and to ascertain that cultivators in remote parts of the world have to contend with the same difficulties which beset ourselves, M C. C.

NICHOLAS FUNCK. - A name well known in the history of botanical science has to be deleted from the list of living worthies. FUNCK and LINDEN, FUNCK and Schlin are well-known names in the literature of botany. Funck was the friend and companion of LINDEN in his remarkable explorations, made more than half a century ago in districts of tropical Anierica, at that time almost unknown. Funck accompanied Linden as an artist, and became his most zealous colleague in the search for and collection of objects of natural history. The two naturalists arrived in Rio de Janeiro on Christmas Eve, 1835, and sent thence large collections of botanical and zoological specimens, even now not all elaborated. Afterwards the two friends explored together many of the West Indies, Mexico, and northern Guatemala. On their return to Europe, Funck became one of the Manigers of the Zoological Gardens at Brussels, and subsequently became Director of the Zoological Garden at Cologne, a post he held for several years. On his retirement he returned to his native city, Luxemburgh, where he died at an advanced age on the 10th inst. He will be remembered as a learned, upright, loyal man, who won the sympathies of all who Monthly Meeting at Ghent.—On the occasion of the last meeting of the Chambre Syndicale des Horticulteurs Belges et Société Royale d'Agriculture et de Botanique, the following awards were made:—Certificates of Merit for Cattleya rex, to M. Jules Hyr (by acclamation); for Lilium auratum, Wittei, to M. A. Dallere; for Odontoglossum vexillarium superbum, to MM. Pourbaix Freres, of Mons. Awards for Cultivation and Flowering:—For two Gereus macrogonus, from M. E. Beinnehaus; for Chironia floribunda, from M. L. De Smetduviver. An Award for Cultivation was allotted to Maranta vittata, from the last-mentioned exhibitor, who obtained also Honourable Mention for Maranta regalis, and for Pandanus amaryllidifolius.

Wellingborough Dahlia Society.—This is a newly-formed society, and will hold its first exhibition at the Corn Exchange, Wellingborough, on Sept. 5. A modest, but representative schedule of prizes has been issued, and it also contains a few classes for Roses, fruit, and vegetables.—The secretary is Mr. W. Spragos, 29, Grove Street, Wellingborough.

STOCK-TAKING: JULY.—The increase there has been in the imports has not been maintained. During the month of July there was a decrease in the values (cub Board of Trade Returns) to the extent of £714,661; not much, one may say, but sufficient to indicate that, to some extent, politics in the United States, are having an unsettling effect. An equally disturbing item is to be found in our own harvest prospects. But the wreck of crops in southern Russia must not be overlooked. The following items are from the "summary" table of the imports for the nast month:—

IMPORTS.

	189%	1896,	Difference
Total value	£ 35,097,514	#E 1,082 × 70)	£ 711,661
(A) Articles of feel and drink duty free	13,650,262	11,862,507	1 187,975
(II) Articles of feed and drink dutieds	1,955,093	2,985,851	+129,70
Raw materials to textile manufactures	3,530,191	2,706,000	—7 to, 198
Raw neaterrals for sundry industries and numerators	4,795,777	5.106,149	+ (07,)
(A) Miscell means articles	1,103,739	1,164,-10	+61,971
(B.) Parcel Post	79,661	66,704	-43,160

The principal subjects of decrease are to be found in articles of tood and drink, duty free (£1,187,955); oils (£24,761); raw materials for textile manufactures (£7,65,498). The total imports for the first seven months of the year are in excess of those for the same period in last year by £12,040,421. The extracts from the general mass of figures bearing on fruits and vegetables are very interesting, as here shown:—

Imports,	1895.	18904	Difference	
Fruits, row —				
$\Lambda pph \sim$. Jaish	57,5865	100,252	± 455284
Chernes		€ii,01″	94,166	$\pm 24,119$
Phins	11	59,040	108,00%	+78,983
Peos .		(65,90%	75,001	+41.647
Grapes	,,	45,238	29,770	24 468
Unemmerated	.,	042,194	286,200	-55,994
Onnons	* *	367,942	5.15,591	52,018
Potatos	owt	700,882	100,511	894,071
Vegetaldes, rew, merated		£204,07a	€ 91,618	£9,411

Looking at the large totals attached to the two items of "unenumerated" fruit and vegetables, it certainly does seem a pity that the information is so seanty. Two articles of import are worth separate mention—"wood and timber"—and a product from the latter. The former stands for 203,245 loads, valued at 2595,087; the latter—wood-pulp—is represented by

 $35,\!379$ tons, valued at £175,437; malogany foots up 4586 tons, valued a £36,717.

The Returns relating to

EXPORTS

are satisfactory, though there was room for greater improvement. On a total for the month of £21,334,785, there is an increase of £775,299, as compared with the same period last year. The seven months just ended show a total of £140,337,507-or an increase of £13,660,505 over the same period in 1895—the only decrease to record for the latter period being £194,928 in raw materials. Of course the healthy harvest reports which have been published from time to time during the past month or two, have influenced the importation of food-a decrease is above noted amounting to £1,187,955. Therefore our exchange of both raw and manufactured materials is affected by our own good fortune, temporarily; when the actual quantity and value of our home crops are ascertained and those also of other nations then the usual process of adjustment will follow; and if there should be a falling off in exports there will assuredly be a rise in the value of boine trade.

THE PRESTON AND FULWOOD HORTICULTURAL SOCIETY held its annual meeting in the Prest n Town Hall on the 8th inst., Ald. W. H. Wood presiding. The Secretary (Mr. C. Parker) presented the balance-sheet for the year ending with the eighteenth spring show. These showed that the receipts amounted to £231–13s., and that after providing for all contingencies, there was a balance of £35–5s. to carry forward. Amongst the officers appointed were the following:—Mr. J. B. Dixon, Hon. Treasurer: and Mr. C. Parker, Secretary. It was decided that a programme for the winter session be drawn up by a sub-committee.

ARUNDEL, LITTLEHAMPTON, AND DISTRICT HORTICULTURAL SHOW.—The first annual show of this society was held on the 6th inst., in the grounds of Arundel Castle, the seat of his Grace the Duke of Norfolk. Several thousands of persons visited the display, which was a very creditable one. There were upwards of 800 entries. Handsome non-competitive groups came from his Grace the Duke of Norfolk, Lieut.-Col. Henty, Major Middleton, and C. J. Fletcher, Esq. Among the nurserymen, Messis. Cheal & Sons, Crawley, showed excellent Dahlias, &c.; and Miss McRonald some fine cut Roses and seedling Tree Camations.

THE SCOTTISH HORTICULTURAL ASSOCIATION held its August meeting on Tuesday last at Edinburgh, Mr. Todo occupying the chair. An interesting paper was given by Mr. Samuel Johnson. Kirkby Malton Hall, Kinckley, Leicester, entitled the "Evolutionary Theory and Plant Life." The paper excited a considerable amount of discussion from several members.

THE CHESTER [SHOW.-In the hurried report which appeared in our last issue, we omitted to mention a very meritorious collection of fruit exhibited by Mr. N. F. BARNLS, gardener to his Grace the Duke of Westminster, Eaton Hall. This consisted of thirty dishes of first-rate fruit, and included Madresfield Court Black Hamburgh, and Muscat of Alexandria Grapes, Triumph, Hero of Lockinge, and Little Heath Melons, Jargonelle, and Souvenir du Congres Pears, Transparent Gage, Jefferson, and Kirk's Plums. Pine-apple, and Lord Napier Nectarines, Royal George Peaches, Moor Park Apricots, Brown Turkey Figs. red and white Dutch Currants, Morello Cherries, and Duchess of Oldenburgh, and Worcester Pearmain Apples. It was tastefully staged, and the fruit was of an even description, and of good quality. We believe the idea of holding a great horticultural show in Chester in 1896 first suggested itself to Mr. Barnes. A collection of choice Conifers, &c., was staged in the lower end of the specimen plant tent, as well as outside, by Mr. Anthony Waterfr. Knaphill Nurvery, Woking. Messrs. John Cowan & Co., Liverpool, had an extensive exhibit of well-grown and tastefully-arranged Tea Roses in pots. This excellent exhibit was awarded a Silver Flora Medal by the deputation of the Royal Horticultural Society. Messrs. Dobbie & Co., Rothesay, made a fine display of Violas, Sweet Peas, and early-flowering Chrysanthemums, and were awarded a Silver-gilt Banksian Medal by the deputation of the Royal Horticultural Society.

NATIONAL CO-OPERATIVE FLOWER SHOW.—In connection with the eleventh annual flower show at the great National Co-operative Festival to be held at the Crystal Palace on August 21 and 22, there will be an exhibition of photographs, and other illustrations of suburban and rural gardens and scenery. The capabilities of photography as a means of illustrating sylvan and garden scenes, and bringing out the gradations of light and shade, will be strikingly illustrated.

FORMALDEHYDE. - An inquiry in our last issue induces us to extract the following particulars from the report of the British Pharmaceutical Conference as given in the last number of the Pharmaceutical Journal. "Formaldehyde (said Mr. BIRD) is an exceedingly powerful antisentic, and at first sight appears to be one which should prove exceptionally valuable in certain pharmaceutical operations on account of its intense germicidal action, the absence of odour or taste in dilute solution, its non-poisonous nature, and its volatility. It has been stated that milk may be preserved by formaldehyde, and the antiseptic subsequently driven off on boiling or cooking the milk. The influence of formaldehyde on vegetable colours is well illustrated in the following experiment. Two samples of infusions of Rose-petals were set aside, one containing 1-10 minim formaldehyde solution per fluid ounce, and the other without any addition. After six weeks they were examined. Both were covered with a thick layer of mould. In the one containing formaldehyde the colour was unchanged; in the other it had been completely destroyed by the growth of fermentative bacteria. Mr. DRUCE said the paper suggested to him a method which he adopted some few years ago for preserving flowers, in accordance with a hint which he got from the herbarium at Borlin. He took a solution consisting of two parts of sulphurous acid and one of methylated alchohol, and having immersed the freshly-gathered flowers in it until the red colour was entirely bleached, they were then shaken and dried in the ordinary way, and as oxidation proceeded, the colour gradually came back again until the original tint was regained, and it then remained permanent. He had specimens gathered six years ago which were fairly good yet. It occurred to him that probably the solution of formaldehyde either alone or in conjunction with methylated spirit would answer the same purpose, and he should certainly try the experiment."

FIRE IN COVENT GARDEN.—In a recent number of the Echo occurs a timely warning as to the probable results of a fire in the precincts of the market. Every morning, and particularly on Tuesday, Thursday, and Saturday mornings, all the streets in the vicinity are so blocked with market waggons and other vehicles that it would be an extremely difficult matter for a fire-engine to effect a passage. Let those who wish to know what the state of affiirs is, endeavour to effect the passage in a "Hansom" on market morning—or even in the afternoons.

FUNNEL-SHAPED LEAF OF CAULIFLOWER.—Colonel EDMINGTON obligingly sends us an excellent example of a funnel-shaped leaf. The basal lobes in place of being separate remain in union one with the other and form the funnel. We have rarely seen a more perfect example.

THE SELLY HILL COLLECTION OF ORCHIDS.—We learn that the fine collection of Orchids formed by Chas, Winn, Esq., at The Uplands, Selly Hill, Birmingbam, passes in its entirety into the hands of Messrs, Charlesworth & Co., of Heaton, Bradford. The collection embraces some of the finest things in cultivation, and notably a grand form of Cattleya Mossice

Reiucckiana, the yellow and white Cypripedium callosum Sanderse, and C. Lawrenceanum Hyeanum, the true C. insigne Sanderre, and another yellow form which is in the size and form of its flowers superior, it being the yellow form of the C. insigne Chautini class. It was named C. insigne Dorothy. The chief feature of the collection is the almost innumerable hybrid Orchids, rai-ed by Mr. WINN, and which includes a great number of fine and novel crosses, which may be improved strains of wellknown hybrids, brought about by careful selection of the best forms for crossing, for it was always Mr. Winn's argument that rather than use any but the best varieties for seeding, a cross had better be left untried. The Hybrid Cypripediums raised at Selly Hill, on those lines, of the C. x Leeanum C. x Lathamianum inversum and other showy types, are thus as much new plants to-day, from a florist's point of view, as they were when originally sent out. That Mr. Winn should give up the collection of Orchids which has been his chief pastime and pleasure for so many years will be a surprise to many. but he is unable to give the unremitting care to the work in the future that he has done in the past, and he therefore determines to part with the collection, as a whole, to those who make a business of the culture of such things, while they are in their present condition, rather than by neglect allow them to get into bad condition.

"No WARRANTY EXPRESSED OR IMPLIED."-How far the disavowal of responsibility may be a legal exemption to wholesale firms in regard to the correct definition and description of seeds or other produce they supply is occasionally the subject of dispute and litigation. The circumstances of a case bearing upon the point have just come to our knowledge. It appears that a retail firm A. ordered of a wholesale house B, a quantity of seed of a choice variety of a certain plant. The seed was delivered and invoiced to A, as the variety ordered but when the seed had been distributed and its character proved, instead of being of the choice variety, it was inferior, and not more than half as valuable as it should have been. A having sold the seed, his customers are suing him for damages. B. admits a mistake was made in regard to the seed, but denies responsibility, on the ground that his firm uses the usual protective notice, and it is printed on each invoice. A, contends that B, did imply that the goods were true to name when B. involced them under that name. The question is an important one. Is B. hable to pay damages to A, for the mistake mole? and can A recover anything for loss of custom he has sustained through it?

PUBLICATIONS RECEIVED .- Botanic Gardens. Grenada: Bulletin of Miscellaneous Information, No. 2, vol ii., contains an abstract of Dr. Morris' lecture on the Bahamas, and of Professor Carmody's paper on the "Industrial Resources of Trinidad,"-Agri Horticultural Society of Madras: It port of Annual Meeting, 1893 1896, and Proceedings of the Swinty, January March, 1896. -Vermont Agricultural Experiment Station: Bulletin No. 49 contains reports and figures relating to Potato blights, their prevention and cure. -Rulletin of the Botanies' Department, Jameira, June, 1896, contains notes on the care of young Vines, on budding Orange trees, and other subjects of importance to tropical agriculturists. -A descriptive account of Jersey; an interesting account of the island, with numerous figures. It will be particularly interesting to horticulturists, as containing an account of Mr. Becken's imperial nurseries .- Bits of Laperionce on a Sussex Favor, A. F. PARRURY .- The Mushroom; how to grow it for Profit, by John Comean, Rotherham.

MADRESFIELD COURT GRAPE AT CLANDON PARK.

When the Earl of Onslow's gardener, Mr. H. W. Blake, exhibited Madresfield Court Grape in such fine condition at Richmond on June 24 last, and carried off the first prize for "blacks" with such

ease, it was felt by those who saw the bunches that the grower had got a practical knowledge of the requirements of the variety, and did it wonderfully well. Many otherwise excellent Grapegrowers find numerous troubles to beset the culture of this Grape. The accompanying illustration (fig. 35, p. 194) shows the character of the Richmond bunches, and yet these were by no means the best that Mr. Blake has had, for later on there were on the single Vine of the variety, in a mixed house, several noble bunches weighing some 3½ lb. each, and of 14 inches in length. Not a symptom of cracking was to be seen, and none has ever troubled the berries since the present gardener took the Vines in hand. The berries were fine, very even, and richly-coloured. Higher praise of the variety it would be difficult to give. The one house, some 40 feet long, and of the usual height and width, is planted with blacks, Hamburgh and Madresfield Court, and of whites, Buckland Sweetwater and Mrs. Pearson. Vines were started in February, and of course all were treated alike. Black Hamburgh ripened first, followed by Buckland Sweetwater, Madresfield following, and Mrs. Pearson, a thick-skin Grape, here of really fine flavour, and which should hang late if needed, coming latest. The entire period of maturation was about five weeks. Thus, for a mixed house, from these varieties an excellent succession is assured.

The Mrs. Pearson bunches, though less heavy than those of the Madresfield, were very compact, tapering, handsome, and well finished. Next to Muscat of Alexandria, and evidently as seen here much more easily grown, this fine white Grape is entitled to take high rank. The Vines were planted nine years since, and when Mr. Blake took to the place a few years ago, hardly a bunch of any sort was produced. Finding the border inside (for the Vines have free run in and out) to be very dry, he gave two heavy soakings of water, and this seems to have performed good service in swelling the buds and maturing the wood. Also some liquid-manure from the cow-yard, weakened by the abdition of six times its bulk of water, was given occasionally; and still so strong was it relatively, that the ammonia, whilst benefiting the Vine foliage, destroyed the leaves of Gloxinias. The necessity for keeping plants in the vinery, obviously does not assist in the development of fine Grapes; therefore, the good results obtained are all the more creditable.

It is interesting to learn that Mrs. Pearson having plenty of pollen, and being therefore a free setter, pollen from that variety is employed on the bunches of the Madresfield Court. In all respects ventilation and treatment are of the ordinary kind. The outside horder is coated with leaves in the winter, and when removed in spring, it is found that roots have been freely attracted to the surface. Then a light sprinking of Thompson's Vine-manure, a good watering, and a thin mulching of straw litter are most beneficial. Occasional dressings of this manure and liberal waterings are also given to the inside roots. A. D.

HOME CORRESPONDENCE.

Without declaring the cel-worm to be the worst amongst the list of our garden enemies, I may say that its acquaintance is by no means desirable. Certain plants are more susceptible to injury from this cause than others, and none more so than the Gorbana and Cucumber. My first experience with the cel-worm was several years ago, in the case of some Gorbanias on the back wall of a lean-to plant-house. At first the plants grew strongly, and produced flowers of large size, but they soon began to disclosely. An examination of the roots showed knotted swollen hores, the work of the unseen celworm. Thinking that the exec sive dampness of the soil, caused by the moisture in cintained in the house, might be the cause, a much more porous material was substituted. This answered somewhat better, but was never a success, and after a while the attempt to grow plants in an unsuitable place was abandoned.

The Gardenias are now grown where there is plenty of light, and quite close to the glass, which is never shaded, the compost being loamy soil full of fibre. The drainage is good, and copions supplies of water are given frequently. For several years the plants have grown and flowered well under these conditions. An average sample of the growth is enclosed to show its vigour. [Very satisfactory, and flowers extra large, Eb.] The above experience has convinced me that if Gardenias are grown in a suitable place they will not readily be attacked by eel-worm. The only experience I ever had with eelworm attacking Cuenimoers was once, when, partly as an experiment, the plants were given a deeper border, and more adhesive rooting material than usual. The bed in which they were planted was supplied with bottomheat from hot-water pipes, over the covering of which on previous occasions a good layer of porous material was placed before putting in the soil for the plants. On this occasion the compost was put on the slates. For a time they grew strongly, producing exceptionally good fruits. I noticed that the roots were extra thick and more fleshy than usual, and after a time the plants began to fail. The roots became such a continuation of knotted excrescences that there was never healthier or finer. Beets are as large as they ought to be, and all roots are good. Caterpillars are affecting the Brassiea tribe somewhat. All winter vegetables are growing rapidly. A better year than 1896 has been so far cannot be wished. P. Middleton, Wynnstay Gardens, Denbighshire.

OAK ALYN, WREXHAM .- Referring to the illustration given in your last number, I may say that the residence of Edwin Stanley Clark, Esq., dates from the year 1656. Passing through the conservatory you enter a large billiard-room, and by a very simple contrivance the table is lowered in a few seconds into a pit below the floor, thereby making the room available for a ball-room. This system of stowing away the billiard-table is the patent of Mr. Clark's. Leaving the billiard-room by a central door, you enter a corridor nicely furnished with elimbers and flowering plants; passing up two flights of steps, the fruit-room is at the top; each shelf is made in moveable sections. On the left of the fruit-room you enter the vineries, two in number: passing from the late vinery, you reach the Orchid-house (shown in your illustration), of which the centre plant is a giant, recently imported, of Lælia elegans with fifty bulbs, twenty-six with

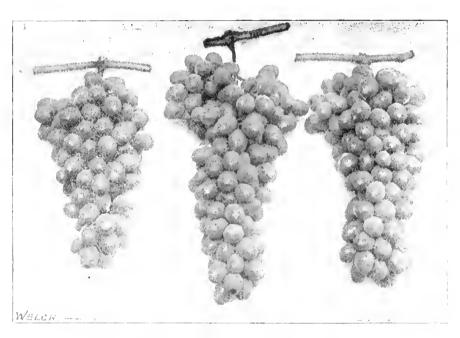

Fig. 85.—Madresfield court grape, as grown at clandon park. Much reduced ,

no mistaking the cause. They were promptly rooted out, and the previous method of planting readopted, with the result that no injury has been done by celworms since. J. MacDonald.

PEACHES AS OPEN-AIR STANDARDS. -- With reference to "C. H.'s." letter in your issue of last week, may I corroborate his views on Outdoor Peach stundards! I planted out Hales' Early four years ago, and it has borne and ripened good fruit ever since. Alex. Hutchinson, Major-General, Owthorpe, Bournemouth, August 11.

BRITISH HERBS AND THEIR USES. - It will be something new to most country-bred people to read in Mr. Fletcher's letter that the eating of Searlet Runners is of modern origin. I know from memory that they have been eaten in West Norfolk for up-wards of forty-eight years, and they were nothing new then to the old people who were living then. Then, again, if I am not greatly mistaken they are mentioned as an article of food in Culpepper's Herbel, which must have been written upwards of 200 years ago, W, B.

THE SEASON.—All varieties of vegetables here have done well. We beat all record in gathering Pers from out-of-doors on May 22. We had also new Potatis. Globe Artichokes and Cauliflowers on the sume date. The late varieties of Broccoli have overlapped the Cauliflowers a long way. Autumn-sown Onions well ripened off, and spring Onions were leaves. It has twelve leads, many of them showing sheaths. Other fine specimen Orchids are in this house, with a goodly number in flower. All the houses are lighted throughout with the electric light, and are so arranged as to furnish a nice promenade. The photograph is by Messrs. Geo. Smith & Co., South Parade, Bradford. E. J. E.

THE "KEW" WEED, GALINSOGA PARVIFLORA. Many of our common weeds are really obnoxious and troublesome to eradicate, some from their easy growth by multiplication of seraps of stems and nodes of creeping grasses, and from the production of numerous seeds, such as Charlock, Chickweed, Groundsel, and the coarser sorts, such as Burdock, Buttercup, Goosefoot, Mayweed, and Thistle; so bad, indeed, was the latter in the time of Linnens that he wrote of it:—"Vitium agrorum apud nos, primarium est "(it is the greatest pest of our fields), and still we hear the harsh epithet of "cursed" often applied to it. Our American friends say of some English weeds as they come across them—"It is a foreigner of a bad type," and only such an expression in an extra superlative degree would express the conduct of the exotic Galinsoga, which appears to be a garden-escape from Kew, as all round that neighbourhood it has naturalised itself in such densely abundant quantities that it completely smothers every seed-bed. The plant in appearance very much resembles the annual Mercury, but differs very widely in having a capitulum or flower head like a small Mayweed. It belongs to the family of Composite, and like the Feverlew

produces myriads of small seeds of easy germiproduces myrads of small seeds of easy germination, retaining their vitality in deep soil for a long period. The name, Galinsoga, was given to it by Ruiz and Pavon, to commemorate M. Galinsoga, physician and botanist at Madrid; it is a native of Peruvian America, and akin to G. trilohata, a hardy annual of little merit. Mr. A. A. Black noticed and wrote about it in 1870, but otherwise none of the local floras have any record of it, as in the case of the sub-merged aquatic invader (Anacharis) of the Irish canals, carried by the Gulf Stream, and now naturalised. Great care must be taken to keep the land clean, to prevent the Galinsoga from maturing, or the old proverb of "One year's seeding makes nine years weeding," will require some cyphers after the nine to express the time for eradication, as only the greatest rigilance and energy will speil its semination. Jain Murison.

THE FRUIT CROPS.—There is one class of people which we may rest assured will take no harm; these are the middlemen; they make ample profit, and this they do no matter whether the season's returns, as regards the growth of ereps, be good, bad, or as regards the growth of crops, be good, bad, or indifferent. Not very long ago, a middleman wrote in defence of his calling, that the salestmen there were all young men, thus, unwittingly, expressing a plain confession that they were all able to retire before they grow into old men. I wish the same could be said of the hardworking gardener and farmer, amongst whom may be found many white-bearded old men, working out life to the end, without the slightest chance of retiring to enjoy even a short afternoon of well-earned rest. The middleman, from the very commencement of the world's history, seems to have been doing a roaring trade. We first read of him as making his appearance trade. We first read of him as making his appearance in the Garden of Eden. Burns also had his eye dead upon him when he wrote.

"Lang sine in Eden's bonny yaird, When youthfu' lovers first were paired, And all the soul of love they shared, The raptured hour. Sweet on the fragrant flowery swaird, In shady bower. Then you, ye auld snee-drawing dog, Ye came to Paradise incog., And played on man a cursed broque-Black be your fa'!
And gied the infant world a shog
'Maist ruined a'."

H. Miller, Combe Abbey.

SOCIETIES.

ROYAL HORTICULTURAL.

Avorse 11. The usual fortuightly meeting of the Computters was held in the Drill Hall, James Street, Westminster, on Tuesday last There was little indication that the holiday se ison is now at its height, for the display was an extensive one, and the attendance good. In common with the meetings that have taken place throughout the summer, the show on this occasion was comprised largely of hardy cut flowers, which are exhibited at the present time so persistently, and it may be added, so well. In addition to the miscellaneous collection of such plants, Messrs. Kelway & Sons displayed an exhibit of Gladioli in the extensive manner common to this western firm.

One of the exhibits most worthy of remark was a group of hardy Bamboos from Messrs. Jas. Veitch & Sons, which, by r ason of its comprehensiveness, was a useful object-lesson to persons not Lamiliar with the variety of foliage and habit of growth that a good collection of these plants presents. As will be seen below, many plants and flowers called for awards from the Orchid and Floral Committees. Fruit was not extensively shown, but several awards were made. Mr. C. T. DRUERY gave an interesting and illustrated lecture in the afternoon upon "The Generation of Ferns."

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs, Jno. Fraser, H. B. May, H. Herbst, R. Dean, J. Jennings, J. F. McLeod, R. M. Hogg, Chas. Jeffries, Thos. Peed, W. Bain, H. Selfe Leonard, H. J. Jones, Jas. Walker, H. Turner, Geo. Paul, and H. Cannell.

From Mr. Sharp, Fareham, was exhibited a dozen plants of Abutilon Silver Queen. They were bushy little plants, and the leaves were almost wholly cream-coloured, there and the leaves were amost windy clean surface in any of the plants (Award of Merit).

Messrs. Jas. Veiren & Song. Royal Exotic Nursery, exhibited a new strain of Streptocaypus, obtained from crossing

previous hybrids with pollen from S. Wendlandii. The thowers are large, and the strain, to be known as Mrs. Heal, promises to be a useful one (Award of Merit). Some plants, well bloomed, of the bright-flowered Rhododendron multicolor Ruby, were shown, and an ornamental-leaved Begonia, named Princess Charles of Denmark.

Messrs. Jas. Verren & Sons also exhibited a very the group of Lamboos, in which were represented specimens of most of the species now in cultivation. First-class Certificates were awarded to Bambusa palmata, a plant possessing a bold habit and handsome appearance, and to Phyllostachys Kumasanca, a very distinct plant from the former. It has a rather dense-growing habit, dwarf, reddish-brown stems, and smaller leaves.

Messrs. Paul & Sons, Cheshunt, received an Award of Merit for a white flowering variety of Clematis viticella named alba. An Award of Merit was also obtained by Mr. A. Lister, Rothesay, who exhibited a very superior variety of Sidaleea malvætlora var. Listeri.

T. Hamilton Fox, Esq., Keston, Kent, gr. Mr. London, exhibited numerous flowers of a variety of Clove Carnation,

named Arthur Seames, with very large flowers. Sir T. Lawrence, Burford, Porking (gr., Mr. Bain), exhibited flowers of Crimum Powelli, C. P. alba, and C. Makoyanum or Moorei, all of them hardy and very ornamental.
